THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb. . . . . .

EFFINGHAM HOUSE,
ARUNDEL STREET, STRAND,
LONDON.

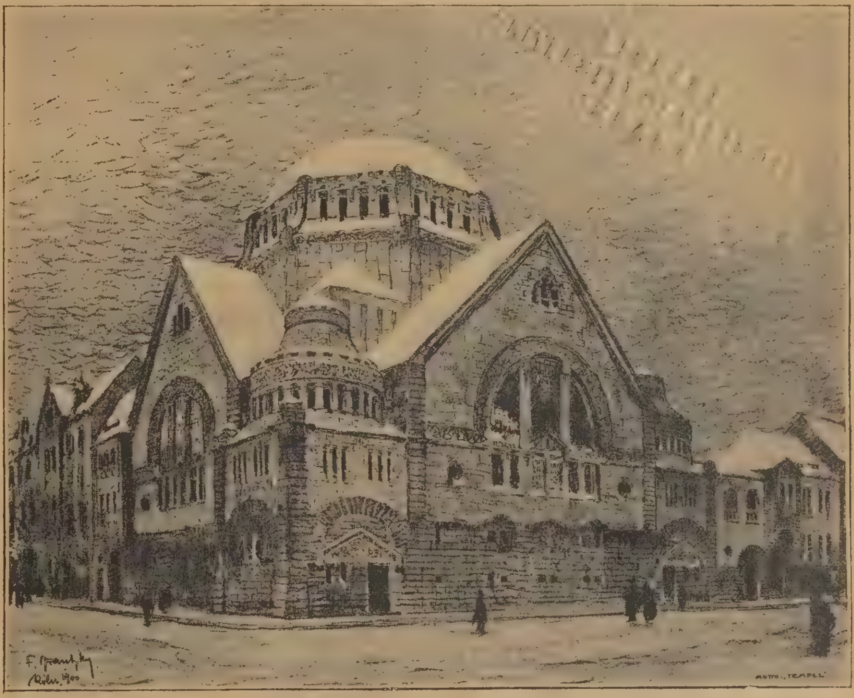
An Architectural Causerie.

Conclusive. MR. LEONARD STOKES, as one of the executors of the late Mr. Brydon, has come forward with facts which completely nullify the contention that the Government did the right thing when they decided to complete the new Government offices themselves. This view of the case was voiced by the "A.R.I.B.A." who wrote to the "Times" expressing the conviction that the appointment of an architect of note to complete the building would be detrimental to the best results, as he would find it "irresistible to impress his own personality on the superstructure, and we should not then have the building as it would have been carried out by the late Mr. Brydon himself": it being further contended that the officials of the Government were not open to the same temptation, and consequently fitter persons to superintend the work. There is doubtless *some* measure of truth in this argument, but the whole question depends on what was the actual condition of the drawings at the time of Mr. Brydon's lamented death: this is the crux, and the statements made by Mr. Stokes at this juncture conclusively prove that the opinion held by "A.R.I.B.A." is entirely erroneous. Mr. Stokes says that the drawings when handed over to the Office of Works were but incomplete drawings for the carcase of the building. Two-fifths of the fees due to Mr. Brydon on the whole building were paid for these drawings; therefore Mr. Stokes reasonably considers that three-fifths of the works which Mr. Brydon was employed to do remains to be done by someone. For various reasons Mr. Brydon had been instructed to obtain tenders for the carcase only of his building first, leaving all finishing for a second contract; but the drawings for this first contract even were not completed when he died. Mr. Stokes, while expressing the desire that the building might be erected without variation from the original design, says that this is practically impossible, "as enough evidence of his (Mr. Brydon's) intentions does not exist, so that someone must take up the work and give the five or six years of constant attention to it which Brydon would have given had he lived." There are a number of ½in. scale details, but many of these were hurriedly made to help the quantity surveyors to obtain a tender, and Mr. Brydon himself would be the first to admit that these drawings required very careful reconsideration and revision. Moreover, Mr. Stokes asks whether it is wished that "this hurried work (necessarily so at this stage under modern conditions) should be perpetuated, or whether one would not rather see it revised and amplified by some sympathetic hand?" Again, who is to see to the second contract and design, the finishing and fitting up of this huge carcase? Surely an architect of standing? "Brydon had personal friends in the Office of Works for whom he had the greatest regard, and so have I, and yet I happen to know that the Office of Works is about the last office he himself would have gone to to finish his great work for him." The last remark carries a world of meaning, and yet Mr. Akers-Douglas, in order to effect "a considerable saving," decides to place the work of completion in the hands of the Government officials—that is to say, in the hands of Sir John Taylor and Mr. Henry Tanner. We think from what has been stated that it is now very clear that a gross error has been made: but even now it is not too late to rectify it.



DESIGN FOR THE SYNAGOGUE AT DÜSSELDORF. F. BRANTZKY, ARCHITECT.

Modern German Architecture. WE publish this week two illustrations of modern German architecture, one on this page and the other on page 9. The competition design for the synagogue at Dusseldorf exhibits many of the good qualities to be seen in the work of some of the best German architects, though it also possesses the vagaries which have given rise to the question, "Is architecture gone mad in Germany?" That there is justification for this doubt, one needs only to inspect the designs published in the German architectural papers, the dominant feature of which designs seems to be an unhealthy craving after novelty. Carving is applied in an amazing manner, the scale being appallingly wrong; decoration is spread over the walls regardless of restraint or propriety; and a hundred-and-one novelties are introduced, not because they are the logical outcome of requirements or because of their intrinsic fitness, but by reason of the insensate craving of men who are architectural sots. Yet it would be unfair to range all under this category, for there are among the German architects men of large calibre, with ideas born of to-day which they are capable of expressing with commanding and admirable skill. Of a truth our own architecture can bear criticism, and it is open to question whether it is not better to have a wild new fancy than a conglomerate of dead dulness and incompetence; and it needs careful discretion not to fail to appreciate the merits of a new conception when shrouded in a style to which criticism is unaccustomed.

The New Cathedral at Westminster. COLUMNS of particulars have already been published on the new Roman Catholic Cathedral at Westminster, but in order to appreciate the magnitude of the structure one needs to see it. At the present time Mr. Bentley's cathedral is very far from being complete, though we understand that the inaugural services are to be held on the Feast of St. Peter and St. Paul in June next. The outside, with the exception of the great tower, is practically finished, but inside much remains to be done, and the peeps one obtains of superb marble columns enveloped in boarding only tends to heighten the contrast between the finished and the unfinished. Great semicircular brick arches rise from the high piers, and above them the domes extend, giving to the whole building a splendid feeling of spaciousness. The lighting is not "dim religious," but floods in through the tinted glass set high up in the walls, such abundance evidently being provided in order to enhance the mosaic and marble which will eventually constitute the lining of the building. Immense sums of money have already been spent on this great cathedral, more than £50,000 having been paid for the site, but when the decoration is reached the cost will be enormous, for the design has been fashioned to give the greatest effect to the Roman ritual, and this effect is to be heightened by a gorgeous display of colour and gold on the walls. It is impossible to judge the building in its present incomplete state, but we certainly congratulate Mr. Bentley on the great breadth of effect which his cathedral possesses.

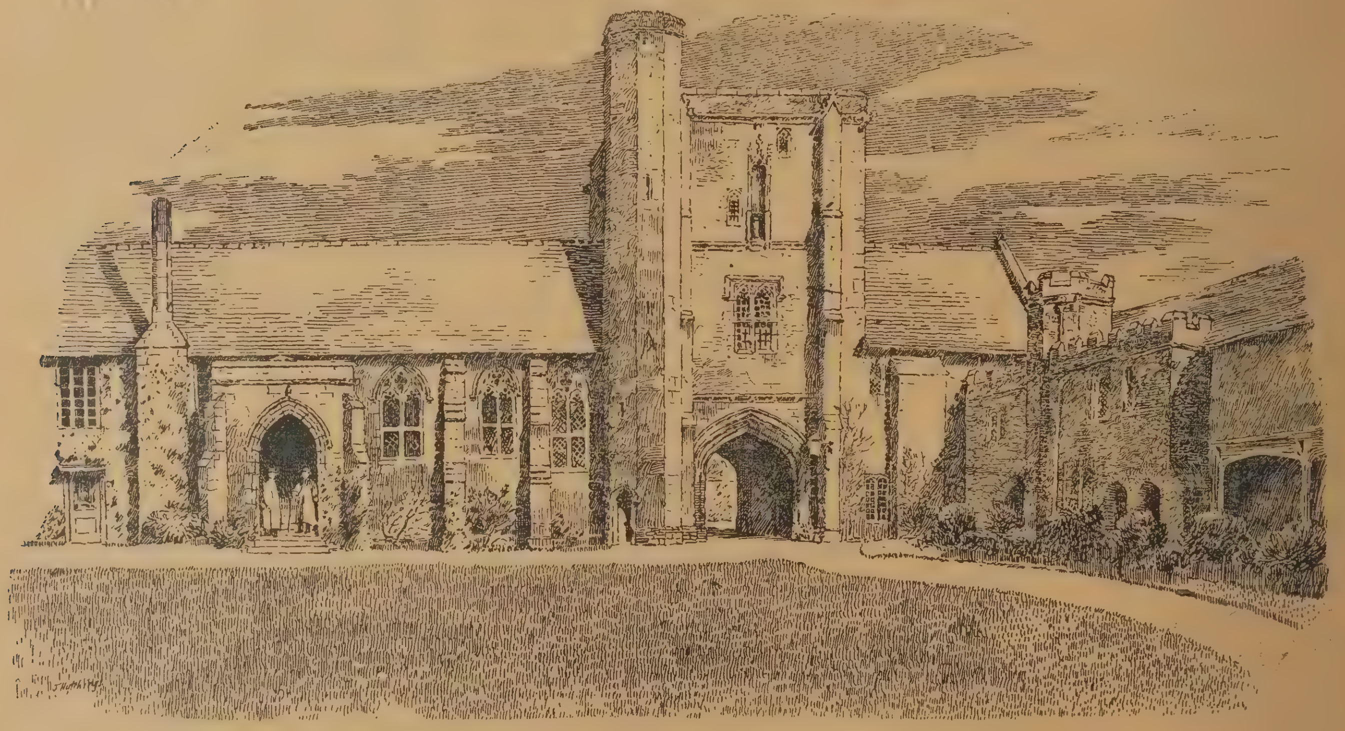
THE HOSPITAL OF ST. CROSS.

By JOHN HUTCHINGS, A.R.I.B.A.

PERHAPS few persons, save the professional gentry of the road, are aware that the bona-fide traveller is entitled by virtue of a very ancient charter to demand at the porter's lodge of the venerable Hospital of St. Cross the traveller's dole, consisting of a horn of ale and a piece of bread. Such, however, is the case, and this ancient custom has survived, together with many others, more showy perhaps, but also of more questionable value.

St. Cross, about a mile from the cathedral city of Winchester, the old-world capital of England, is situated in the luxuriant meadows through which the fertilising waters of the Itchen wander, now this way and now that; and as if loth to hurry through such verdant pastures it parts several times into dual streams, which pursue their several ways only to merge again into a single channel lower down the valley.

This hospital, intended for the support of aged and deserving poor, dates from the twelfth century, and is interesting as an attempt to grapple with a problem that effectually baffles our most able legislators and politicians to-day. Owing to the growing socialism of the times, or to the magnitude of the evil, the difficulty of providing a fund for the superannuation of the poor has been raised beyond the individual and is now regarded as the duty of the State. Such was not the case in the Middle Ages. Then Christianity was a living vital reality, and the Church insisted that every indigent brother, be he nobleman or slave, having once been admitted to the true fold, was in the eye of the Supreme of equal value. And though the socialistic organisation of the early Church was not considered practicable, next to faith and generosity to the Church the giving of alms for the alleviation of suffering and the assistance of the needy was regarded as the highest virtue. Chivalrous knights paraded the country succouring the helpless and maintaining some semblance of law, order and justice; the monasteries had their guest chambers and infirmaries and denied admittance to none; the lord of the manor, though his hospitality was to be accepted with caution, kept open house; and pious men and women devoted vast sums of money to the relief of distress and the building of churches and monasteries.



THE QUADRANGLE, HOSPITAL OF ST. CROSS, WINCHESTER. DRAWN BY JOHN HUTCHINGS, A.R.I.B.A.

This spirit of responsibility for the welfare of the unfortunate, perhaps combined with a desire to atone for past shortcomings, was responsible for the existence of the Hospital of St. Cross. This institution was founded as far back as 1132 by De Blois, Bishop of Winchester, grandson of the Conqueror and half-brother to King Stephen, who commenced the present fine Transitional Norman church, together with a number of lodgings and other apartments which have long since perished or been replaced by later erections. The founder's object was to provide homes and maintenance for thirteen poor men "so decayed and past their strength that without charitable assistance they cannot maintain themselves, who shall have continual habitation in the hospital, and be provided with proper clothing and beds suitable to their infirmities." Their daily allowances were specified in detail in the original charter, and a stipend was provided for the master and other officials. Moreover 100 neighbouring poor were also to be entertained to dinner every day in the hall, named in consequence hundred-mennes-hall, and the surplus of the revenues was directed to be expended in furnishing doles for other indigent persons.

It is curious to observe that each of the inmates was to receive 1½ gallons of beer daily, and the hundred poor 3 quarts each, and on certain festivals more liberal quantities of food and drink were to be dispensed.

The establishment was to be maintained by the emoluments of several rectories and by pensions to be contributed by others; and in Wykeham's time the annual receipts amounted to between £300 and £400.

De Blois, anxious to ensure the success and prosperity of the institution, vested the Brethren of the Hospital of St. John with the guardianship, but this sacred order, probably regarding the charity as a means for supporting the soldiers rather than the needy brethren of Christ, quarrelled with Bishop Toclive, the benefactor's immediate successor, and repudiated all episcopal authority. After an appeal to Papal jurisdiction the Hospitallers were obliged to relinquish all control, and the hospital again came under the direct care of the Church.

With sound administration, the increasing revenues were sufficient to feed an additional hundred poor in the dining hall, but abuses, from which no charity is exempt, soon made their appearance, and we next hear of the funds being perverted to the private uses of the masters and stewards, to the injury of the inmates and the utter neglect of the outside poor.

John de Edington, nephew of the Bishop of Winchester of that name, was among the worst offenders, and on quitting office he removed the whole of the stock and everything of value he could lay his hands upon. The next master, William de Stowell, exchanged his official position with Roger de Cloune for a Yorkshire rectory, and Cloune immediately proceeded to enrich himself at the hospital's expense with the evident intention of making as much profit as possible during his tenure of office. And but for the appearance of a champion of the sterling worth, capacity and resolution of Wykeham the hospital might have ended its career of usefulness at this time. Happily the rapacious scoundrel, in spite of tenacious opposition, was obliged to refund the full amount of his depredations and to pay in addition the cost of legal proceedings.

Wykeham's time and that of his successor were the palmy days of the institution. The latter—no less a man than Cardinal Beaufort—not only attended to the proper administration of the funds, but enriched them very considerably, rebuilt the hundred-mennes-hall, and erected the whole of the buildings of the west and north side of the quadrangle. Besides this, he founded in 1444 a separate establishment with accommodation for two priests, thirty-five brethren and three sisters, calling it the almshouse of noble poverty, *i.e.*, Domus Elemonfinarea nobilis Paupertatis; by which it is inferred that the donor intended it to be an asylum for decayed gentry.

This period of prosperity was of short duration. Already the leaven of corruption had entered into the monastic system; the new learning had made sufficient headway to discredit the old theories, and men having received merely enough to distrust the creed of their fathers became a prey to doubt and unbelief, without rudder or compass on a sea of scepticism. New ideals formed slowly, and in the meantime egoism, self-seeking and time-serving marked the state of unrest, the interim between one faith and another. The institution fell upon evil days, and its condition depended upon the character and capacity of the governor in charge.

During the Commonwealth John Lisle ruled the charity and was succeeded by Cooke, the solicitor to Parliament. The former was husband to Alice Lisle, who incurred the enmity of the implacable James II. for harbouring fugitive rebels and suffered the extreme penalty. Her attainder was reversed by the Parliament of William and Mary. Lisle, the regicide, fled to Switzerland the free, the asylum of the outcast, but died by the hand of an assassin, instigated by the reward offered by the revengeful James.

In 1667 Henry Compton, the celebrated fighting bishop, held the mastership for some years and signalised his term of office by erecting the wooden cloister and brick gabled projection on the east side, which bears his name inscribed upon a stone tablet below the upper window.

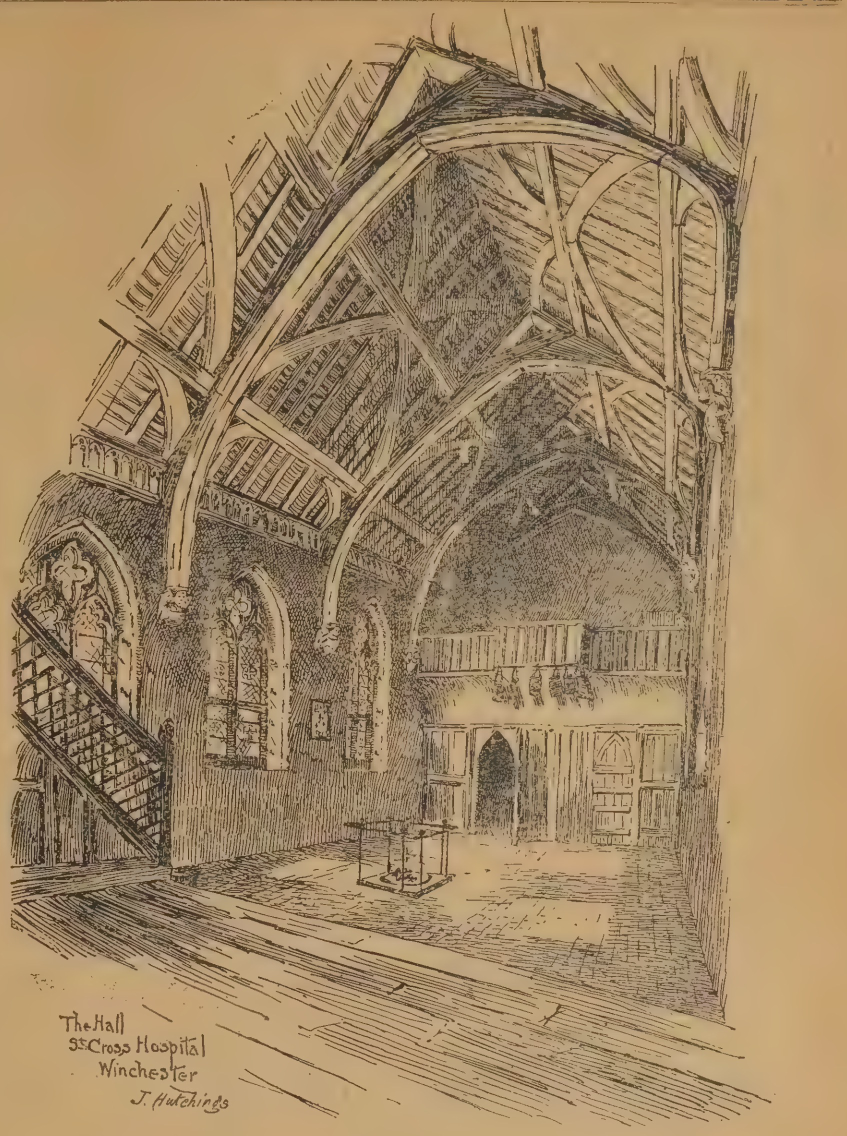
In 1696 the master's residence was greatly enlarged at the expense of the inmates' lodgings, the south side of Beaufort's quadrangle was razed to the ground, and systematic neglect suffered the greater portion of the remaining buildings to become dilapidated and ruinous. Happily a revived interest was taken in these ancient institutions about sixty years ago, and both foundations are now under the control of the Charity Commissioners. Under the improved régime thirteen old men are maintained in the hospital and are provided with the quaint costume instituted by the Knights Hospitallers. Four representatives of noble poverty are also supported by annual payments of ten pounds each, and they, too, wear the dress prescribed by Beaufort the founder—namely, a red robe adorned by an embroidered cardinal's hat and tassels.

The existing buildings form three sides of a quadrangle, with the fine Transitional church of St. Cross enclosing a portion of the fourth side. On the north stands Beaufort's tower, under which is the entrance, and adjoining it the hundred-mennes-hall and the master's residence. The west wing contains the lodgings of the inmates, also Beaufort's work. The cloister on the east, with the infirmary above, belong mainly to the seventeenth century.

The quadrangle is laid out in straight paths enclosing neatly-kept lawns, surrounded by flower borders and shrubberies; in the centre a moss-grown sundial indicates the passing hour and forms in this asylum for the superannuated a fitting symbol of the brevity of human existence.

The effect of passing from the outer world into this quiet retreat, full of eloquent mementos of our remote predecessors; this sanctuary, consecrated to peaceful old age and declining years; is soothing in the extreme. At one's feet is the cool green sward, edged with a band of bright-coloured flowers, and above rise the grey weather-stained walls of the buildings, with their architecture so simple yet so full of dignity, so varied and suggestive yet so majestic in the utter absence of all apparent effort, all unhealthy straining after effect. The skyline and proportions are admirable, the relation of void to solid perfectly harmonious, the detail elegant and appropriate—in short everything satisfies the eye, and the construction is plainly indicated without ostentation. Each apartment suggests its use, and the spectator sees at a glance which is the hall and which is the master's residence, that here is the church and there unmistakably the cottages of the inmates. And to add to this old-world feeling, and to complete the picture, the figures of men bowed with age totter along the paths, or sun themselves in groups, dressed in the long black coat of the Hospitaller and bearing upon the breast the badge of the order, a silver cross patée.

The entrance gateway, or Beaufort's tower, is a fine specimen of Perpendicular architecture, containing above the archway the founder's chamber. Of the same date is the hundred-mennes-hall, a handsome apartment of four bays lighted by Perpendicular windows with traceried heads, and spanned by an open timber roof of bold, simple and massive design. Over the porch is a minstrels' gallery, and at the other end of the room is the daïs, raised a few inches above the main floor-level. At the south-west corner a wooden stair gives access to the founder's chamber in the tower. There is no mantelpiece in the hall, but a charcoal fire in a brazier in the centre of the room remains the only means of heating the apartment, whence the smoke finds an exit as best it may, no provision having been made for it; and the louvre turret in the centre of the ridge designed to serve the dual purpose of chimney and ventilator, so common a feature in the halls of a later period, is wanting in this instance. A number of old leather jacks hang suspended from the gallery front. On the jambs of the windows may be seen the hinges intended to support the wooden shutters, which kept out the wind and rain at a period when glass was so costly as to be considered a luxury of the rich, and was even carried about by them from house to house and fitted into the windows of their temporary abodes.



The Hall
St Cross Hospital
Winchester
J. Hutchings

The kitchen is of ample dimensions, having an enormous fireplace capable of roasting a whole side of beef and fitted with a smoke jack of the old pattern. The master's house adjoining has been much modernised, and sash windows occupy the place of the mullioned lights of a former period. The domiciles of the inmates consist of two rooms, a pantry and a garden in the rear. This wing was built by Beaufort, and was probably intended for the accommodation of the order of noble poverty.

Compton's cloister is perhaps the most picturesque portion of the institution, being quite a patchwork of materials. The walling of red brick and flints set in rectangles is very beautiful in texture and full of rich colour, and the projecting gable breaks the straight line of building very pleasantly.

The church is a noted specimen of Transitional work, in excellent preservation, and is also curious as an almost perfect specimen of the Greek cross plan. The cloister wing abuts against the north transept, and in order that the inmates of the infirmary might take part in the services a window was constructed in the gable wall looking into the sacred building. Our illustration shows the aspect of the church from the south-east, rising from luxuriant meadows and surrounded by a fine group of elms. The celebrated triple arch is indicated in the same drawing, which gave access to a cloister, of which no vestige remains.

The interior is interesting as exhibiting the growth of the style during the construction of the building. The side aisles are lighted by small round-headed windows; the piers of the arcades are huge cylinders, crowned with capitals of true Norman type, but the arches they support are pointed, although some of the aisle vaults retain the semicircular form. By the time the triforium was reached, a further development had taken place, and here the pointed arch is used, awkwardly it is true, and as if the builders were still experimenting, but the mouldings are smaller and more deeply under-cut. The nave clearstory windows are Decorated, the west window is a good example of the Early English geometrical period, and the roof was reconstructed by Bishop Edington about the middle of the fourteenth century. The eastern portion of the choir is pure Norman, and would seem to be the oldest part of the structure.

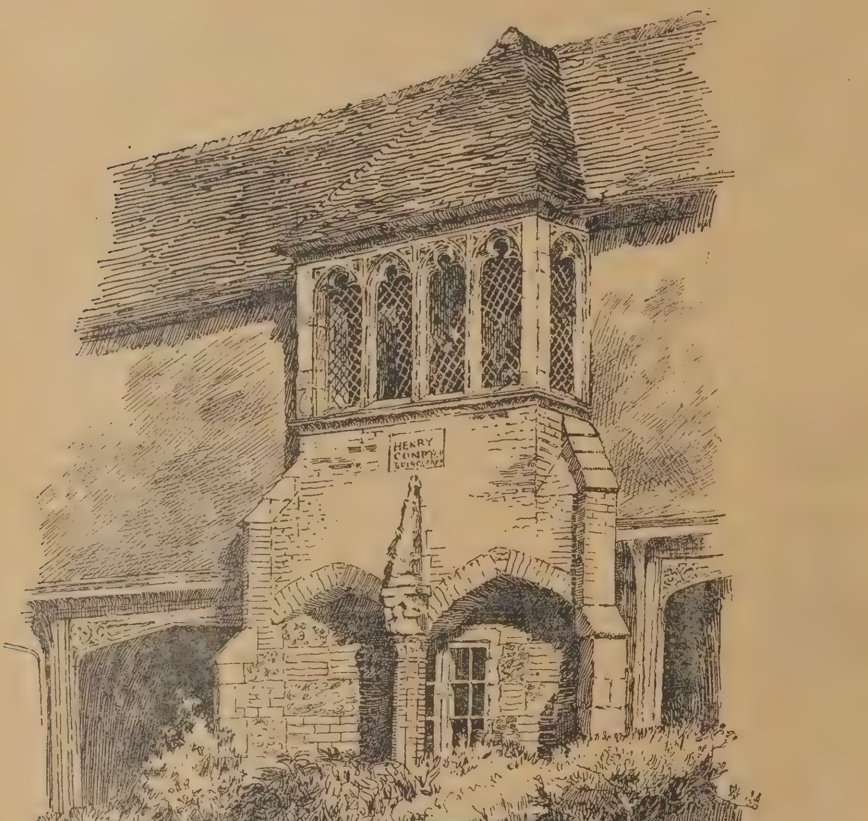
The interior is lofty, massive and well proportioned, and abounds in good detail, so that the effect must have been singularly impressive and beautiful. Unfortunately the church had the misfortune to fall into the hands of Butterfield, the great Gothic enthusiast, who considered that because traces of colour were to be found on the structure it was his duty to repaint it as nearly as possible in the same style. If the decoration is a true repliqué of what a mediæval church used to be, the twentieth-century critic can only marvel that men who could construct so superbly, and with such breadth and masterly skill, should have been so absolutely deficient in true feeling for colour decoration, and he can only hope that with the extinction of the Gothic purist the desire to colour our ancient cathedrals and churches after this model will entirely disappear. If the ancient fabric had been handed over to the modern house-painter, with instructions to spare no expense, the effect could scarcely have been more heartrending. We may thank Heaven, though it is almost too late, that our eyes are at last opened to the vicious depredations of the restorer of the old school, and we may be pardoned for regarding this measure of enlightenment as a proof of some progress in art education and culture.

The spirits of bygone worthies still seem to hover over the scene of their earthly strivings, anp are brought home to us in mottos and memorials. Some of the fourteenth-century tiles bear the legend "Have Mynde." On a window you may read: "Orate pro anima Richardi Buteshull." He was master in 1346. Wykeham's and Cardinal Beaufort's arms decorate the roof. On the walls of the gallery over the cloister wing Robert Sherborne, afterwards Bishop of St. David's and later of Chichester, inscribed the words "Dilexi sapientiam R. S. 1503."

Among those connected in the past with the Hospital of St. Cross two names stand out most prominently, namely, Bishop Wykeham and Cardinal Beaufort. History informs us that both of them were rapacious, possessed of splendid retinues, were arrogant in manner and amassed large sums of money. The world contains many such to-day. But we have evidence other than historical of how they expended much of the money for which they were condemned, and how they exercised the power that made them objects of envy. Wykeham, the great architect—who built and endowed among other establishments Winchester College, the prototype of the English public school; also New College, Oxford, and furnished it with a charter that entirely revolutionised the effete systems of teaching previously in vogue: who, while engrossed upon works of this magnitude, yet took care with incalculable pains that the revenues of an obscure charity like St. Cross should be properly administered and the buildings renovated and restored: who, while engaged upon such an engrossing and gigantic undertaking as the rebuilding of the western limb of Winchester Cathedral, whose majestic proportions still known as Wykeham's nave are the admiration of posterity, should at the same time have clothed and fed numbers of poor scholars, who but for his bounty would have been forced to have relinquished the pursuit of knowledge for a mere dull struggle for existence in the commoner walks of life.

It is curious too, and reveals a redeeming human trait in his character, that Beaufort, the wily and unscrupulous politician, the educator of princes, the elegant courtier and stately cardinal, should occupy his spare time and money in founding and endowing a charity for decayed gentlemen and for the assistance of his needy brothers and sisters.

As if in testimony of the abiding worth of noble actions the good deeds of history appear far more potent and far-reaching in their effects than evil deeds. When the latter are absolutely forgotten the good that was done some hundreds of years ago still remains a boon and blessing to mankind. It is the prerogative of time to decree what shall survive and what shall perish, and to preserve for future fame whatever bears the impress of truth. If only our modern millionaires would cast aside their selfish egoism, and recognise the responsibilities of wealth, determining to discharge their obligations worthily we might expect a revolution beyond parallel in history for far reaching effects and beneficial results. We should see literature, science, inventiveness and all noble pursuits become a power amongst men; we should see art etherealised, extended, exalted, converting the deadly dulness of our cities into the enchanted loveliness of fairyland; and even the man in the street might learn to play his part intelligently and become a thinking rational creature, not unsusceptible to the seductive spell of beauty, the refining influence of culture. Such men would richly deserve a name and a place in history well worthy of comparison with the grand old Wykehams and Beauforts of old.



THE COMPTON CLOISTER, HOSPITAL OF ST. CROSS, NEAR WINCHESTER.

YORK ARCHITECTURAL SOCIETY.

VISIT TO GILLING CASTLE.

On August 10th the members of the York Architectural Society journeyed to Gilling, where they wended their way along the woody eminence to the castle. On the eastern terrace, in front of the oldest portion, Mr. John Bilson, F.S.A., gave an address on the building and its owners. In the basement is a blocked doorway, in the arch of which are shields bearing the arms of Etton, the then owners of Gilling. This doorway communicated by a central passage with rooms on either side, all having barrel vaults. At the other end of the passage is a flight of stone steps which led to the upper apartments. A monument in the south aisle of the church may commemorate Thomas de Etton, the builder of this fourteenth-century tower-house. From the Ettons the property passed into the hands of the Fairfaxes of Walton, one of whom, Sir William (son of Sir Nicholas, whose tomb is in the church), made considerable additions to the castle. To him is due the beautiful dining-room. In the eighteenth century the west front with wings was added from the designs of William Wakefield, architect, of York.

The party proceeded to the west front and ascended the steps to the entrance. In the hall an oak screen designed by the president of the society (Mr. C. H. Channon, F.R.I.B.A.) attracted attention. The dining-room was entered, and its painted glass and heraldry described by Mr. Bilson. The room is perhaps the finest Elizabethan room in the country, and is 39ft. 5in. in length, 22ft. 2in. wide and 17ft. 3in. in clear height. It is panelled in oak to a height of 12ft., and there are seventy-five panels inlaid with varied ornament and enclosed by mouldings carved with egg and tongue ornament. Surmounting the panelling is a painted frieze on which is a series of trees representing the Wapentakes of Yorkshire; on the trees hang shields of Yorkshire gentlemen living at the close of the sixteenth century who were entitled to bear arms. Altogether there are 449 shields. The room is lighted by three large windows enriched with painted glass depicting the Fairfax heraldry, and partly the work of Bernard Dininckhoff (1585). The bay window emblazons the arms and descents of the Fairfaxes, that in the south window those of the Stapletons. The glass in the other window is of rather later date, and contains the arms and descents of the Constables. The imposing fireplace is enriched with heraldry. The ceiling is of plaster, ribbed, with pendants.

The basement was inspected, and afterwards the rooms of the later additions designed by

Wakefield, including the long gallery. On the motion of the president (Mr. Channon) a hearty vote of thanks was accorded to Mr. and Mrs. Wilson for their kind permission in allowing the castle to be inspected. The church was subsequently visited under the direction of Mr. Bilson.

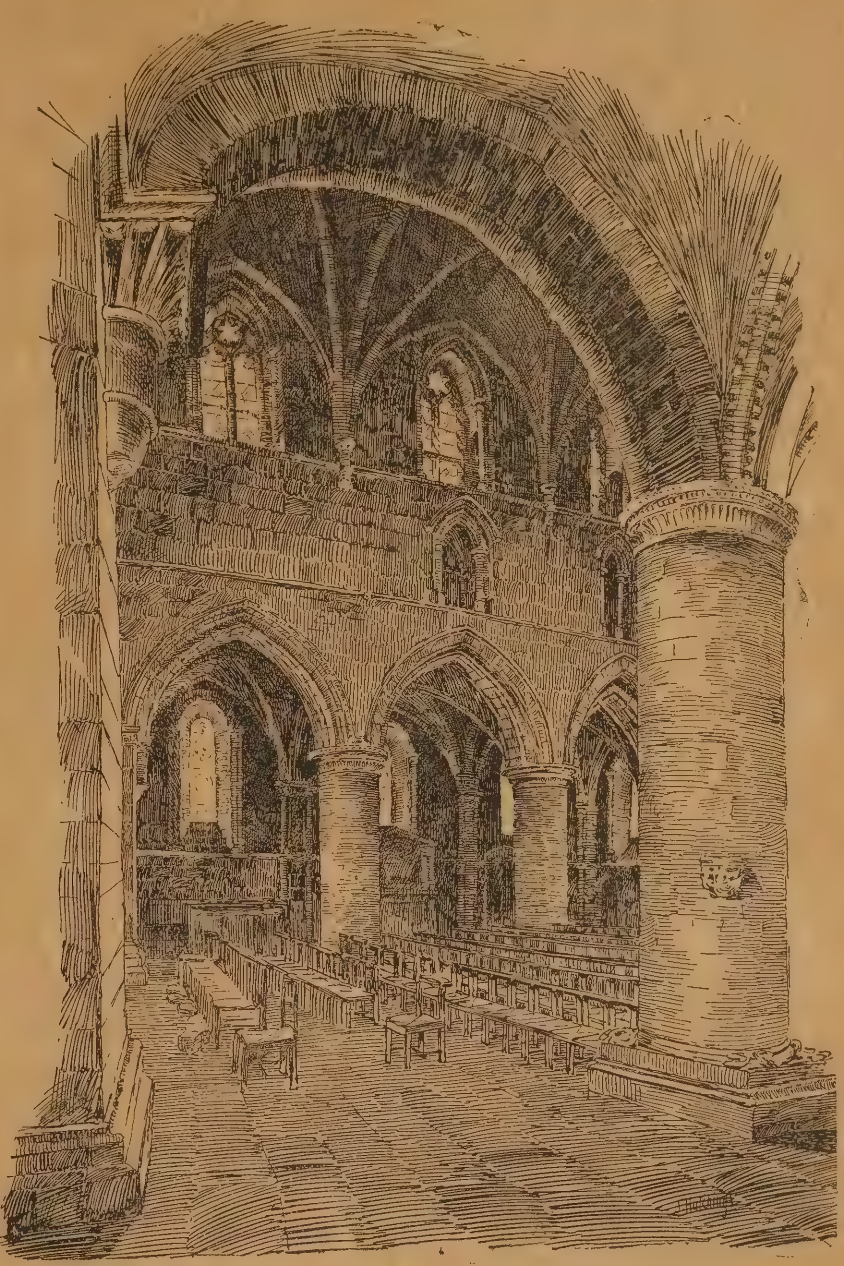
THE IMPORTANCE OF SECURING GOOD WORK.

WE have been amazed sometimes at the easy-going way in which architects will accept tenders for work intrusted to their care. One would almost think they had but slight understanding or appreciation of their responsibilities in regard to the practical outcome of their work. The importance of the result is not to be measured merely by the satisfaction of one's client. The attainment of that may be a comparatively easy task, for clients as a rule cannot be expected to entertain more than a general and superficial idea as to the real character and value of the work from a practical point of view. An architect to a large extent builds up his reputation, we know, by giving satisfaction to his clients; he enhances it considerably by making his work command the appreciation of his fellow architects and of builders by reason of practical excellence in all the details of the finished result. And scarcely secondary in importance is the self-consciousness that this complement of excellence has been the result of a faithful and diligent exercise of personal care and attention upon the actual carrying out of the design.

Naturally one of the prime essentials to a successful issue is the employment of a satisfactory contractor. How much depends upon this any architect of experience knows full well. It is next to impossible to insist on good work with a cheap contract or a doubtful contractor. No architect can confidently or rightfully expect the best of work and materials at a price which does not reasonably admit it. But the client apprehends no difference; he looks to the architect to secure the best result, whatever the price or conditions of contract. Therefore, when an architect, willingly or unwillingly, entertains a contract or contractor in whom he cannot have the fullest confidence he assumes a responsibility which is no mean addition to his legitimate functions as supervisor of the work.

There are cases, however, in which other considerations than the mere question of cost is taken into account by clients. Sometimes it is desired to give a local contractor the preference, simply as such. This of course may seem right and proper in its way, but in a country place where perhaps a good house is to be erected in which everything is to be of the best an architect will usually find it absolutely necessary for the ensuring of good work and materials to employ a contractor of whom he has intimate business knowledge, and who is acquainted with the particular character and quality of the architect's design. An engineer of our acquaintance, who makes it a matter of personal pride and satisfaction to allow his name to be associated with no sanitary scheme which is not carried out in the most thorough and complete manner down to the minutest detail, complains sometimes of having to employ local contractors in country places. He argues that the firms he usually employs know exactly what his specifications mean, and are so used to working under his instructions that he knows he can be perfectly certain of thoroughly satisfactory results; whereas in the case of the local man he generally has to instruct him in regard to every detail and to see that every instruction has been actually carried out, thus entailing an extra amount of care and responsibility on his part alike unnecessary and irritating. And even then the chances are that the work will not be nearly so well or quickly finished as if one of his own selected contractors had undertaken the contract.

Where an architect may be compelled by stress of circumstance to employ a contractor of whom he personally has no knowledge, it behoves him to be specially careful in the oversight of the work, and providing the terms of the contract are in his opinion reasonable—that is, fair to the client and just toward the contractor—to see that it suffers in no detail by deviations from the specification. There is nothing unreasonable in seeing that you get what you pay for when buying an article in a shop, neither is it derogatory to an architect's professional reputation to see that a contractor duly fulfils his obligations. In fact, this is practically just what the client pays the architect for, and in this way it becomes his imperative duty to see that it is done. As we have said before, where the architect knows his contractor and can repose the utmost confidence in him his burden of responsibility is very much lightened. Under other circumstances he incurs an unknown risk, against which he must of necessity take extra precaution.



INTERIOR OF CHURCH, HOSPITAL OF ST. CROSS, WINCHESTER. DRAWN BY JOHN HUTCHINGS, A.R.I.B.A.

The insistance upon good work is by no means so thorough-going in the majority of cases as we should like to see it. We could name a few architects whom we know as having a mind of their own in regard to this question, and whose work is evidence in itself of the patient personal attention which has been bestowed upon the supervision of its execution. On the other hand there is a sort of idea abroad that a kind of passable standard may be accepted—a standard which cannot be called really bad or inferior, but which certainly cannot be designated first-rate. No greater mistake could be made by a young architect than to let such a notion get possession of him. The best is always the best, and the best reputation—the reputation most to be desired—is built up by the best work. "Good workmanship," said one of the most gifted of modern architects, "has been in every age the very foundation of good architectural design." We believe most emphatically that it is more than ever so to-day. There is nothing better than the best and nothing cheaper than that which lasts the longest and wears the best: which remark, in spite of its being something of the nature of a platitude, is the central principle of all that is sound and good in building.—"Architecture" (New York).

A Larger Town Hall for Westminster is needed, the city affairs having outgrown the municipal buildings—still known as St. Martin's Town Hall. A big scheme of extension is being inaugurated. This provides for a new upper storey and the carrying back of the building beyond its present wall. The interior will be rearranged. The work will take eight months; the cost will be £10,000. The city officials are using temporarily the old town buildings in Caxton Street.

THE NEW CASTLE OF KILDRUMMY.

MR. AND MRS. JAMES OGSTON have taken up residence in the new Castle of Kildrummy, which has been in course of erection for the past two or three years, and is now almost completed. Concurrently with the building of the new house and the construction of a stone bridge which brings the old and the new castles into direct communication, Mr. Ogston has taken measures to preserve the ancient edifice, though he attempted nothing in the way of restoration. Dangerous portions have been strengthened, the exposed tops of the walls covered with cement so as to prevent disintegration of the binding material, and loose stones replaced.

Old Kildrummy Castle has not only engrossed the special attention of antiquaries from the fact of the ruin being, if not the largest, at least one of the largest, among ancient castellated structures in North Britain, but it has also been of great interest to all students of the annals of Scotland from its stirring historical associations. The remains also show that the castle—once the palace of kings—had not only been of great extent, but of much architectural magnificence. The castle is situated in the gorge of the extensive valley through which the Don finds its way to the eastward, and which, expanding to the north, reaches almost uninterruptedly to the base of the "Tap o' Noth," in Strathbogie.

It is built of hewn stone—a fine freestone; but although Aberdeenshire is marked for its granite, it by no means follows that this material had to be brought from a distance. It was long conjectured, and is now conclusively proved, that the cream of the buff-coloured freestone used was got in the immediate locality. The plan of the structure is that of the old baronial fortification—round towers at the angles flanking retiring screens, with a gateway between two other round towers. These circular towers, as the remains indicate, rose from a broad base slanting slightly inward, and forming an outline both of beauty and strength.

Kildrummy is also unique among the castles of Scotland from the fact that a chapel forms a conspicuous feature. The "Snow Tower" towards the west was identified by Dr. Jamieson as the Snowdon of Barbour which King Edward dilapidated. It is 55ft. in diameter. The great hall in the northern part of the building, still to be traced with accuracy, was oblong in shape, measuring 73ft. by 40ft. The chapel measured 35ft. by 20ft., and had a great window to the east, which is still preserved. The eastern front, including the towers, is 180ft. long, the northern 262ft. The distance from the chapel window to the nearest wall of the "Snow Tower" is 200ft.

The new castle has been built from designs by Mr. A. Marshall Mackenzie, A.R.S.A., of Aberdeen. The bridge connecting it with the old castle is an almost exact reproduction of the old Brig o' Balgownie further down the Don.

The new castle is more in the style of an old English manor-house than a Scotch castle, partaking of the Elizabethan character with its outlying terraces, prominent gables, mullioned windows, stepped parapets, and tall chimneys grouped in masonry in the picturesque form to be seen in such typical English residences as Haddon Hall. The building measures over 100ft. each way, the main front, which faces the ravine and the ruins, being 108ft. long. It rises from a high terraced garden constructed on the edge of the valley. The chief front consists of a one-storey portion in the centre, flanked on either side by a two-storey wing with high gables and oriel windows. A main building connects these two wings in the rear, and shows a gabled projection in the centre. The entrance door is situated in a massive tower which rises to a height of about 50ft. and terminates in a flat roof with stone parapet. The beautiful cream-coloured freestone found on the estate has been used. The quarry from which the stone was got is indeed so close to the new house that the stones might have been swung by the cranes out of the quarry into the dressing sheds. The stones are in 7in. courses, with two courses to one corner stone. A notable feature of the front are the corbelled oriel windows in the two wing gables. These windows terminate in battlemented balustrades in harmony with the centre building. The interior of the entrance porch is lined with freestone ashlar, with floor of the same material, the joints of the stones forming a geometrical pattern. From the porch runs a spacious corridor traversing the whole length of the house to the west side. The corridor is 86ft. long and 12ft. wide. The walls, ceiling and floor are of oak, the last being in parquetry. At each end there is a large oriel window. Opening off the corridor towards the front are the library, billiard-room and drawing-room. The drawing-room is L-shaped with two oriel windows, one to the south and one to the west. It has a richly-designed fibrous-plaster ceiling in the Adams style, delicately and gracefully executed. The billiard-room occupies the central space in the one-storey building already referred to. The staircase is of oak, with a close balustrade of carved panels instead of the usual open balusters. The dining-room is situated on the west front, and is a spacious apartment with oak floor and ceiling and high dado. The kitchen and domestic offices occupy the rear of the ground floor and are extensive and complete in every way. Underneath the main floor are cellars, bicycle house, &c., the latter having a convenient entrance from the lower terrace. The upper floor is occupied with bedrooms, dressing-rooms and bathrooms. The whole castle is lighted by electricity produced by a dynamo on the premises, and a new supply of water has been provided from a copious spring nearly two miles distant. A large stable has been built not far from the castle, with coach-house and coachman's house. One of the striking features of the grounds is the main gateway, a specimen of wrought ironwork executed by Treasurer Bisset, Aberdeen.

BRICKMAKING IN SOUTH AFRICA.

IN many brickyards in South Africa making is done chiefly by hand. In the pit benches are worked up in rows. The negroes dig the clay and shovel it into a wheelbarrow and dump it into the pug mill; that is, the wheelbarrow is emptied at the pug mill and from there the clay gradually shovelled into it. The pug mill is usually worked by one horse; sometimes two horses are employed.

In the pit are two men. A negro pulls clay sufficient for one brick from the pug mill and brings the lump of clay into some shape. The white man next to him slings that into the brick form or mould, strikes off the surplus with a straight edge, knocks out the brick and lays it on a board near by. Another black man sands the brick at both sides and wheels the boards with bricks to be set up at the drying ground or shed. That white man gets about £20 a month, not less.

There is no standard size for bricks, but as most of the brickmakers are English they keep more or less to the English sizes. On the whole the African bricks are very rough, and vary greatly. Here are some of the sizes:

	Inches.
Stock brick of the Ferreira	9 × 4½ × 3
Firebrick of the Ferreira	8¾ × 4¼ × 2⅝
Stock brick of Johannesburg Brick Co.	8¾ × 4¼ × 2⅝
Firebrick of Johannesburg Brick Co.	8½ × 4⅜ × 2¾
Stock brick of Franco-Italian Co.	9 × 4¼ × 3
Stock brick from other companies	9 × 4¼ × 3

These are all solid bricks, with sometimes a small recess on one of the flat sides.

At the Franco-Italian Co. they also make bricks of other dimensions. The size 2⅝in. by 4¼in. by 9in. is much liked. Their ring kiln is about 40ft. by 120ft. They also make the small square floor plates or tiles, and there will be a good market for such tiles all over Africa. They have small re-presses with the respective patterns, and a special auxiliary kiln for such ware.

A description of a plant erected early in 1899 may be of interest. It is owned and operated by the South African Contracting Association. The whole business is in one building of the best workmanship, carried up with best brick, wooden roof trusses and iron roof. The doors fit well. The windows extend to the top of the roof, and can be closed so that all the heat can be kept in. There are movable tramways around the kilns for the purpose of taking on tracks the dried bricks to the kiln and the burned bricks to the outside. The floor around the kiln as far as to the driers is the natural sand or soil. The rest of the floors, as well as of the driers, are of wood. The basement is about 6ft. in the clear, and the joists and beams are supported by square wooden posts. Across the front end of the building is an excavation about 15ft. to 20ft. wide, with two pairs of disc blowers, each pair being driven by a separate electric motor, to blow air into the basement. In the rear wall of the basement are two pairs of disc exhausters, discharging into open well-holes. The brick driers, built up upon the main floor, are light timber structures, covered all around with cotton material. Within are racks upon which the brick are set for drying. The driers are subdivided by cross partitions, so as to cut out any compartments whilst being filled or emptied. The doors, of light skeleton frame, canvas-covered, have no hinges, but are merely fastened by buttons. In the floor of each compartment are trap doors about 15in. square, or rather square holes with wood covers, the principle of the driers being that the blowers and exhausters cause a current in the basement; that the saturated air from the drying brick is drawn through the square holes in the floor and discharged into the well holes; whilst the warm air, the waste heat from the kiln, is passing through the canvas and around the brick, and thus effecting the drying.

The main building is 237ft. long by 137ft. wide. The kiln, with continuous firing, has an inside measurement of 141ft. by 34ft., with walls 9ft. 10in. thick at the base, built of rubble masonry and brickwork lining. The clay is raised in trucks by incline, and at the floor over rolls, tipped and shovelled into the first rolls and to the first pug mill, then to fine rolls and a second pug mill, is forced through an opening 9in. by 4½in., and from there to a wire-cutting table. The whole machinery plant is in duplicate, each half working independently of the other. The pressed bricks are conveyed by wire rope on trays swinging on rope to driers, and are there placed on racks by hand. The draught for driers is furnished by large fans. The kiln gases are conducted to a large central flue by branch flues, each of which can be disconnected from the main flue by dampers. The main flue runs into the base of a brickstack 130ft. high. The kiln will hold 300,000 bricks, and will have for the present a daily output of 20,000, which can be increased by 50 per cent if necessary.

The brick-machine is supposed to make 20,000 to 25,000 bricks per day, requiring 12-h.p., from clay taken from the face without any tempering. The weight of the machine is about five tons. The makers in England also make a smaller size to produce 12,000 bricks per day, with 6-h.p., without hoist.

The press room is well arranged. On the top floor, above the first pair of rolls, is an arrangement consisting of crank disc, crank pin, connecting rod and sliding block to push the clay down, to be taken by the rolls. They have also electric generators for power, for fans and electric light. For small ware they also have an auxiliary kiln. The pressed bricks are excellent, and some are made with square holes through the width, and not lengthwise as in others. The wires will cut off six bricks at a time. To convey the bricks from the presses, the Bleichers wire-rope system is used. The pendants have two shelves, and they run along on the inside line of all the driers. At the open doors of the drying compartments the bricks are taken from the shelves and set up on the wooden racks of the driers. All the kilns working continuous have three rows of pipe on top of the furnace, with caps and sand seals. The fuel (coal) is fed down these pipes.

In the east end of the Rand (sometimes overlaying the gold) there is plenty of coal, and on account of the great traffic a railway, exclusively for coal, is being built along the whole reef, say for about sixty miles or more, to carry coal to all the gold mines, without otherwise interfering with the traffic of the main line.

As a rule, brickyards in South Africa are surrounded by a veritable chaos, with clay pits lots of abandoned pits more or less filled with water, and all sorts of rubbish, hills of waste brick, and a motley population of Negroes, Malays, Hindoos, Arabs, &c.

PAINTING THE TOWER BRIDGE.

THE TOWER BRIDGE, which cost near one million sterling, is being cleaned and repainted. The maintenance of the bridge involves an annual expenditure of upwards of £8,000 and further outlay is necessary periodically for the preservation of the fabric. The work now in progress is being done by contract at the sum of £5,000, that being the lowest tender. The highest was £18,000. The undertaking, needless to say, is, from a mechanical point of view, somewhat difficult, necessitating the making of special arrangements to avoid interference with the traffic, and with the raising from time to time of the bascules. The magnitude of the work may be judged from the fact that it will take some seven months to complete. About 140ft. above high-water mark a wire rope has been stretched, tested to bear a weight of 15 tons. From this rope Palmer's travelling cradles have been suspended, enabling the painters to commence work on the high-level footways. The difficulty of painting the bascules has also been solved by means of the travelling cradles, which will be always kept on a level. When the two portions of roadway are raised the men painting from the travelling platforms will be hoisted into the air, and will be able to continue their work as though nothing out of the way had happened. It is when the painting of the inside of the hydraulic machinery is attempted that danger to the men will arise. The four inside girders of each bascule have to be painted too, and these move in a "quarter-circle chamber" when raised or lowered. The men will be slung in the cradles, and as long as they exercise due care there is no reason why, as the girders ascend and descend, they should not move in perfect safety with them. The bridge, inside and out, will be given three coats of paint. The original colour was a crimson lake. This will now be altered to two shades of green, with a peacock blue for all the panels. No less than 56,800lb. of paint will be required, as well as 300 gals. of varnish, and eighty men will be kept constantly engaged by the contractors, Messrs. Arthur H. Inns.

DRAWN BY JOHN HUTCHINGS, A.R.I.B.A.

Law Cases.

Non-Observance of Covenants.—In the King's Bench Division of the High Court of Justice the case of *Long Eaton Recreation Ground Co., Ltd.* v. *The Midland Railway Co.* was heard recently. In his award Mr. Justice Lawrance said: The defendants own land on the north-west of Springfield Avenue, Long Eaton, which they purchased from grantees of the plaintiffs. The conveyances from the plaintiffs to these grantees contained covenants that they would not erect or permit to be erected any erection or building of any kind except a fence wall not more than 2ft. high with suitable iron palisades nearer to Springfield Avenue than the line drawn on the plan annexed to their conveyance and marked "building line," and would not erect any buildings on the land conveyed other than private dwelling-houses of a certain value with proper conveniences fronting Springfield Avenue, and would not carry on upon the land conveyed any trade or business of a noisy or offensive character. The defendants accepted these restrictive covenants. They have now constructed a railway embankment with a permanent railway upon the land. It is admitted that the embankment encroaches beyond the building line. Instead of a 2ft. fence wall they have erected a post and rail fence nearer Springfield Avenue than the building line, and they intend to run trains along the railway. In my opinion each of these specified acts, if done by a private purchaser of the defendants' land, would have been a breach of the restrictive covenant, for which such a purchaser would be liable to be restrained by injunction. It was argued for the defendants that a railway embankment was not a "building" within the meaning of the covenant. I hold without much hesitation that a railway embankment alone—that is, even without its possible appurtenances, such as signal-boxes, &c.—is a building within the meaning of the covenant, the object of which is to maintain a uniform range of buildings (*Child* v. *Douglas*, 1 Kay, p. 567). But it can hardly be contended that if a private owner were to make and use a railway on this land he would not be carrying on a "business of a noisy character" within the meaning of the covenant. I think that upon all the claims the plaintiffs are entitled to compensation, and I give judgment for them for £650, the amount of the award, with interest.

The Removal of a Sign-Post.—Last week, in the King's Bench Division of the High Court of Justice, the case of *Hoare & Co.* v. *Metropolitan Borough of Lewisham* was heard. This was an action brought to restrain the defendants from removing a sign-post and water-trough erected by the plaintiffs in front of the Marquis of Salisbury Hotel at Lewisham. Mr. Justice Lawrance in giving judgment said that in February, 1899, an improvement in the premises of the plaintiffs being about to take place, it was suggested by plaintiffs' architect to the defendants that the trough should be removed and a drive should be thrown into the roadway to remove an obstruction to traffic, and that the sign-post should be removed to the corner of the street in front of the new house to be erected by the plaintiffs. The question arising was whether the drive was dedicated to the public. In his opinion it was not, and he further held that the plaintiffs were entitled to have the sign-post where they had placed it. Under the circumstances the plaintiffs were entitled to the declaration they asked for, and he therefore found for the plaintiffs with costs.

Builders' Notes.

The Death is announced of Alderman T. Callund, J.P., head of the firm of Callund & Sons, builders and contractors, of Rochester.

Lead Poisoning of Painters is avoided in France by simply substituting white oxide of zinc for white oxide of lead in painting the insides—if not the outsides—of Government buildings.

Death of Mr. John Gurney, of Gloucester.—Mr. John Gurney, of the firm of John Gurney & Son, builders and contractors, of Gloucester, died on August 10th after a severe illness. Deceased was forty-nine years of age.

Mr. Alexander Cargill, one of the best-known builders and contractors in Forfar, died recently at the age of about forty-five years. He succeeded his father in the business about five or six years ago, one of his most recent contracts being the erection of the new fever hospital for the Dundee and Forfar District Committees.

Workmen's Dwellings at Merthyr.—At a recent meeting of the Merthyr Urban District Council seven tenders were opened for the erection of 100 houses at Penydarren, under the Housing of the Working Classes Act, and that of Mr. John Morgan, Blaenavon, at £13,600 being the lowest, was accepted.

Cardiff Builder's Failure.—The first meeting of the creditors of James Seymour Chubb, trading as J. S. Chubb & Co., builders, 72, Metal Street, Cardiff, was held recently at the office of the Official Receiver. In the prescribed summary of affairs the gross liabilities were set down as £6,882 7s.; expected to rank for dividend, £4,385. The assets totalled £1,485 15s. 10d., leaving a deficit of £2,899 4s. No composition was offered.

Building at Oban.—Builders in Oban have been somewhat slack for a year now, but there are indications that trade may be brisker for the coming winter. The most important operations at present are the extensive additions and alterations to the Rockfield Road building of the Oban High School, the contract for which is in the hands of Messrs. Connell & Fraser. The interior of the school is being entirely altered and a large wing added to the north end. The same contractors are about completing a Roman Catholic chapel at Taynuilt, designed by Mr. G. Woulfe Brenan, C.E., architect, of Oban.

America and the Cement Trade.—Manufacturers of cement in Great Britain are awaiting with concern the return from America of several prominent men of Lancashire and Kent. These gentlemen have gone to the United States to look into the secret process of making cement employed by the Americans. The Americans make the same amount of cement in three hours that is made here in three or four weeks. The rotary roasting mills are used, and the cost of manufacture in the States is half the amount spent in Great Britain. A London cement merchant who has just returned from America saw while in New York the manufacturers interested and learned from them that British control of the cement industry was threatened and that the cement manufacturers of this country must adopt the American process or be driven from the field.

American Scheme to buy Belgium Glassworks.—A meeting of the master-glassworkers of Brussels and the American delegates was held recently at Charleroi. The correspondent of the "Journal de Charleroi" at Jeannette (Pennsylvania), says: "It is stated here that Mr. Chambers went to Belgium to form a company to be called the Belgium Window Glass Co., and that the Americans intended to purchase the Belgian factories by paying the proprietors of the works a certain sum of money immediately and leaving them the choice of taking or retaining a number of shares in payment of the balance of the purchase money. The amalgamation would result in economy in working, and would permit of the maintenance of good prices. It is hoped that later on the American Window Glass Co. and the Belgium Window Glass Co. will come to terms whereby the American company will take a certain quantity (about 14 per cent. of the output) of the Belgian glass. It is rumoured here that Mr. Chambers' proposals will certainly be accepted."

Surveying and Sanitary Notes.

The Sanitary Institute will hold its next congress and exhibition in the city of Manchester in the second week of September, 1902, under the presidency of the Right Honourable the Earl Egerton of Tatton.

Value of Land in Southwark.—A new sorting-office is to be built by the Post-Office authorities in the vicinity of Union Street, Southwark. About 38,900ft. of land belonging to the Ecclesiastical Commissioners is required for the purpose, and Mr. R. Vigers sat last week as arbitrator to assess the price. The prospective purchasers placed the value at £23,000 and the sellers at between £29,000 and £32,000. Mr. Vigers reserved his award.

Heating and Ventilating Drury Lane Theatre.—The transformation which has been going on in Drury Lane Theatre for the past two months is now nearly complete. The internal change effected has been very sweeping, but in no respect nearly so radical as in the heating and ventilating arrangements. Three powerful fans driven by electric motors have been introduced. Their work will be to keep the half-million cub. ft. of air within the theatre and stage fresh and pure, and in the winter months up to the required temperature. This they will be able to do, for they are powerful enough to change the whole air of the theatre five times during an ordinary performance of four hours by blowing in 380 tons of fresh air during that time. The air will be purified by being passed in through a coke filter.

The Widening of Blackpool Promenade.—Details are now made known of the scheme for forming a new promenade at Blackpool from the north to the south shore. Plans have been drawn up and powers have been in part obtained for adding 100ft. to the width of the promenade for the whole length from the Metropole Hotel to the Victoria Pier. At first the intention was to add 60ft. only, and powers for this purpose were duly obtained from Parliament last year. The cost of the work was estimated at £350,000. After the Bill was passed it was found that if a convenient up-to-date promenade was to be made, with every accommodation for trams and carriages, an additional width of 60ft. would be insufficient. Hence the recent decision of the Highways Committee to recommend the Council to make the additional width 100ft. instead of 60ft., at an extra cost of about £40,000. This recommendation has been approved by the Council The extra width will be obtained by appropriating some of the foreshore, but the houses will not be interfered with. When the widening is completed the space provided for the public will be 142ft. wide at the narrowest point and about 180ft. at the widest point. A footpath will be made along the east side. Next to this will be a carriage-way 42ft. wide. There will also be an island footpath 10ft. wide, next to which will be the special tram track, 17ft. 6in. wide. The rest of the space will be available as a promenade for pedestrians, who will thus have a walk of a mile and three-quarters from the Victoria pier to the Metropole, and beyond that a further walk of nearly a mile either at the top or at the foot of the cliff-like works at the north.

Work of the Ordnance Survey.—According to the annual report for 1900-1 of the Ordnance Survey Department the South African war has greatly hampered their work. Nine officers out of an establishment of twenty-four have been withdrawn for service at the front; and besides these, two complete survey sections composed of non-commissioned officers and men of the Royal Engineer surveying companies have been supplied for use in South Africa. Although the work done for the War Office has been heavy the main feature for the year has been an advancement in the re-survey of Ireland. Of the 10,475 square miles already surveyed 1,650 were completed during 1900-1. The extreme closeness of detail in this work is shown by the fact that the average area of the "enclosures" on a plan is less than half an acre. Summarised, the progress made up to March last was as follows: Town surveys have been completed for Great Britain and Ireland. Maps (1–2,500) have been completed for Great Britain, together with certain re-surveys of Ireland: 1in. and 6in. maps are now ready of both the above countries. The new series of 1in. hill maps of England and Wales is proceeding; so far 48,122 square miles have been published. And all this has been accomplished with a staff of 2,613 men. The arrangements made for the sale of Ordnance Survey maps through the medium of head post-offices in Great Britain have recently been revised. Those maps may be ordered and indexes inspected at head post-offices in towns where there are no specially accredited agents for their sale. The charge for a single map or sheet ordered through a head post-office will, in addition to the actual cost of the map itself, be in future 3d. instead of 4d., as has hitherto been the case, and an additional ½d. will be charged in respect of each additional map or separate sheet ordered at the same time. On orders for Ordnance Survey maps of the value of 10s. and upwards no charge to the public will be made beyond the price of the maps themselves.

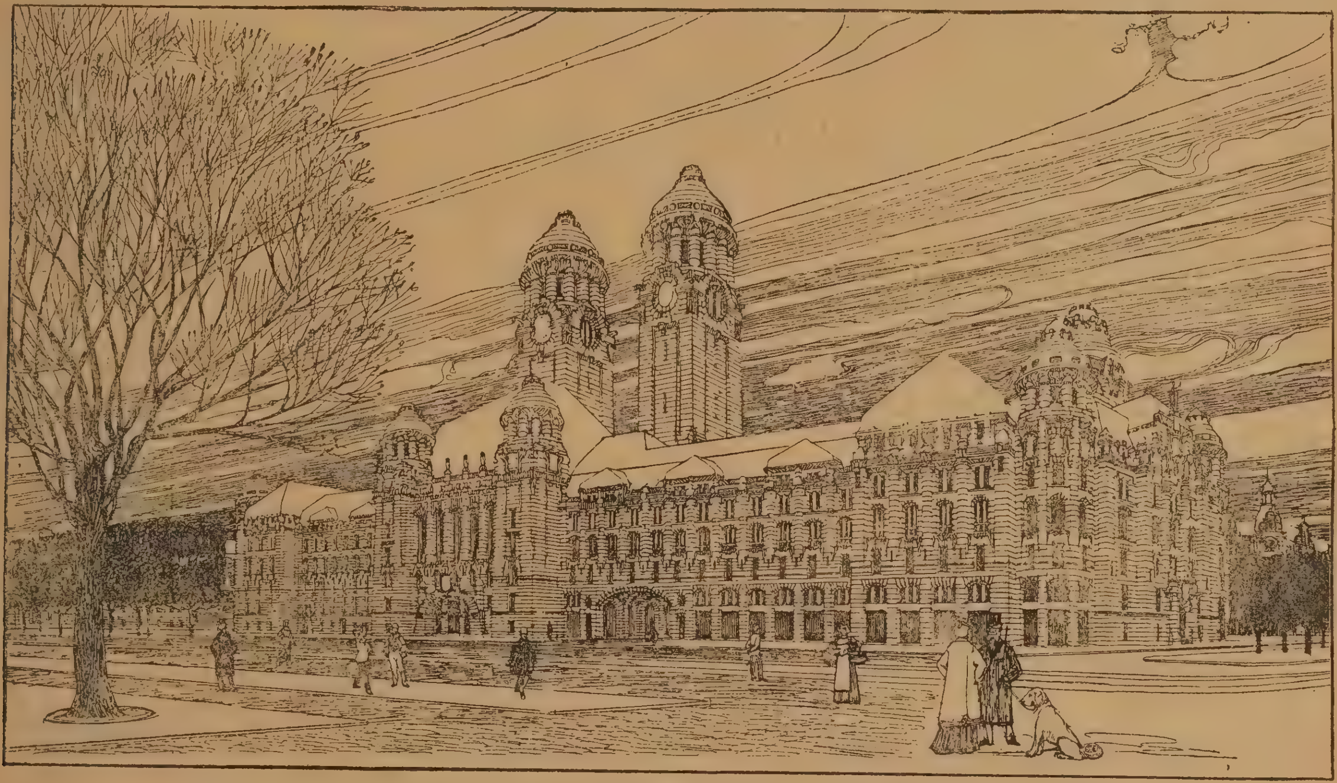
LICHFIELD GRAMMAR SCHOOL.

NEW buildings at the Lichfield Grammar School are being erected on the site at Borrowcop Hill, on the south side of Lichfield. The accommodation in the new buildings will be for 125 boys, twenty-two resident scholars, headmaster's residence, assistant-masters, nurse, and female attendants and servants. The principal entrance to the site, which is eight acres in extent and which has been given by the Conduit Lands Trusts, faces St. John Street. The buildings face the south-east, and comprise on the ground floor school- and class-rooms, master's sitting-rooms, lavatories and changing rooms, cycle house, &c. The science and art department is at the north-east end, and will contain art-room, chemical and physical laboratories, lecture-room, dark-room, stores, &c. At the south-west end the headmaster's residence is situated and comprises drawing-, dining- and morning-rooms, with ample sleeping accommodation over. The common dining hall, capable of accommodating about fifty boys, is placed near the administrative department and the schools. Over the dining hall are the sick ward, nurses'-room, bathroom and lavatories, linen stores, &c. The boys' dormitories are over the main school and classrooms, affording accommodation for twenty-two boys, in two compartments accessible from both ends of the building, and having bathrooms and conveniences attached. Linen cupboards and stores for clothing are provided. All the rooms in the school and science department are to be well lighted and ventilated, and in addition to open fireplaces will be heated with hot water on the low-pressure system. The buildings will be built of red bricks with Broseley red tiles for the roofs, with stone dressings sparsely introduced for the string courses, window heads, &c., the floors being of wood blocks upon concrete, rolled steel joists being introduced in the upper floors. The drainage, water and gas supplies have been given especial attention. The grounds will be laid out for cricket, football, fives courts, &c., and planted as time admits. Messrs. J. Ward & Son, of Uttoxeter, are the contractors. The new buildings will be constructed in accordance with the plans of the architect, Mr. J. H. Pyke.

Broughton Parish Church has recently had a new tower and peal of bells added. The tower, which is a substantial erection of stone, has been built at the expense of Viscount Cross from plans prepared by Messrs. Paley & Austin, of Lancaster. The work in connection with it was carried out by local men, the walling being done by the late Mr. Joseph Balderstone and the woodwork by Mr. James Butterfield. The peal of bells are eight in number, seven of which have been cast by Messrs. John Taylor & Sons, of Loughborough, who have also fitted the same with mountings of the latest and most improved type. The tenor bell was cast by John Warner, and was given by Viscount Cross in 1869 in exchange for an old bell which had become cracked.

THE NEW ART GALLERY AT NEWCASTLE.

LAST week the foundation-stone of the new art gallery to be erected in Higham Place, Newcastle, was laid. The site has been provided by the Newcastle Corporation, whilst Mr. Alexander Laing will, on completion of the structure—which is estimated to cost £20,000—hand it over to the municipality. The site adjoins the free library. The buildings will be two storeys in height, forming on the plan a hollow square: the ground floor consisting of large entrance and sculpture hall and three lofty art or museum galleries extending through behind the public library and lighted from the central court, the upper floor being entirely taken up with top-lighted art galleries, four in number, averaging in size about 65ft. by 27ft. by 27ft. high to the top of the arched ceiling. The main facade is to Higham Place; the corner formed with the free library at the south-east angle is occupied by a tower 23ft sq. and 112ft. high, which contains the grand staircase. The staircase is reached from the sculpture hall, the main entrance to which is about the centre of the Higham Place front. The whole of the floors throughout will be constructed of concrete; in the case of the upper floors, combined with expanded metal on steel joists. The surface of the floor to the entrance hall is to be of tessellated marble pavement, and that of the galleries of polished oak blocks. At the north end of the buildings are provided receiving-rooms, private staircase and picture hoist. The design externally, carried out in polished ashlar, is Renaissance in style, boldly treated, the ground floor forming a rusticated plinth the same height as that of the free library, and upon which are detached Ionic columns projecting out on either flank and carrying the entablature with semicircular arched pediment, under which are sculptured niches. The general height is about equal to that of the library. The main entrance is 8ft. wide, flanked by double detached Doric columns with pedimented entablature and with sculptured figures on either side. Over the arch of the doorway is formed a niche with moulded architrave and twisted shafts on either side. The tower has a deep band of sculpture on the exposed faces immediately under the lantern, the latter being octagonal on plan and supporting a stone dome of about 20ft. diameter. The system of heating and ventilation is that known as the Plenum, the fresh air being driven into the various apartments through trunks and ventilating shafts by means of a fan in the basement, after being purified by passing through a coke screen. In cold weather the fresh air before being delivered into the rooms will pass over a steam battery, also in the basement; the temperature being regulated by valves which permit the cold and warm air to be combined to any desired extent. The inlet-gratings in the rooms will be so arranged as to be entirely clear of the picture surface. Messrs. Cackett & Burns Dick are the architects.



COMPETITIVE DESIGN FOR MUNICIPAL BUILDINGS, DRESDEN. J. REUTERS, ARCHITECT. (*See p.* 1.)

A Y.M.C.A. BUILDING FOR ST. HELENS.

THE scheme for the erection of the new Young Men's Christian Association buildings for St. Helens has recently made considerable progress. In a limited competition for plans those of Messrs. Briggs & Wolstenholme, of Liverpool and Blackpool, who were the architects for the Gamble Institute at St. Helens, have been accepted. The building will be erected on the plot of ground which adjoins the gymnasium, facing North Road and the corner of Duke Street. The site comprises 535 superficial yards, and the building will be in the Renaissance style. The principal feature of the ground floor will be an imposing main entrance 10ft. wide, with two roomy shops on the Duke Street side and five others facing North Road. Through the main vestibule will be a spacious entrance hall, through which entry will be obtained to the present gymnasium. On the first floor there will be first reached an open reception hall, leading to the various rooms. On the left an entrance will be made to the gymnasium gallery, next the secretary's office and private room. A reading-room will look out on the corner of Duke Street, while immediately over the entrance will be a library and parlour for writing purposes. On the right, extending to the end, a lecture hall which may be divided into three by folding doors is planned. The platform will have a permanent lantern screen at the back, and a speakers' ante-room is attached. On the second floor there is to be a lecture-room the same size as the present assembly-room, together with numerous other smaller rooms for caretakers, &c. On the roof flags will extend the whole length at the back, one part of which is intended for a keeper's yard and the other for a roof garden, which will make a retreat in the hot weather.

NEW PRUDENTIAL ASSURANCE BUILDINGS AT BRISTOL.

THE Prudential Assurance Company's new buildings at Bristol form a very conspicuous feature of Clare Street. They occupy a frontage of 43ft. in Clare Street and 35ft. in St. Stephen's Avenue, and also have a frontage facing St. Stephen's Churchyard which is equal to that in Clare Street, so that the offices which they contain are well lighted from three sides. Taking advantage of the position a symmetrical front has been arranged on the St. Stephen's Avenue end flanked by a tower at each angle of the site. The entrance is in Clare Street and leads both to the offices of the Prudential Assurance Company, who occupy the whole of the ground floor and basement, and also by means of a staircase to the suites of rooms on the upper floors which are to be let to various tenants for ordinary professional purposes. The offices of the company are lined with glazed faïence, executed by Mr. A. Whitehead, of Leeds, and the joinery in all these rooms, including screens, counters, &c., is in walnut and mahogany.

Though the site of this new building is not a large one it has been found possible to arrange four good offices on each of the upper floors, together with the necessary lavatory accommodation and coal lift. The exterior elevation is composed of red bricks and terra-cotta, both supplied by Mr. J. C. Edwards, of Ruabon. The base up to the sill of the ground-floor windows is of red granite, supplied by Messrs. D. H. & J. Newall, of Dalbeattie. The roofs, which are worked up into a central feature round the chimney shaft, are covered with North-country slates. The style may be called Renaissance. The general contractors are Messrs. W. Cowlin & Sons, of Bristol. The constructional ironwork came from Messrs. A. Handyside & Co., of Derby. The wrought ironwork, stair balustrade, &c., were prepared by Messrs. Hart, Son, Peard & Co., and the mosaic floors by Messrs. Patteson, of Manchester. Messrs. Belshaw & Co. carried out the electric lighting, and Messrs. A. Walker & Sons, of Leeds, the concrete staircase. The remaining specialists engaged upon the building were—Messrs. Thuffrey & Co. for grates and chimneypieces; Mr. J. Gibbons for ironmongery; Messrs. Morrison, Ingram & Co. for sanitary fittings; and the Crittal Manufacturing Co. for casements. The architects are Messrs. A. Waterhouse & Son, of London, and the whole of the work has been carried out under the supervision of Mr. W. Brock, clerk of works.

New Patents.

These patents are open to opposition until September 24th.

1900. — Crematorium Furnaces. — 12,887. S. WILLOUGHBY, 28, Hyde Vale, Greenwich, and H. H. FOX, 39, Victoria Street, Westminster, S.W. The object of this invention is to effect cremation without the escape of smoke or smell. The crematorium furnace is built in a vault beneath the mortuary chapel, and the requisite heat is obtained from liquid fuel, oil burners being arranged at one end, or at both ends, of the furnace. The spire of the chapel may, if desired, be made to act as a chimney. In the floor of the chapel is a permanent grave, as it were, with a trolley at the bottom on which the coffin would be lowered and taken away.

Gulleys.—16,494. S. CHATWOOD, Crown House, Edenfield, near Bury. The gulley is provided with a ventilating chamber and air-pipe to carry off foul air and deliver it at a safe distance, so as to prevent it being forced through the water seal.

1901.—Combination Sink, Bath and Boiler.—12,296. H. H. HODKIN, Havelock Bridge Works, Queen's Road, Sheffield. This invention is intended for cottage property. It consists of a sink-slab of concrete supported on piers, with a copper boiler at one end heated by gas and a bath carried on rollers underneath. When required, the bath is pulled out and the boiling water allowed to run into it from a tap fixed at the bottom of the boiler. The bath is provided with a waste.

The following specifications were published on Saturday last, and are open to opposition until September 31st. A summary of the more important of them will be given next week. The names in italics are those of communicators of inventions.

1900. — 11,494, JETLEY, road-scavenging machine. 11,953, ATKINS, manufacture of acetylene gas. 13,239, FAJOLE, acetylene gas generator. 14,594, CULLIS & CULLIS, deal and timber transporter. 14,781, BOULT (*Kraetke*), ignition devices for incandescent gas burners, 14,820, GIBBONS, door stops. 14,822, TAYLOR & HUBBARD, excavating machines. 15,267, HILL, ball and float valve for cisterns. 15,822, BROUGHAM (*Weiss*), rotary cutters for wood· 15,874, BJÖRNSTAD, means for controlling electrically-driven lifts, hoists, &c. 16,770, LE MAITRE, wire nails. 17,120, PILKINGTON & ORMANDY, manufacture of bricks and mortar. 17,596, EADES & ALLDAY, crab winches and other appliances. 17,999, COGHLAN, acetylene gas generating apparatus. 22,694, DE LERY, incandescent gas lighting.

1901.—9,166, KELLY, KELLY & PRITCHETT, self-closing mechanism for doors. 10,334, GIEBELER, self-sustaining gear for lifts, &c. 11,045, PFISTER, preserving timber. 11,129, MUNK, device for cooling, moistening and purifying air. 11,353, KOYL, apparatus for softening water. 11,613, THORPE, closet joint connections. 12,749, GUTZWILLER, connecting pieces of parquetry. 12,751, HOOPER, hearth and fire-place fittings.

The Royal Exchange Pictures: Two More Ready—Under the auspices of the Mercers' Company and the Gresham Committee Messrs. W. Cubitt & Co. are preparing a panel in the south-east corner of the ambulatory of the Royal Exchange for the reception of the work of Mr. Edwin A. Abbey, R.A., which is a commission from the Skinners' and Merchant Taylors' Companies, and commemorates the founding of their annual feast. In the reign of Richard III. there occurred a dispute between the companies as to which should take precedence of the other at civic functions. Lord Mayor Billesden (1483) decreed that they should enjoy precedence in alternate years, and should dine together, in token of amity, on the eve of St. John's Day. It is expected that Mr. Abbey's picture and that of Mr. Frank Brangwyn, "Modern Commerce," will be unveiled by the Lord Mayor before his expiration of office.

BIRMINGHAM UNIVERSITY.

The Birmingham Architects' Plea for an Open Competition.

AT the last meeting of the Birmingham City Council, Alderman Beale, Vice-Chancellor of Birmingham University, stated that the misunderstanding with regard to the Birmingham architects was due to a difficulty with Lord Calthorpe. The peculiar conditions under which his lordship gave the site provided that he should approve of everything done, and the promoters had actually to ask Lord Calthorpe to go and see the architects and let them know what he approved of and what he wished. The Birmingham Architectural Association, respecting this, says: "Seeing that the official reply received from the secretary to the University to our protest was 'that in the opinion of the University Council the principle of selecting designs by competition could not be advantageously adopted in the case of the University,' we (the secretaries) are instructed to ask you if you will be good enough to say how these two statements can be reconciled." Alderman Beale replied to the effect that he gave the requirements of Lord Calthorpe as one only of the circumstances which were inconsistent with the principle of competition. "It would not have occurred to me," he continues, "that my statement and the resolution of the University Council required reconciliation. The principle of competition cannot, in my opinion, be advantageously adopted under conditions which impose undefined limitations on the competitors and restrict the freedom of the selecting authority, and this applies to any case where a general power of veto is in the hands of a third party. It should be understood that Lord Calthorpe is relaxing the restrictions which he has heretofore insisted upon for the protection of the lessees of the Edgbaston Estate, but he informs us through his agent that he cannot say to what he may have to object until he sees what is proposed. His approval should, therefore, be secured in the earliest possible stages, and I think it would be impossible to do this in the case of an anonymous competition."

This letter was laid before the Council of the Birmingham Architectural Association, who considered that neither the indefinite opinion expressed by the Council of the University nor the more definite statement given by Alderman Beale at the City Council meeting was a valid reason why an architectural competition should not have been promoted with a view to securing the best design for the new University buildings—because:—

(1) Although the Council of the Birmingham Architectural Association fully appreciate the ability of Messrs. Webb & Bell they believe it is a fact that hitherto they have by no executed work proved their powers in connection with University buildings, whereas other architects have done so with marked success.

(2) Funds for the purpose of the University having been obtained publicly and to a large extent from those connected with and interested in Birmingham and its neighbourhood, the subscribers would naturally desire to give local talent the opportunity to distinguish itself—in proof of which no less than ninety subscribers have sent replies in the affirmative to a circular issued by the Birmingham Architectural Association, and not a single negative reply was received.

(3) Although Lord Calthorpe in presenting a site for the new buildings has a perfect right to lay down conditions, it is scarcely to be supposed that, as his lordship draws so handsome an income from property within the city boundaries, he would desire that such conditions should exclude Birmingham architects from the chance of carrying out the proposed buildings.

(4) As it need have taken no longer time to have procured competitive designs than is likely to be required by a single firm of architects engaged on many important works, the approval of Lord Calthorpe could have been as readily obtained.

(5) Any objection which Lord Calthorpe is likely to make would be for the protection of the lessees of the Edgbaston Estate. Many Birmingham architects who have been employed to erect buildings for such lessees would be better acquainted with the requirements than an alien firm of architects.

(6) However valuable an acquisition Lord Calthorpe's gift of land may be, it is small in comparison with the total sum subscribed, and is in fact less than other individual donations to which no such conditions are attached. It is therefore unreasonable that any objection Lord Calthorpe may have to make should be put forward in opposition to what many subscribers consider would be beneficial to the undertaking.

Further, the Council point out that, if an architectural competition were promoted conditions might be sufficiently defined for the purpose, and the freedom of the selecting authority need in no sense be restricted, "because it is recognised that architectural competition is for the purpose of securing the best considered scheme, and promoters can always provide for any necessary revision of the selected design."

Engineering Notes.

Profitable Municipal Lighting at Bradford.—The municipal accounts of Bradford for the last financial year show a profit of nearly £200,000. The most paying item would appear to be municipal lighting. The gas and electricity are responsible for a profit of £59,000 on an expenditure of £210,000. In Manchester the corresponding profit is nearly £52,000.

The New Street Bridge over the Tyne, between Newcastle and Gateshead, which has been completed at a cost of £80,000, was opened last week. The new structure was built round about the old bridge, which was removed piecemeal, the traffic being thus allowed to continue without interruption. The engineers were Messrs. Sandeman & Moncrieff, Newcastle, and the contractors Sir William Arrol & Co., Glasgow.

Engineers' Congress at Glasgow.—In connection with the Glasgow Exhibition an International Engineering Congress will be held at the beginning of September. The delegates of foreign Governments and members will be received in the Bute Hall of the University by the president (Mr. James Mansergh, F.R.S., president of the Institution of Civil Engineers), on the 3rd. The congress will terminate on September 6th.

Quick Waterworks Boring.—The record for large water borings, which has hitherto been held by Gainsborough (Lincolnshire), is about to be challenged by Lincoln itself. The corporation of that city recently invited tenders for a boring 2,176ft. deep, lined with 30in. tubes for a depth of 400ft. and terminating not less than 12in. diameter. Seven tenders were received for the work, and the corporation, on the advice of the engineer, Mr. Percy Griffith, A.M.I.C.E., F.G.S., of Westminster, have accepted that of Messrs. Charles Chapman & Sons, Ltd., of Salford amounting to £14,605. The time allowed for the completion of the work is four years, but it is anticipated that a shorter period will suffice.

New "Tubes": The Great Northern and City Railway.—Two important underground electric railways are being constructed in London. One will run between Baker Street and Waterloo, and the other will connect the Great Northern Railway system at Finsbury Park with a station at Finsbury Pavement. Of the two the latter is more nearly completed. It was commenced in December, 1898, and so far as tunnelling is concerned it is now practically finished. Some time this month the contract for the electrical equipment of the line will be signed, and it is confidently hoped that passenger traffic will be possible next June. The new line will be about 3½ miles long. It is connected with the Great Northern main line at Finsbury Park. The City terminus is opposite the Moorgate Street station of the City and South London. There will be five stations, those in Old Street, Essex Road and Drayton Park, and the two termini. The two tubes vary in depth from between 60ft. to 90ft., the railway in the vicinity of the Essex Road station being the deepest part. It may be added that the tunnels are exceptionally broad, and will permit the passage of the ordinary Great Northern rolling stock. To prevent or minimise vibration, the lower half of the tunnels is built of concrete and brick, while the upper portion has a "roof" of iron.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Regilding Baths.

WITCHAMPTON.—E. T. writes: "I am about to re-enamel and regild some baths for a nobleman's house. I find that leaf-gold put on to the usual gold size will not stand hot water. Can you suggest something?"

Use japanners' gold size and gold leaf.

W. J. P.

Nuisance Caused by Surface Water.

CREDITON.—J. E. B. writes: "About twenty-five years ago A. rented a garden, the entrance to which was through a private roadway between two houses. This road was divided in the centre by a board partition about 6ft. high. About twenty-three years ago A. raised the ground on one side of the partition in order to enable him to take in his horse and trap. Some years ago the partition fell down and was replaced by an iron railing. One-half of the road now being lower than the other, A. received notice to give up his garden. After being out of possession about eighteen months, he received notice from B., the adjoining owner, to abate a nuisance caused by water from the garden getting into B.'s property. Is A. liable? B. bought his property many years after A. had raised the road."

A. is not liable. B. came to the nuisance, buying his property after A. had raised the road, and thus accepting the condition of affairs then existing. G. A. T. M.

Erecting a Shed.

LONDON, S.E.—A. E. B. writes: "At the side of my house there is a piece of land 13ft. by 26ft., obviously kept back for the line of frontage. It is enclosed by a 9in. brick boundary wall 7ft. high. I wish to erect a wooden shed to the height of the wall. Shall I have to obtain special permission?"

Permission to erect the proposed shed must be specially obtained from the County Council, but it is very doubtful if it would be granted for a wooden structure. On the other hand, if it could be so planned as to be a bay window and its total projection limited to 3ft., it could be erected without special permission. G. A. T. M.

Re-drawing Sheet for R.I.B.A. Intermediate Examination.

KETTERING.—LEIGH writes: "In the testimonies of study for the above examination I have done one of my sheets, Fireproof Flooring (particulars taken from an old Kalendar), in isometric projection and to a scale of 1½in. to the ft., but I find on procuring last year's Kalendar that it is altered, and that ½in. to the ft. is the scale given, with no isometric projection. Will it be necessary for me to redraw that sheet, as it is coloured and complete?"

The sheet need not be redrawn, but a letter of explanation should accompany it. G. A. T. M.

Drawing Papers.

WHITFIELD.—MANCUNIAN writes: "In preparing the R.I.B.A. testimonies of study what kind of paper would you recommend, hot-pressed or ordinary? Kindly state for what purpose each is prepared."

Hot-pressed drawing paper is that which has been rolled between heated rollers in order to give it a smooth surface. It is most suitable for pen or fine pencil work; but when the paper is damped with wash or for the purpose of stretching it on the drawing board the smooth surface is generally removed in part, returning somewhat to its first state. The ordinary surface is the only really safe one to use for colour- or wash-work. We should advise you to use both kinds of paper, each where it is best.

Price-Book for the North of England.

MANCHESTER.—F. S. writes: "I have heard it said that Laxton's price-book is far too high for the North of England. If this is so please name a suitable price-book for the North."

We know of no price-book that is suitable for the North of England, nor do we believe there is one. The ordinary price-books are only useful for pricing trade specialities, and then discounts, sometimes as much as 75 per cent., need to be allowed for; but the prices for ordinary every-day materials and goods must necessarily be of little or no use in different localities, and even then the prices for imported and manufactured goods fluctuate from week to week. We can only advise you to obtain quotations from several sources in the district, or ask some estimating clerk or builder who knows the local circumstances well.

Scientific Masonry.

LEICESTER.—CHISEL writes: "Kindly name a good book on masonry and stone-cutting. I want a book that will be of assistance in the preparation of detail drawings, particularly in the construction of domes and vaulting, showing the best method of projecting and determining the sizes of the stones."

Scientific masonry is founded upon the universal principles of mechanics, physics and chemistry, and we know of no book adequately dealing with the elements of the science. To properly design stonework one needs to be acquainted with the three branches of science we have named, and also to have practical acquaintance with the working of stone in order to know the economical and logical treatment of the various kinds. Of course stone was worked in the past (and to a small extent at the present time) by practical men without theoretical knowledge, proportioning the stone by experiment to suit the requirements of each particular case, and not by general rules found from comparatively few experiments. For this rule-of-thumb method to be used to perfection the craft must hand the knowledge down from man to man traditionally. But, for good or ill, the traditions of building have gone for the nonce, and we must now use scientific methods. The disadvantage of relying upon scientific rules alone is apparent, however, when we consider that much Gothic masonry judged by modern engineers' formulæ would be unstable, although it is clearly right, for Gothic constructions have stood for many centuries. The reason of this is that engineers, and architects for that matter, specify sizes by formula, using a factor of safety to cover the variation in quality of the same material and to allow for small flaws, &c., whereas a practical man would carefully pick out and choose the material according to his several requirements and vary his proportions to suit his material, thus avoiding wasteful use and obtaining a true proportioning. We would advise our correspondent if possible to leave the detail of his masonry to a craftsman who has made a scientific study of it. If this is not possible the following books will be found of some use: "A Treatise on Masonry Construction," by Ira O. Baker (21s. nett); "Modern Stonecutting and Masonry, with special reference to the making of working drawings," by John S. Siebert and F. C. Biggin (6s. 6d. nett), and "The Rudiments of Masonry and Stonecutting," by Edward Dobson (2s. 6d.). The latter deals with the principles of masonic projection and their application to the construction of curved wing walls, domes, oblique bridges and Roman and Gothic vaulting. For the principles of applied mechanics "Rankine's Manual" (12s. 6d.) is the standard work, but for the study of this subject a knowledge of higher mathematics must be possessed. These books can be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C. Five articles on "The Construction of Five Famous Domes," by John A. Marshall, appeared in Vols. VI. and VII. of the BUILDERS' JOURNAL, and a reply to an enquiry on stresses in domes by the same writer will be found on page 439 of our issue for January 9th last. H. K. D.

Fungus Growth on House.

NORTH WALES.—PENSARN writes: "Can you state how to destroy and prevent a fungus growth on the cemented surface of a house near the sea-coast? The house in question is situate at the end of a terrace built about thirty years ago by various owners and builders, and is the only one so affected, and whilst the surface appears sound and hard this growth exudes in disfiguring patches of a dark-brown colour. Some attempts have been made to remove the disfigurement by washing with carbolic acid and colouring, but the fungus throws off the colour and reasserts itself. The aspect is north, west and south, the north side being most affected. Sea-sand has no doubt been used in mixing the cement."

I fear this is one of those unfortunate cases where "prevention is better than cure," and that nothing short of stripping and re-cementing the wall will be of any permanent benefit. Painting or colouring the spots will be of no use whatever, as nothing save the total eradication of all the spores will stop a fungoid growth when once established. The only suggestion I can make is that the fungus should be removed at frequent intervals, thus minimising the disfigurement. I presume it would give the house a strange appearance were the walls all coloured brown to match the fungus.

G. S. M.

Footings.

LONDON, W.—FOOTINGS writes: "Wishing to build close up to the boundary line of a site adjoining the garden of another property, and separated from it by a wooden fence, and the building by-laws of the district (not the London Building Act) requiring footings on both sides of the wall—(*a*) have I a legal right to dig into and place the footings of my wall on the adjoining owners' land? If not, (*b*) what is the custom in such cases?"

You have no legal right to place the footings of your wall on the adjoining owner's land, but under ordinary circumstances the adjoining owner frequently allows the footings to project upon his land. This, however, is purely a matter of arrangement. T. E. C.

Building Patents.

ROADE.—A. S. writes: "Where do I need to apply, and what steps have I to take, in order to obtain a patent for a small article for the building trade?"

Apply to the Comptroller-General of the Patent Office, 25, Southampton Buildings, Chancery Lane, W.C., for the necessary forms. You can either obtain provisional protection or letters patent for your invention. The stamp duties are respectively £1 to £4. Provisional protection is valid for nine months, letters patent for fourteen years, the latter however requiring a yearly fee to be paid in order to maintain the patent. We might refer you to the articles on patents which appeared in our issues for November 15th, 1899, and March 14th, 1900.

Registration of Architects.

DERBY.—X. Y. Z. writes: "I entered into partnership eighteen months ago after having served a three years' pupilage. How should I be affected by the passing of the Bill for registering architects?"

MANCHESTER.—B. B. F. writes: "I served my 'time' with a provincial architect, who agreed to take me without a premium. There was no agreement or indenture prepared. I stayed with him 3½ years and have since been almost four years an assistant in a good office here. If the Bill passes, shall I be at a disadvantage, having no written evidence of having been in the profession almost 7½ years?"

The object of these "Enquiries Answered" is to supply information which will be useful to readers, and, though the questions be legion, we always endeavour to render as much help as possible. In former issues we have devoted considerable space to the suggested registration of architects, and on several occasions we have replied to specific questions affecting the Bill. As there are at present no indications of the Bill becoming law, it seems to us useless to continue to answer various questions which might arise *when* the measure was passed. Even assuming that it had been entertained by Parliament, changes might be made in its provisions which might entirely upset any replies given on the Bill in its present state, and as questions might be raised *ad nauseam* we consider it simply a waste of time and space to continue to publish replies to them.

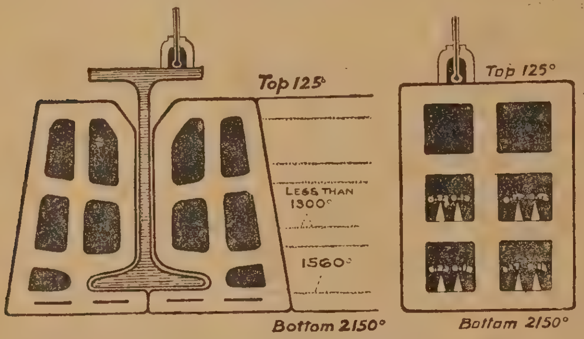
RATIONAL METHODS OF FIREPROOFING.

By W. C. FURBER.

THE experiments of James E. Howard indicate that steel has its maximum strength at about 400 degs. Fahr. Howard's experiments show that the strength is affected also by hardness of the steel, the hard steel having a higher resistance than the soft steel; thus he found that 10 per cent. carbon steel had a strength of 20,000lb. per sq. in. at 1,000 degs. Fahr., and ·60 to 1·00 per cent. carbon steel had the same strength at 1,600 degs. Fahr. These facts teach us that in order to preserve the integrity of the structure the temperature of the framework should not be allowed to greatly exceed 400 degs. Fahr.

Fireclay is a native combination of the hydrated silicates of alumina, mechanically mixed with silica and alumina in various subdivisions, and sufficiently free from the silicates of the alkalies and from iron and lime to resist vitrification at high temperatures. According to the authorities, fireclay contains from 47 to 80 per cent. silica and from 17 to 48 per cent. alumina. Fireclay is probably the most durable substance that can be applied to the protection of ironwork from heat. The knowledge, however, of its virtues has frequently led architects and manufacturers to decrease the thickness of the covering of the ironwork to a point where it no longer answers its purpose in a satisfactory manner.

Since the substitution of ironwork for brickwork in the structural parts of a building, the tendency has been to restrict the space occupied to the minimum, and this has resulted in begrudging every inch required for fireproof covering, and as a consequence in such cases the fireproofing is no longer of sufficient thickness to fully insure that the ironwork will be properly protected in the event of great heat.



EXPERIMENTS TO DETERMINE THE TRANSMITTING POWER OF HEAT THROUGH HOLLOW TILES.

The skeleton building has reduced the area of piers and columns to such a small part of the area formerly required that the other extreme has been reached in making the sections of the minimum dimensions, with the least possible allowance for thickness of fireproof covering, and as a result of this at least some of the so-called fireproofing is a mere pretence; for while it is true that the covering is fireproof in the sense that it is non-combustible and almost indestructible itself under trying conditions, yet it is not thick enough to afford insulation to the metal within it, to preserve it; and the term "fireproof" has become, therefore, a misnomer. In those instances where buildings have been subjected to severe tests and failure has resulted the unthinking critic has condemned the system of fireproofing, whereas the method only was at fault.

The necessity for dead air space cells makes it more difficult to insulate the structural work by preventing any considerable conduction of heat from the point of application. A glass lamp chimney is kept below the melting point of glass because the heat of the flame is rapidly carried away by the upward current of air and by radiation, while if the heat were stored in it it would soon reach its melting point. The column and beam, not being able to give up their heat by conduction and radiation, store it up, and are therefore placed in an unfavourable position compared with the lamp chimney. The dead air space cells, however, play a very important part in fireproofing, and are highly effective in the non-conduction of heat. Some authorities give the thermal conductivity of air as $\frac{1}{3500}$ part of that of iron; the data relating to these matters, however, is not complete, nor is that which is in existence in a very satisfactory state. The value of dead air spaces, however, is very great, and the use of air-cells in terra-cotta fireproofing is essential. Fireclay with air-cells has many times the value of the solid material; it is evident, therefore, why they should be used in fireproof coverings.

The value of air-cells as a non-conductor of heat is shown very clearly in the accompanying illustrations, and will bear study by designers and manufacturers. Volumes might be written as to the behaviour of fireproofing under tests, but these illustrations contain more practical information than pages of general description of how a particular accident occurred, and why one place failed when another did not.

These experiments show that after a test of twenty-five hours, with a final temperature of 2,150 degs. on the outside of the floor tile, a temperature of 1,560 degs. was found in the first cell adjoining the outside 1in. of terra-cotta wall, and while twenty-five hours is a very severe test (for if time enough be given the whole mass would attain the same temperature) yet the reduction of heat is not sufficient to have maintained the full strength of the beam even for a short time.

The temperature in the first air-cell is 1,560 degs. Fahr. If this temperature is obtained here, it is evident that the lower flange of the I-beam, which has not as much protection, is considerably hotter, and as the temperature of the iron should not be allowed to greatly exceed 400 degs. it is apparent that this beam has lost a great part of its strength temporarily. The second cell shows a very much greater reduction in the temperature, and the top of the block shows a comparatively low temperature. The great capacity of the iron to absorb and transmit heat is shown in the temperature of the top flange of the beam, which is much higher than that of the terra-cotta. While this experiment was evidently made without scientific precision, yet it answers the purpose in an admirable way as illustrating the progress heat makes in going through the floor.

The cellular construction used in the body of the ordinary floor tile is wholly omitted about the flanges, and this is shown to be a mistake. The reason it is omitted is because it would make the floor thicker than usual, and this means that the building must be made higher, because the floor thickness would be increased.

The protection the beam should have is, of course, determined by the maximum temperature to which it is likely to be exposed, but in conflagrations temperatures of 2,500 degs. Fahr. are easily obtained.

S. Albert Reed estimated that the temperature of a fire at a lard refinery at 59th Street and Eleventh Avenue, New York, was 5,000 degs. In the tests made by the committee of Fire Insurance Underwriters the Architectural League, and the American Society of Mechanical Engineers in 1896, the committee decided to make tests on the following basis: 2,500 degs. for six hours, representing a conflagration; 1,200 degs. for one hour, representing a mild external fire; 700 degs. for one half-hour, representing a mild condition such as might occur in an office building or dwelling.

The building, to be effectually fireproof, should be capable of resisting the probable maximum temperature, and assuming that to be 2,500 degs. the ordinary covering is not sufficient. It is quite possible to cover metalwork in buildings so that the application of great heat for a short time shall not injure it, but in order to ensure this the covering must be thick enough.

The firebrick lining of steel-melting furnaces is about 12½in. thick; the temperature of melting steel is about 2,900 degs., or 12½in. of firebrick is required to insulate 2,900 degs. of heat. This thickness of lining insures that the hot steel shall not be chilled from the outer air, and also that the iron covering of a Bessemer converter shall not be reduced enough in strength to prevent it answering as a constructional envelope. This practical example gives us some basis for arriving at the thickness of covering necessary to protect the structural parts of a building.

The conditions of exposure, however, are greatly in favour of the steel converter or the open hearth furnace in this respect, that in these instances the heat is conducted or radiated away from the outer walls into large volumes of air of ordinary temperature, which keeps their surfaces at a temperature corresponding to the capacity of the surrounding air to absorb it; while with a beam or column in a building little or no opportunity can be afforded to conduct the heat away because the air spaces must be "dead"—that is, they must not be continuous in order that under no conditions they could act as flues to conduct heat and fire along their length and thereby defeat their purpose as a protective covering.

In buildings a covering of 1in. of porous terra-cotta is all that protects the lower flanges of the I-beam; the girders usually have a trifle more or a total thickness of 1½in. to 2in. covering.

The experiments of Howard and others show that steelwork to preserve its integrity should not be allowed to attain a temperature exeeeding 400 degrees; 1in. to 2in. of terra-cotta cannot prevent this. It is probably true that manufacturers are not wholly responsible for the thinness of their covering, but are compelled to follow the footsteps of the original designers, because architects have been accustomed to the previous shapes and forms and will not make any changes in the direction of increased thickness, and if this is true the responsibility for the present insufficient methods must rest upon the architect's shoulders. Manufacturers cannot be expected to make things they cannot sell, and if the thin coverings are the only kind they can dispose of then they are in a commercial sense blameless; nevertheless, a moral responsibility rests upon them to prove to their patrons the necessity for a greater thickness of covering to ensure the result striven for.—From the "Brickbuilder" (Boston, U.S.A.).

Masters and Men.

Swansea Strike Ended.—After a strike of more than fifteen weeks the Swansea builders' labourers have agreed to return to work on the old scale of wages, by which they receive 5½d. per hour and scaffolders 6d. The skilled-labour element, tired of the struggle, had practically seceded from the federated trades and weakened the men in their demands.

The Royal Botanic Society's Garden in Regent's Park has been secured to that body for a further term of thirty-one years by lease granted by the Department of Woods and Forests. New club-rooms are to be built and a garden school formed.

One Contractor or Several.—At the last meeting of the Leeds City Council the question of letting the contract for the Seacroft Hospital Extensions, which involve an expenditure of nearly £200,000, came up for consideration. The chairman of the sanitary committee proposed that the work be let to one contractor, and that clauses be inserted in the conditions of contract providing for the letting by such contractor of various trades to master tradesmen to be approved by the committee and protecting such tradesmen as to payment for work done. An amendment to refer the matter back with a view to the contract being split up was carried. The sanitary committee further considered the matter, when a letter was read from Mr. Hall, the architect, stating that the proposed alteration would entail considerable delay. The committee, however, decided to instruct him to prepare quantities in separate trades in accordance with the decision of the council, but the chairman states that this will not preclude anyone tendering for the work as a whole. When the extensions at Seacroft have been completed the sanitary committee will next have to consider the erection of a small-pox hospital at Killingbeck, which is calculated to cost £66,000.

Bricks and Mortar.

APHORISM FOR THE WEEK.

You have had your education at Westminster; and doubtless among those dim aisles and cloisters you have gathered much of that devotional feeling in those young years, on which your purest mind feeds still—and may it feed! The antiquarian spirit, strong in you and gracefully blending ever with the religious, may have been sown in you among those wrecks of splendid mortality.—CHARLES LAMB.

Our Plates.

THE two examples of Italian tabernacles—both of which are Florentine work—belong to the latter part of the "early" period of the Italian Renaissance. They exhibit a great variety and richness of carved detail executed with the characteristic skill and taste of the "sculptor-architects." The larger of the two, from the church of San Girolamo at Fiesole, is of alabaster, 5ft. 7in. by 2ft. 5in. in extreme dimensions. It was purchased by the South Kensington Museum authorities for £450. The tympanum of the pediment contains the Child figure with right hand raised in the ecclesiastical process of benediction; the Dove enveloped in flame-like rays—presumably emblematic of the Holy Spirit—appears immediately over the engraved copper door, and the carved eagle at the base is the symbol of St. John the Evangelist. The use of the "tabernacle" in Catholic ritual, viz., to contain the sacred elements reserved from the Sacrament, will be generally known, and it holds a position over the altar. The smaller example is in many respects similar; the Dove occupies the tympanum, and the flame rays occur at the junction of the curtains (carved) to the sides of the door. The stone is a fine granite grey limestone. The two drawings are by Mr. Frederick R. Hiorns, A.R.I.B.A.

A Short History of the Salon.

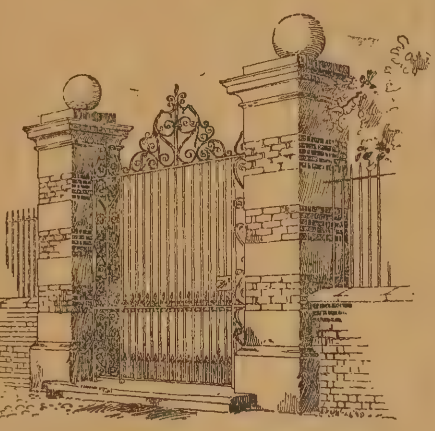
IN the August number of "Lectures pour Tous" there is an interesting article about the pictures and sculpture rejected by the Salon during last century. The Salon, it begins, was founded in the seventeenth century, and has been held at intervals ever since. Previous to its inauguration artists were obliged to exhibit their works in the open air. It has been installed in several places—in the Louvre, Palais Royal, Orangerie des Tuileries, Palais de l'Industrie, Champ de Mars, and finally in the magnificent Grand Palais des Champs Elysées. Up to 1830 the professors at the Academy decided that students should represent only one human type. For example, the brow and nose should join in a straight line. There should be a certain distance between the mouth and the chin, the eye and the ear, &c. Antiquity had left models of harmonious movement. Consequently the artist was not allowed to put too much action in a figure, nor was he permitted to express too much passion in the face. Each object represented had to be painted a certain colour in keeping with tradition. In short, the ideal was that of ancient statuary, good enough in itself but misplaced when followed in modern painting. At this time, however, a band of young artists, inspired by the success of the Romantics in literature, began to break away from academic convention. Life, passion and movement were the characteristics of the innovators. Delacroix painted scenes from "Hamlet" and "Lear," Rousseau went to the Alps and depicted them in their grandeur, and Barye chiselled groups of animals full of vitality. In 1836 the new school sent its works to the Salon, and their success or failure would mark a renaissance or a decadence. The moment was decisive for French art. But the jury, composed of members of the Institute, held up their hands in horror and rejected the whole lot. A scandal ensued. The young artists appealed to the public. The Duc d'Orleans and the king himself were dragged into the squabble. The Classics cried to the Romanticists: "Vous êtes des sauvages ivre," and they in turn replied, "Vous êtes des assassins." In 1837 the "Avenue des Châtaigniers," by Rousseau, was rejected, and the artist had great difficulty in disposing of it for 2,000fr.; ultimately Durand-Ruel purchased the picture for 27,000fr. In 1842 Corot's "Baptême du Christ" was refused.

Romanticists and Realists.

THE Revolution of 1848 brought about the downfall of the old jury of painting. Napoleon introduced a new jury composed of members of the Institute and art critics favourable to the new movement, and gradually the Romanticists assumed full sway at the Salon, they in their turn shutting its doors to the Realists, who began boldly clamouring for admittance. In 1859 Millett sent his "La Mort et le Bucheron." The members only saw brutality, and they refused it. In 1863 the works of the Realists were rejected *en bloc*, and so great was the indignation that the Emperor ordered all the works of art refused to be exhibited in a part of the Palais de l'Industrie, so that the public should decide between the jury and its victims, and the success of the show was so conclusive that a considerable reform was made in the composition of the jury. Henceforward three-fourths were to be elected by painters, the remaining number to be chosen by the Government. Then came the "Impressionists," with Manet at their head, and like their predecessors they were stopped outside the gate. After a long struggle the independents triumphed, and for the past twenty years the exhibitors themselves have chosen by ballot the members of the jury.

Protection of the National Gallery.

THE Select Committee to whom the National Gallery Purchase of Land Bill was referred have agreed to a special report, in which they state they are strongly impressed with the importance of the acquisition by the Government as soon as possible of other lands adjoining those obtained under the Bill, in order that the National Gallery may be more effectively protected. It appears that the only additional land that can be of any use consists of the sites of the half-dozen business premises in Pall Mall East between the western end of the Gallery and Whitcomb Street. It was in one of these premises that a fire broke out last year, and but for its being promptly extinguished it is certain the National Gallery, which is in anuglar contact with the building, would have suffered. The land already scheduled for the Gallery is the courtyard of St. George's Barracks and the site of the buildings themselves. These lie on the immediate west of the Portrait Gallery, and have frontages to the north on Orange Street and to the west on St. Martin's Street. Portions of the barracks that abut on this last-named thoroughfare have already been demolished, but the hopes originally held out by the Treasury that the whole site would be cleared before the close of the present year are not likely to be realised. With the barracks removed the Gallery will stand isolated without any danger from fire save for the menacing business premises in Pall Mall East.



GATE IN THE CATHEDRAL CLOSE, SALISBURY.
DRAWN BY H. T. REES.

Praise, for a Change.

SPEAKING of the students' work in the national competition at South Kensington, of which a criticism appeared in our issue for August 7th, an art critic in the London "Echo" says: "As a nation of shopkeepers we can rejoice that there is a distinct advance in the quality of the purely decorative work, and especially in the matter of mural enrichment, jewellery and metalwork design. Each year discovers an increasing vigour in these branches. Our cretonnes, our carpets, our wallpaper, and our metalwork in the near future stand an excellent chance of becoming things of real beauty. These designs are works of art, and they are within the limit of the cheapest manufacturer, who in turn brings them within the range of all classes. Our wonder on looking at the really delightful effects obtained by stencilling upon canvas is that greater use is not made of this method of wall-covering."

Proposed City Square for Hull.

THE Corporation Property and Finance Committees of the Hull Corporation recently accepted the scheme of Mr. Hirst, the city architect, to form a great City Square in the heart of Hull. The city architect reported that in accordance with instructions he had interviewed the present tenants of the shops in the Corporation property in Waterworks Street, Junction Street, St. John Street and Chariot Street, and had submitted to them plans showing accommodation sufficient for those who expressly desired to take shops after the rebuilding. He proposed to take down the whole of the present old shops and buildings, to provide a large open square near the Monument and to erect thirty-four shops of varying frontages, some with ground floor and basement only and others with four floors. The scheme included also the provision of a public hall with retiring-rooms, together with three large reception halls. These halls would be on the first floor with a main entrance from the proposed square. There would also be eight subsidiary entrances and exits in Waterworks Street and St. John Street. The great hall would have side and rear galleries and an orchestra, and would accommodate 3,000 persons. The three smaller halls might be used either with or without the great hall. The buildings could be carried out in two portions, commencing at the proposed square, provision being made during reconstruction for the older tenants, and when the buildings were finally completed the option of position could be given to such older tenants. The proposed square measures 272ft. from north to south and 216ft. from east to west (from building to building). The area proposed to be added to the existing streets is about 1,600 sq. yds., thus forming an open square in the heart of the city a little over an acre in extent. The approximate estimate for erecting the buildings, including the purchase of necessary land to complete the block, is £92,000. The estimated rentals from the new shops (including two licensed houses to be rebuilt, one of which could be used in connection with the public hall) was £6,836; from public hall, £1,014; increase of rates on shops, £632, making a total nett revenue of £8,247. The present nett rental of the property is £4,375, leaving a balance of £3,872. The Corporation do not get possession of the property until February of next year. As soon as the existing tenancies fall in building operations will be commenced.

Restoration at St. David's.

THE restoration of the lady chapel of St. David's Cathedral, which has just been completed, includes a groined ceiling of Doulton stone. The style adopted is the same as in the original—moulded ribs, started off the original old springers, there being the usual number of bosses and shields, on which are carved the arms of the bishops and deans. The outside roofing is of cast lead surrounded by a stone parapet. At the east end is a niche in which has been placed a statue of the Virgin and Child. This is also of Doulton stone. The pinnacle on each corner has also been restored. The flooring is of fine Portland stone and encaustic glazed tiles in squares. The ancient monument on the south wall of Bishop Martin has also been restored. The ante-chapel situated between the Bishop Vaughan chapel and the lady chapel, though seemingly detached from the cathedral, yet is not so. The ceiling and flooring have been renovated and restored where necessary. This present restoration has been carried out by Mr. William Thomas, Haverfordwest, contractor, under the superintendence of Mr. James Thomas, of the same place, the architect being Mr. Scott, son of the late Sir Gilbert Scott.

RANGE BOILERS.*

BY THOMAS POTTERTON.

BOILER power is a very important item and should always, with as small a consumption of fuel as possible, be well able to give the hot water required in a reasonable time, say thirty minutes after lighting the fire.

Fig. 1 is a section of a range with the ordinary arch flue bath boiler; Fig. 2 is the boiler out of the range. This allows an enormous waste of heat, exposes very little surface to the action of the fire, and for the amount of fuel consumed gives the least effective results of any water-back range boiler. If fitted to a range with a fire 12in. wide, 12in. high and 9in. deep, the boiler should be 16in. wide, 10in. high, 9in. back to front, the arch flues being generally 5in. or 6in. wide by 4in. high. This boiler would have about 1¾ft. of heating surface. My experience is that a hot-water cylinder of 25 to 30 gals. is quite large enough for this class of boiler, with one bath and two other draw-offs.

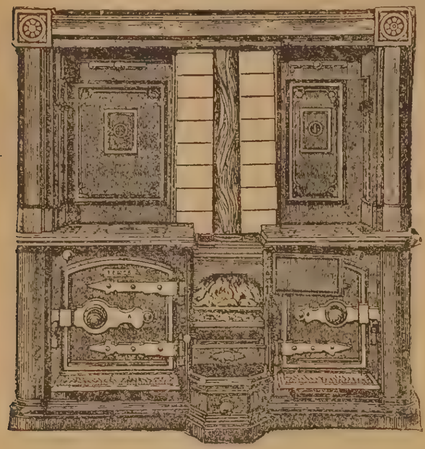


FIG. 1.

Fig. 3 is the ordinary boot boiler, of which a large number are used. It is a small improvement upon the boiler shown by Fig. 2, and when fitted to a range fire of the same size as the one last mentioned it will, if properly set, expose about 4ft. of surface to the action of the fire. I consider a reservoir of 45 gals. is suitable for a boiler of this type and size, which would supply one bath and three draw-offs.

Fig. 4 is an improvement upon Fig. 3, having a tubular flue. It has about 6ft. of heating surface, and under the conditions before mentioned would supply a reservoir of 60 gals., with two baths and four draw-offs.

Fig. 5 is a range boiler (in two sections) specially constructed to avoid the usual waste of heat which escapes into the chimney, as occurs with the boilers in Figs. 2, 3 and 4.

Fig. 6 shows this boiler fitted to a range, the soot doors being lifted off to expose the flue, which it will be seen is very easy to clean, much more so than the ordinary back boiler flue. This is a most powerful range boiler and, as will be seen, the flames pass between the waterways, a large area of which is horizontal heating surface, the most effective that can be had.

The boiler has about 17ft. of heating surface with the leg 15in. deep, and a reservoir of 120 gals. would not be too large if fixed under similar conditions to the others. I have fixed them with 180-gal. cylinders with satisfactory results. It will be noticed that I have given the boilers similar conditions as to fireboxes, &c.

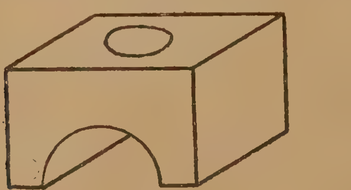

FIG. 2.

From what has been said it will be seen that the smallest boiler has about 2ft. of heating surface or less and the largest about 17ft. From the smallest boiler you would get about 25 gals. of boiling water two hours after lighting the fire; but from two tests, one tried by myself in London and another carried out by an engineer in Manchester, 120 gals. of water were heated to boiling-point by a zig-zag boiler two hours after lighting the fire: so that I have no hesitation in saying that, by consuming the same amount of fuel, boiler Fig. 5 will give five times the result of boiler Fig. 2, and is sufficient to supply four baths and eight to ten draw-offs.

In many instances boiler Fig. 5 will, if required, make a large quantity of hot water in excess of the domestic wants, and its surplus can be used to heat or supplement the warmth of halls, staircases, billiard or other rooms.

Fig. 7 shows an apparatus installed in a house near the Crystal Palace. In this case the existing domestic supply was not altered except for two things. Firstly, a combination towel drier of 20ft. heating surface was fixed in the bathroom to the return from the hot-water tank (which was also fixed in the bathroom); and secondly, the cold-water down-pipe was disconnected from the bottom of the hot-water tank and carried down to join the return pipe near the boiler. As well as in the bathroom, warmth was required on the first-floor landing B, hall ground-floor C, bedroom first-floor D, drawing-room E, and in the billiard-room F. Four radiators of 30ft. heating surface and one of 60ft. were installed. The old range and boiler were taken out, and part of the old apparatus, flow and return pipes to point A, were cleared away. A new range and boiler (Fig. 5) were then fixed, the new part of the apparatus being piped as follows: A 2in. pipe is carried from the top of boiler along near the ceiling to the point A (which is the highest point in this main) where the flow and return pipe to the existing apparatus (tank in bathroom and new towel drier) are connected off and on as shown. From the point A the 2in. main is run with fall out and back to the boiler, making a circuit as near as possible under the different radiators. From this main 1in. connections are made on the one-pipe system to the radiators of 30ft. heating surface, a 1¼in. pipe being carried to the radiator F in the billiard-room, the return from which joins the 2in. return pipe near the boiler. The apparatus is arranged so that the 2in. pipe is always in circulation, and should air accumulate in the radiators the main will properly fill, always circulate, and supply hot water for domestic use. All air collecting in the 2in. main will pass out at the expansion pipe. Each radiator is fitted with a stop valve, and the whole of the heating apparatus can be shut off. The pipes in the basement are covered with sectional pipe-covering consisting of hair-felt ½in. thick and strawboard exterior. This pipe-covering, bulk for bulk, is the best heat non-conductor I have tried. I have it fixed side by side with the best asbestos obtainable. It is easily fixed and makes a neat finish. The radiating surface of the heating apparatus amounts to 200ft. in all. This apparatus was fixed several years ago and has proved quite satisfactory.

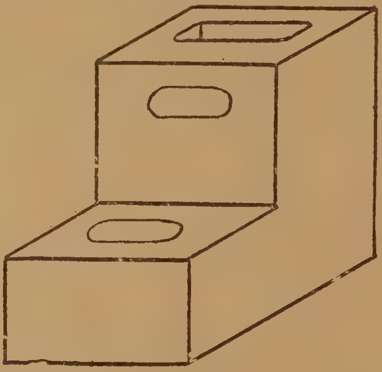

FIG. 4.

With reference to incrustation in installations of this kind, I might mention that during the past seven years I have fixed many of these boilers in different parts of England and Wales, and in no case have I heard of incrustation interfering with the working of them.

Last autumn my men took out a boiler of Fig. 5 type which had been in use six years in London in order to fix a more powerful one in its place for a larger installation. There was only a very small amount of lime in the boiler taken out, and none in the 2in. main.

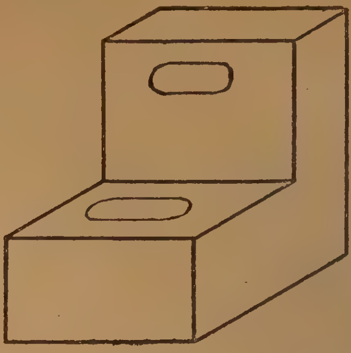

FIG. 3.

Fig. 8 is a diagram of a heating apparatus fixed in a new house in Devonshire, to work in conjunction with new domestic hot-water supply. The house will be seen to consist of ground and first floors only. The hot-water service supplies two baths, two lavatory basins and slop sink on first floor, scullery and butler's pantry sinks, and lavatory basin on ground floor. The hall and staircase are warmed by radiators, and the two bathrooms by combination towel driers, while radiators for supplementary heat are provided in the dining-room and in one bedroom. The range and boiler are of the same class as those previously described. A hot-water tank (capacity 80 gals.) is fixed near the scullery ceiling. A 2-in. primary flow is run from the boiler to the tank with a safety-valve fixed on it near the boiler. From the top of the tank an expansion pipe is carried, discharging above the roof. From the expansion pipe, directly above the tank, two branches (not shown on diagram) are carried, passing in different directions for hot-water services. These are run partly in between ceilings and floors, and circulate as near the draw-offs as practicable, returning to the hot-water tank, which it joins on the side near the top. (None of this is shown on the diagram.) All draw-offs have control or stop valves fixed as near as possible to them, so that new washers may be fixed to the taps without emptying the apparatus.

The heating mains are as follows: From one side near the bottom edge of the tank a 2in. main is carried passing up towards the ceiling, and branching right and left with one 1¼in. pipe and one 2in. pipe, as shown. This construction reserves the hottest water in the apparatus for domestic purposes, and there is always about 80 gals. of it available in the tank and circulation above it. These two mains make a circuit of the building to the different radiators, and return to the boiler under the ground floor. They act as the return from tank to boiler, always being in circulation. Part of the ground

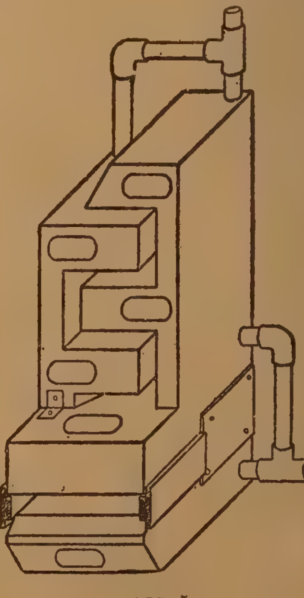

FIG. 5.

---

* A paper read before the Institution of Heating and Ventilating Engineers.

floor is of wood-block flooring, in which a channel is formed next the skirting for the pipes to pass in. The space is filled with slag-wool, and a board is screwed down over the channel so that the pipes are always accessible. The 2in. pipe to the right is carried along near the ceiling of the scullery and servants' hall, and is reduced to 1½in. after passing E. It passes down the wall in the angle and then under the floor to F, where it is increased to 2in., returning to the boiler through the channel referred to. It rises from the tank to J, which is the highest point in this circulating main and where a ¾in. air pipe is carried up above the roof, ensuring the apparatus working for domestic supply without any air valves. From J there is a fall to K. The 1¼in. pipe to the left is carried across the kitchen and housemaid's pantry, passing down the angle and returning to the boiler through the channel. This circulation rises from the tank to H and falls from that point to K.

Now as to the radiation. Radiator A is supplied for supplementary heat in the best bedroom (of 4,000 cub. ft. space). It stands near the door and has 42ft. of heating surface. It is connected to the 1½in. main with 1¼in. pipe at the top and bottom one end. Radiator B is provided for supplementary heating in dining-room (of 4,000 cub. ft. space), and is similar to A in heating surface and connections. Radiators C and D are provided on ground floor for the hall and staircase. C has 35ft. of heating surface and stands near a garden entrance; it has 1¼in. connections, as shown. D contains 45ft. of heating surface and stands at the foot of the staircase; it has 1¼in. connections also. Towel driers G and H, each with 20ft. of heating surface, are provided in the bathrooms (of 1,000 cub. ft. space each). There is 200ft. of heating surface in the apparatus without the hot-water tank and domestic supply. The circulating mains are covered with sectional hair-felt covering. The hot-water tank is cased in wood and packed with slag-wool. The return to the boiler being used also for domestic supply, I have fitted the three radiators A, B and D with two union valves each. If this were not done the hot water would work up the return pipes in summer time. It was not necessary in the case of the radiator C, as the valve fixed at the bottom of the radiator entirely stops the circulation in this branch.

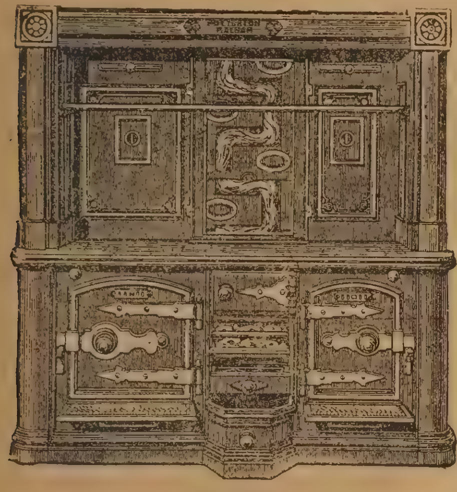

FIG. 6.

Fig. 9 is an apparatus fixed in a house at Wimbledon, and is much larger than the two previous ones. More hot water is required for domestic use and a larger heating apparatus is needed. The hot-water service supplies the scullery, vegetable cleaning and butler's pantry sinks in basement; lavatory basin on ground floor; two douche and spray baths, four lavatory basins, and housemaid's and slop sinks on first floor; one ordinary bath, one sink and one lavatory basin on the upper floor (15 points in all). Heat is required in the billiard-room, hall and three bathrooms, one having a linen closet. This apparatus is worked from two ranges fitted with ziz-zag boilers. One, in the kitchen, is a 60in. range with 12in. by 12in. by 12in. firebox, and the other, in the scullery, a 54in. range having a 12in. by 12in. by 9in. firebox. The cylinder-tank system is adopted. A 100-gallon cylinder is fixed in the scullery with flanges riveted on to receive the various connections. For the primary circulations 2in. flow and return pipes are run between the two boilers and the cylinder, the flows being connected near the top and the returns to the bottom of the cylinder. Between each boiler and the cylinder in both flow and return pipes fullway stop-valves are fixed. A safety valve (having a draw-off cock at the top) is fixed in each flow pipe and a draw-off cock in each return, both on the boiler side of the stop valves. This arrangement is to enable one boiler to be cleaned out while the other is in use. When emptying a boiler for cleaning purposes, its two stop valves are closed, and the draw-off tap on the top of the safety valve is opened. This enables the water to be drawn freely from the emptying cock. A 40-gallon tank is fixed in the cistern-room. For the secondary circulation 1½in. flow and return pipes are run between the cylinder and this tank. The flow is connected to the side of the tank near the bottom edge.

It will be noticed that the tank is fixed above the highest bath. The object of doing this was to obtain a full flow of water at the high taps, even though other taps below might be opened at the same time. This can only be effected by having a store of hot water above the highest taps. A 1¼in. expansion pipe is carried up from the tank. Branch circulations are carried from the secondary circulations, passing as near as possible to the different draw-offs, those to the douche and spray baths being 1¼in. Stop valves are fixed to all taps.

As regards the heating apparatus, four radiators, A, B, C, D, of 50ft. heating surface each, are fixed in the billiard-room. One radiator, E, of 50ft. heating surface, is fixed in the hall. Two combination towel driers, G and F, of 20ft. heating surface each, are fixed in the two bathrooms on the first floor. One combination towel drier, H, of 30ft. heating surface, is fixed in the top bathroom. Along the bottom of the linen closet in this room 75ft. run of 1in. pipe are carried. The total heating is thus:

Billiard-room	200 ft.
Hall	50 ft.
Two bathrooms on first floor.	40 ft.
Top bathroom	60 ft.
Total	350 ft. of heating surface.

The mains are as follows:—To heat the radiators in the billiard-room, A, B, C, D, a 2in. pipe is taken off the side of the cylinder about two-thirds down. This is carried beneath the billiard-room (along the basement ceiling), passing under the positions of the radiators. It then returns to the cylinder, joining it on the side, as shown. This main rises to the first connection of the radiator A, which is the highest point in this circulation. It then falls all the way to the cylinder. Two fullway stop valves and draw-off taps are fixed in this section for emptying if necessary. The radiators are connected on the one-pipe system. To heat the radiator E, in the hall, a 1¼in. pipe is run from the tank, passing into the top and out of the bottom of the radiator, returning under the

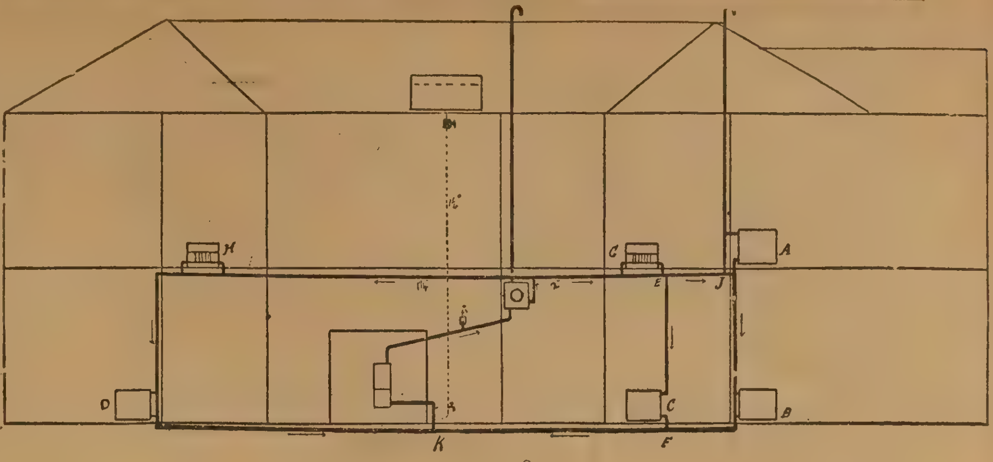

FIG. 8.

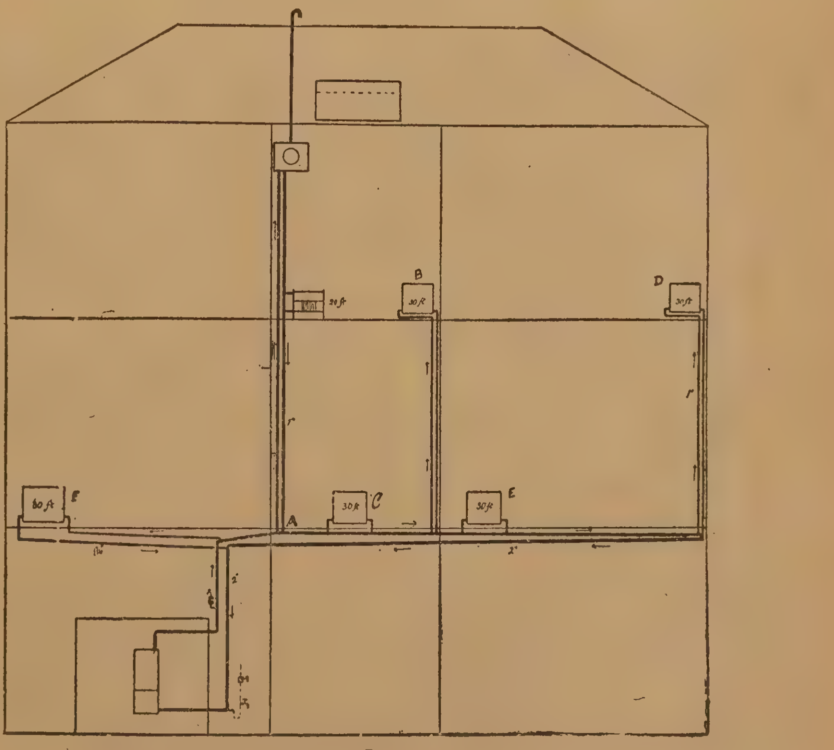

FIG. 7.

basement floor to the kitchen boiler. A stop valve is fixed in this return to shut off this branch when cleaning out the boiler. In this instance I have had to do what I would rather have avoided, that is, to connect the 1¼in. pipe which supplies the radiator E with the hot-water tank in the cistern-room. This, however, was the only course available. If the conditions had been favourable, I should have connected it with the cylinder in the basement, a little higher than the connections of the heating main to the billiard-room. I find that although the circulation of this branch is below the boiler and other parts of the apparatus, the results are most satisfactory, and the radiator in the hall heats well.

With respect to the hot-water supply to the towel driers, in this case I have also departed from my usual practice, having connected the combination towel driers to the circulations from which the hot-water supplies to the baths are drawn. It was permissible in this instance, as the circulations to the baths are in 1¼in. pipe. The towel driers have ¾in. connections, and the water after passing into the return pipe from them is hot enough for use. All radiators and towel driers are fitted with union angle valves.

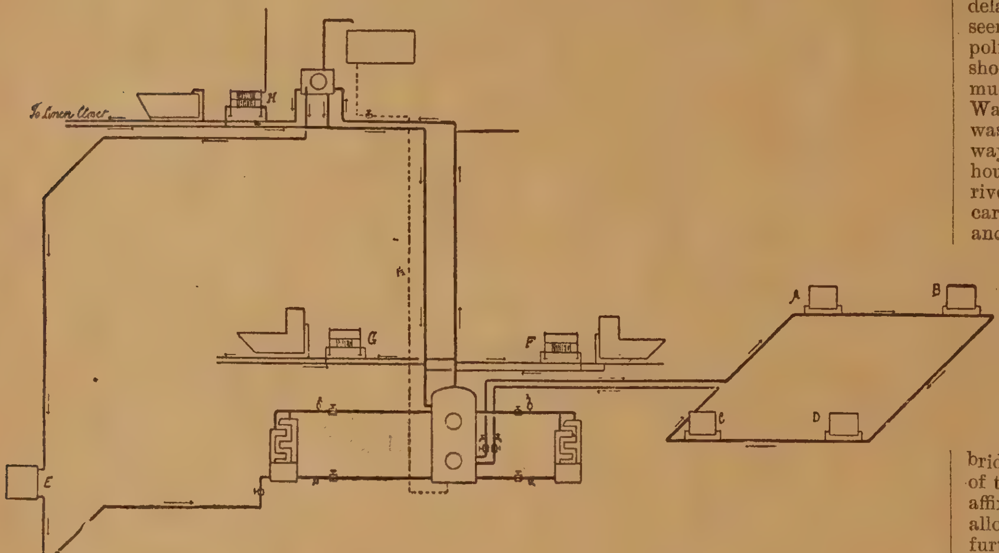

FIG. 9.

To prevent loss of heat and the overheating of scullery, the hot-water cylinder is covered in the following manner: Two layers of ½in. hair-felt are glued on the cylinder, and then bound round with wire. Over this is fixed a layer of silicate cotton sewn on strong canvas. The whole is covered with two layers of wire-netting, ½in. mesh, and then plastered all round and on top with a coating of plaster and Keene's cement, the whole being coloured to match the scullery walls. This was an expensive method, but most effective. The intensely hot water in the cylinder causes no inconvenience—in fact there is very little difference in the temperature of the outside of the cylinder and the walls of the room. The hot-water tank in the cistern-room in the roof is not protected. The warmth given off will prevent the cold service pipes freezing. Nearly the whole of the pipes to both the hot-water service and the heating apparatus are covered with sectional pipe-covering. One fire only is used in summer time, the damper to it being regulated to give little or much hot water as required.

In conclusion, it must be remembered that every apparatus varies to meet different requirements, and although the schemes described give every satisfaction the design of an apparatus must wholly depend upon particular circumstances.

On this account the designs given cannot in any way be considered as examples to be worked to; and while no doubt whatever need be entertained about the ability of the boiler to do the work stated, it is by practical judgment alone that success is obtained.

LIVERPOOL'S NEW TECHNICAL SCHOOL.

LIVERPOOL'S new technical school, designed by Mr. Edward W. Mountford, F.R.I.B.A., is now approaching completion. The building is an imposing addition to the pile which occupies one side of William Brown Street, and harmonises with the world-famous St. George's Hall. In the lofty vestibule columns of brilliant Devonshire marble rise from the tessellated floor, and around the circular dome are placed finely-executed panels by Mr. Pomeroy illustrating the rise of ship-building. Other symbolical sculpture tinted in various colours adorn the superstructure, and a spacious fireplace of marble, topped with a plastic representation of the city crest, adds to the attractive appearance of this vestibule. Of the five floors three are devoted to technical instruction under the directorship of Mr. Hewitt. The two floors above form the museum galleries. At the top of the building is a cross gallery devoted to chemistry, where fifty or sixty students may work, while above all is an observatory containing a large equatorial telescope. In the basement, which is really on the street level, are a large number of rooms and laboratories devoted to various branches of handicrafts. The engineering laboratory also finds a place in the basement, with testing machines and other fixtures, while woodwork, carpentering, joinery, &c., is also provided for.

The chief feature of the ground floor is the large lecture and examination hall. This is a lofty chamber with an oak floor and walls lined with white wood, and will afford accommodation for about 400 or 500 persons. One end of the hall is occupied by a platform, above which will be inserted a decorative panel by Mr. Pomeroy, whose sculptural work figures largely throughout the building. This floor contains a large number of classrooms, a physics lecture-room, and rooms especially well lighted for machine drawing. Building construction occupies also a portion of the first floor, upon which are a number of additional classrooms. Several special rooms in this part of the building are set apart for the work of the nautical college. Ventilation is by the "Plenum" system. At the rear of the building is a large courtyard containing boilers and other apparatus, by which filtered and warmed air is driven along a sub-basement and thence up the flues into the various chambers of the building. This system of ventilation, which is expected to prove entirely satisfactory, formed the chief object of inspection on the recent visit of a deputation from the Corporation of the City of London. The deputation were making enquiries into the matter for the purposes of the new Sessions House.

VAUXHALL BRIDGE.

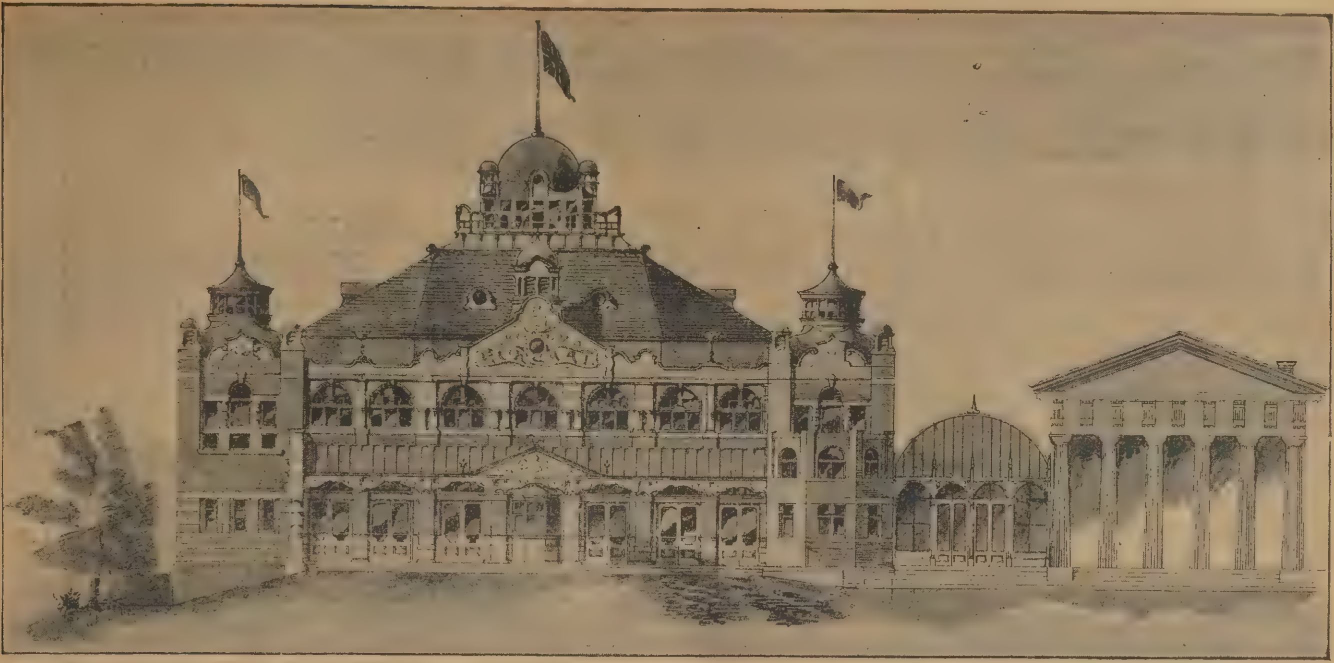
The Delay.

WHEN the new bridge over the Thames at Vauxhall is finished it will have cost probably £400,000, and have occupied an unconscionably long time in building. The bridge is one of the London County Council's undertakings, but the work is being done by contractors. The necessity for a new bridge at this point of the river became apparent shortly after 1879, in which year the bridge that had been begun in 1811 and finished in 1816 was opened free to the public by the Prince of Wales. These two dates are interesting, because they mark by contrast the extraordinary delay that has taken place over the erection of the new structure. In five years the old bridge was begun and finished. Three years have now elapsed since operations upon the substructure only of the new bridge were commenced, and an impartial examination of its present condition, taking into account also the rate of progress that has been made, indicates the lapse of another two years before the preliminary portion of the work is out of the contractors' hands. The history of the bridge at Vauxhall is interesting, but it cannot be said to throw any light on the present delay. As already stated, an investigation which seems to have taken place in 1879, when the Metropolitan Board of Works took over the bridge, showed that the foundations of the piers were in much the same dangerous condition as those of Waterloo Bridge at about the same time. This was due to the deepening of the bed of the waterway, the result of the great velocity—7½ miles an hour on the surface—which the ebb tide has in the river. Navigation was endangered, barges being carried against the piers, to their mutual injury, and lives were occasionally lost. In consequence of this state of affairs, Parliamentary powers were obtained in 1881 for increasing the width of the waterway beneath the bridge by the removal of two of the central piers and the underpinning and carrying down of the piers on either side to a greater depth.

But no sooner were these Parliamentary powers obtained than the question arose whether the complete reconstruction of the bridge would not be a more satisfactory method of treatment. The question was answered in the affirmative, and the Parliamentary powers were allowed to lapse. In 1887, however, there was further trouble with the bridge, and it was found necessary to protect the foundations of three or four of the deep-water piers. Subsequently the County Council decided to adopt the drastic course of entirely rebuilding the bridge, and in 1895 the Vauxhall Bridge Act, which authorised the rebuilding and the construction of a temporary bridge to accommodate the traffic during the removal, was obtained. This temporary structure which is now in use was opened in August, 1898, having cost £40,000.

The contract for the substructure of the new bridge was accepted in July, 1898, and the work was started shortly afterwards. The contractors were Messrs. Pethick Bros. of Plymouth, and their tender of £165,000 was accepted for the usual reason, that it was the lowest. The time allowed them expired, we understand, last March, but the work is still going on, and another two years would seem to be necessary for its completion. During these two years, and during the years that must elapse before the bridge is finished and opened, all the traffic, and it is very considerable, that crosses the Thames at Vauxhall is greatly inconvenienced, much of it having to make a detour of between 800 and 900 yards.

The Tunnel under the Quirinal Hill, Rome.—A tunnel has been bored under the Quirinal Hill connecting by a level passage for tramcars older and newer Rome. The summit of the hill in covered by the King's palace and gardens, and the excavations below have seriously damaged the royal grounds. The soil is subsiding to as alarming degree, snapping water pipes and uprooting trees. It has been found that a great part of the hill was honeycombed by the constructions of the ancient Romans—a fact which the modern engineers of the tunnel had evidently overlooked.



THE NEW KURSAAL FOR HARROGATE. ROBERT J. BEALE, A R.I.B.A., ARCHITECT.

A.A. STUDENTS' DESIGNS.

LAST week the Architectural Association medal drawings and the designs made in the School of Design were exhibited at 56, Great Marlborough Street, W. The subject set for the A.A. medal was "A Private School for Fifty Boys," for which eight sets of designs were submitted. On the whole these were of very fair merit, but exhibited various and vast differences in the matter of arrangement and accommodation; for instance, "Pat McKann" provides only two classrooms 16ft. sq. and a dining-room 14ft. by 20ft.—for fifty boys—while "Festina Lente" makes his classrooms a little larger and his dining-hall 53ft. by 25ft. "No. 36" sent no ground-floor plan. Some of the designs showed buildings of considerable size, while others were alarmingly small; but, taken as a whole, they showed promise, the planning being generally fairly simple. As regards the exterior, the design by "Pat McKann"—who has been awarded the medal—is certainly the best, but the wings on each side of the entrance do not balance well, those on one side especially being muddled. "Pat McKann," by the way, is evidently a humourist, for over his dining-room mantelpiece appears the following motto: "What we want is more meat." "Ut Umbra sic Vita" makes his dining-hall a central feature, being approached by a flight of steps; and the effect is good. "Wackford Squeers" had a curious parapet, and the design as a whole gave one the impression of a mixture of some new municipal offices enhanced by features of Haddon Hall. "Chuzzlewit Junior" exhibited a good design, "Truant" had a badly-coloured set of drawings, and "Section IV." was equally crude in pencil with a sepia perspective.

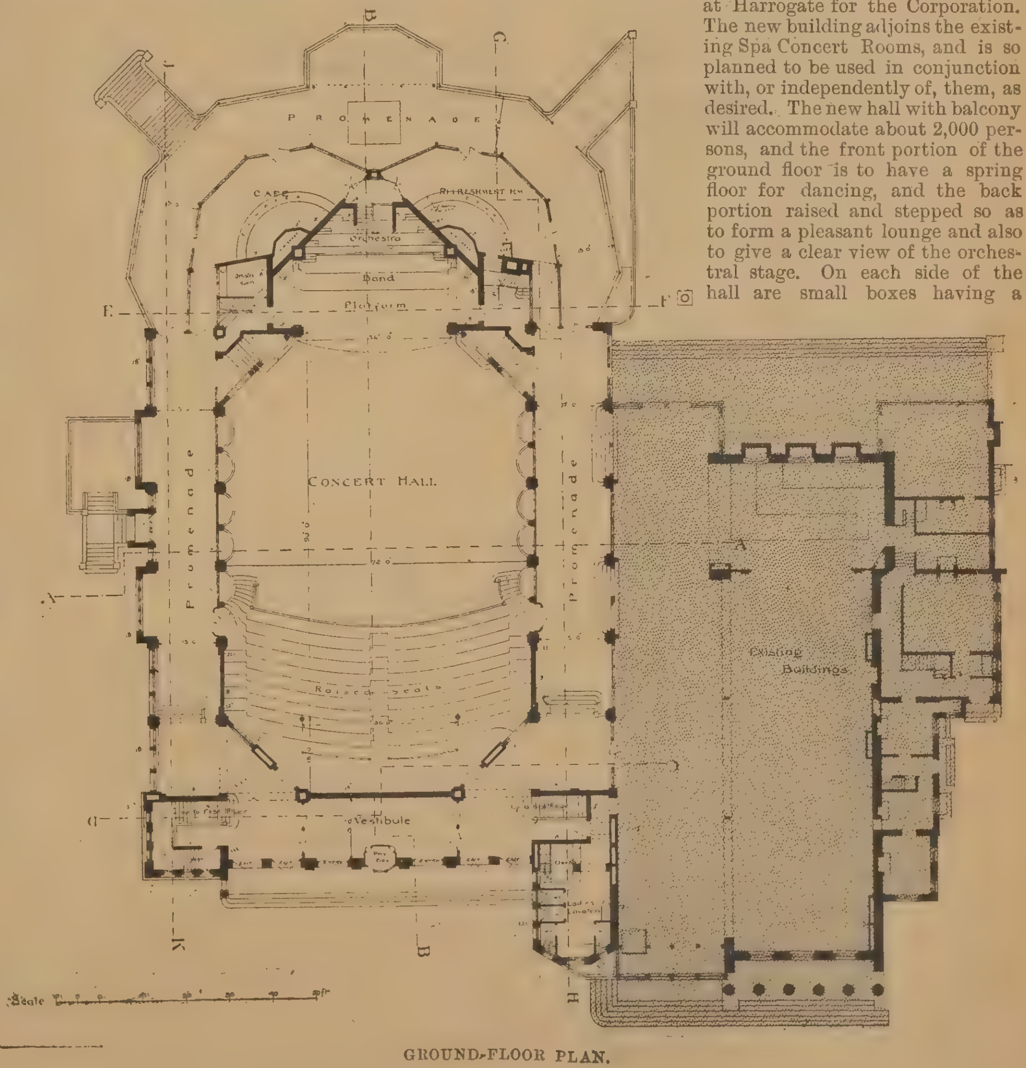
The A.A. Union prize has not been awarded, only one set of drawings (of Gwydyr House) being sent in this year, and these were not considered of sufficient merit.

The Banister Fletcher Bursary was won by Mr. T. Frank Green, who showed good pen and ink work and pencil work of Morden College, Blackheath, and St. Margaret's Church, Ipswich; Mr. Alfred C. Bosson exhibited very excellent measured drawings of the church of St. Mary Woolnoth and Inigo Jones' banqueting hall in Whitehall; Mr. A. R. Conder's drawings of various churches were far inferior to them.

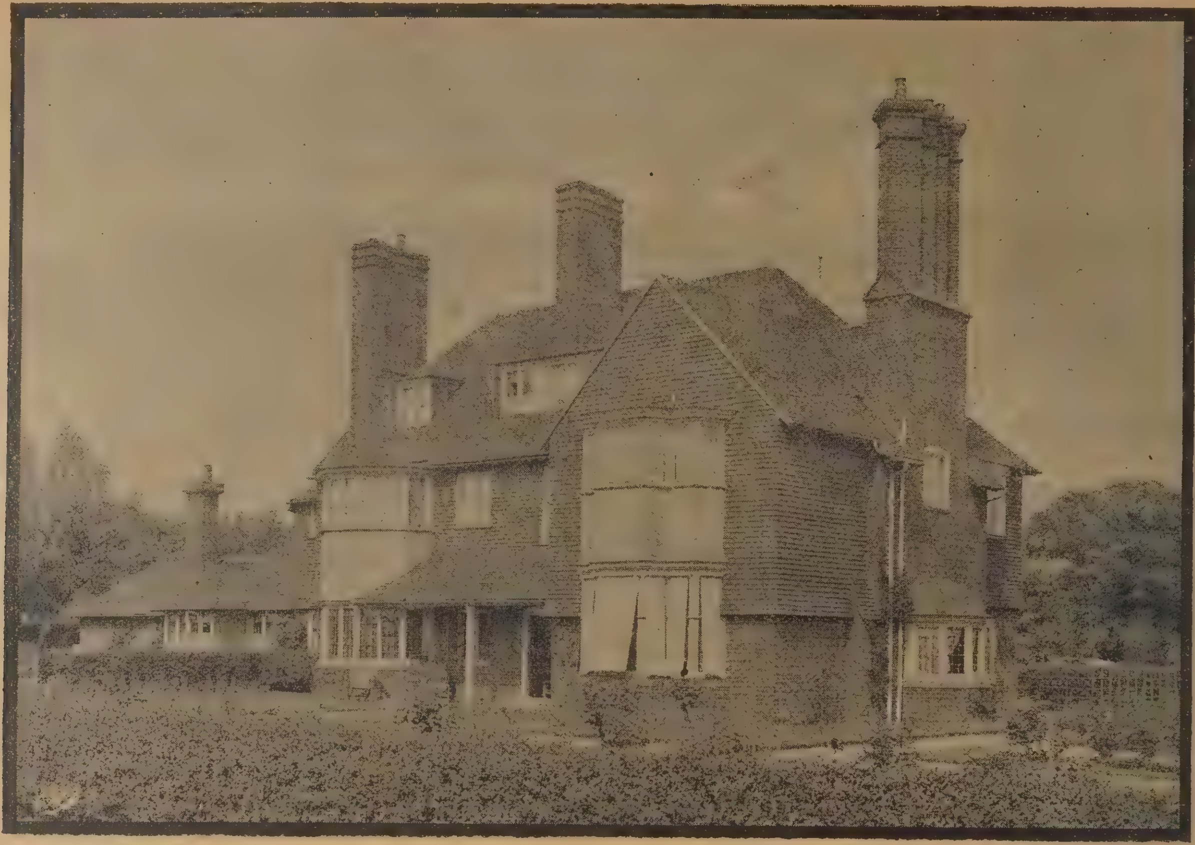
In the School of Design the subjects of "A Village Church," "A Terrace to a Country House," "Almshouses for Twelve Inmates at Maidstone," "A Staircase," "A Lych Gate," "A Grill" and "A Dairy in a Private Park" drew forth some strange and wonderful things, the prevailing tendency being towards novelty. Some of the designs for the dairy were very praiseworthy, those of Mr. E. H. Bullock and Mr. Ernest G. Theakston deserving special mention.

HARROGATE'S NEW KURSAAL.

ILLUSTRATIONS are given on this page of the new kursaal now in course of erection at Harrogate for the Corporation. The new building adjoins the existing Spa Concert Rooms, and is so planned to be used in conjunction with, or independently of, them, as desired. The new hall with balcony will accommodate about 2,000 persons, and the front portion of the ground floor is to have a spring floor for dancing, and the back portion raised and stepped so as to form a pleasant lounge and also to give a clear view of the orchestral stage. On each side of the hall are small boxes having a



GROUND-FLOOR PLAN.

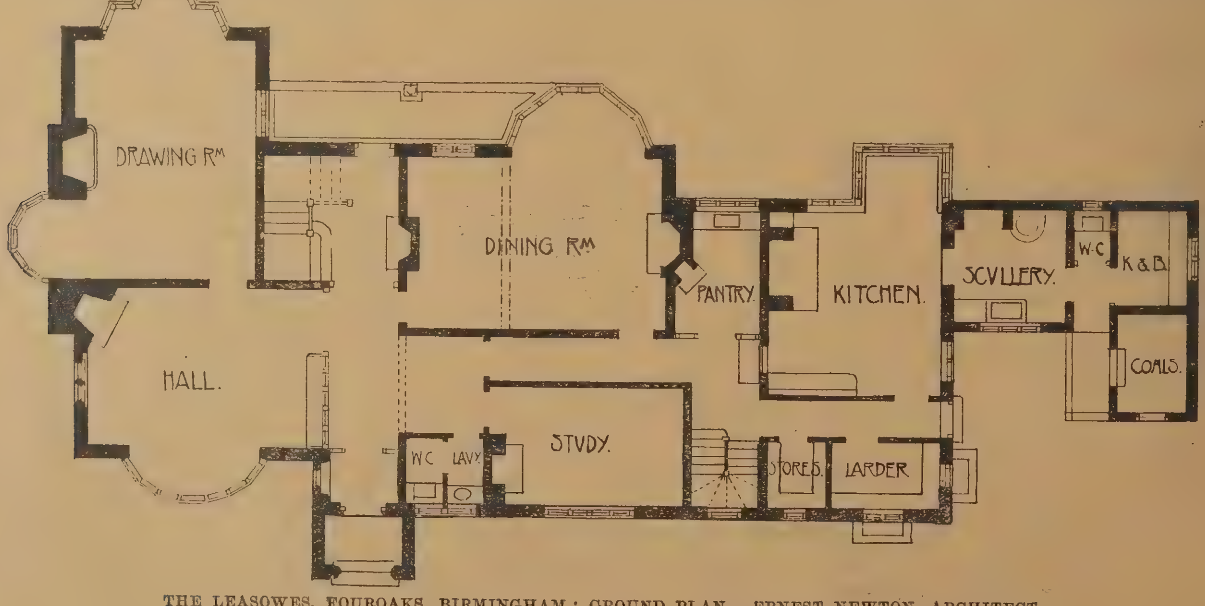


THE LEASOWES, FOUROAKS, BIRMINGHAM : GARDEN FRONT. ERNEST NEWTON, ARCHITECT.

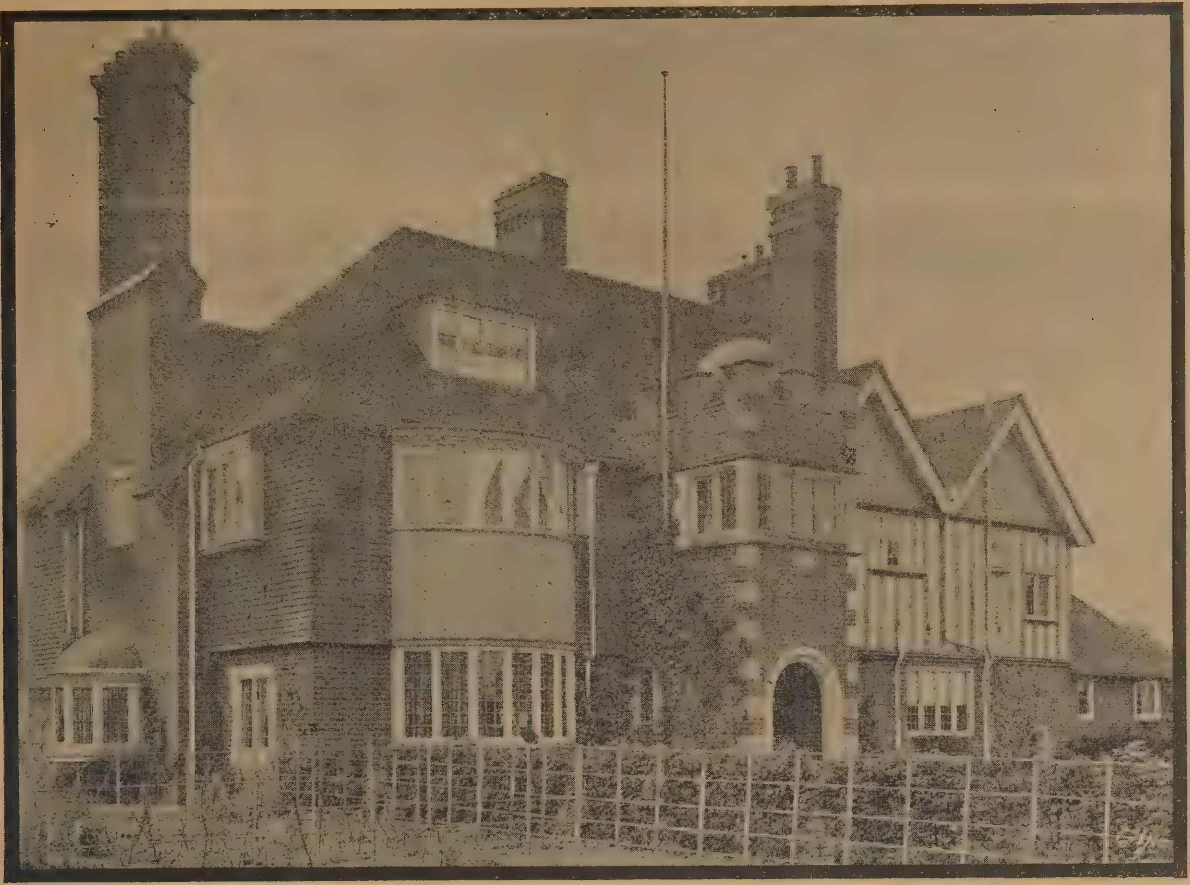
sliding screen between them and the promenades, the floors being on the same level. On the first floor a wide balcony and lounge are at the back and narrow wings at each side, all well stepped so as to give a clear view. Careful attention has been given to the provision of entrances and exits, which are ample for rapidly clearing the building. A spacious promenade extends around the whole building with alcoves, refreshment-room and café in connection therewith. In the basement are the lavatories and cloakrooms, male and female chorus rooms, bandroom, kitchen, &c.; and in a pleasant position under the promenade at the back is a billiard-room suitable for two tables and having an entrance by a staircase from the promenade over and also from the grounds direct. Externally the building will be faced with coursed Pateley Bridge rock-faced wall stones, with dressings and moulded work of Killinghall stone. The roof will be covered with Westmorland green slates. The architect is Mr. Robert J. Beale, A.R.I.B.A., of Broadway House, Westminster, whose design was selected in competition by the assessor, Mr. Frank Matcham (who also suggested various modifications which have been adopted). Mr. Beale will be responsible for the decoration and furnishing of the interior. The total cost is expected to be about £40,000.

THE LEASOWES, FOUROAKS.

THIS house, built for Mr. Sadley from the designs of Mr. Ernest Newton, is one of the many new houses which have been erected on a large building estate at Fouroaks, near Birmingham, which has been developed during the last four years. It is needless to say that many of the new residences are by no means successful from an artistic or architectural point of view. In the majority of cases this result is due to the use of unsuitable material, such as common, local, misshapen bricks, of an unpleasant pale-pink colour, and machine-made tiles, poor in colour and texture, and so close-fitting as to give the roof the appearance of being cut out of a piece with scissors. Sham half-timbering—*i.e.* deal or oak framing 2in. think, nailed on to the outside of the brick walls, with the panels plastered or cemented—is a common vice; lastly, there is a good deal of straining after effects which do not inevitably arise from the interior arrangements. Unfortunately, too, some of the better houses are by no means successful in their planning, and even many of the best designs are spoilt by little bays and excrescences which do not materially add to the comfort of the rooms, and which give the elevations an untidy, undignified and fidgety appearance. There is also an unfortunate predilection among the best architects for putting all their bedrooms in the roof, a method that is not only unhealthy and insanitary but gives the maximum of discomfort with the minimum of convenience. There are one or two houses which are exceptions



THE LEASOWES, FOUROAKS, BIRMINGHAM : GROUND PLAN. ERNEST NEWTON, ARCHITECT.



THE LEASOWES, FOUROAKS, BIRMINGHAM: ENTRANCE FRONT. ERNEST NEWTON, ARCHITECT.

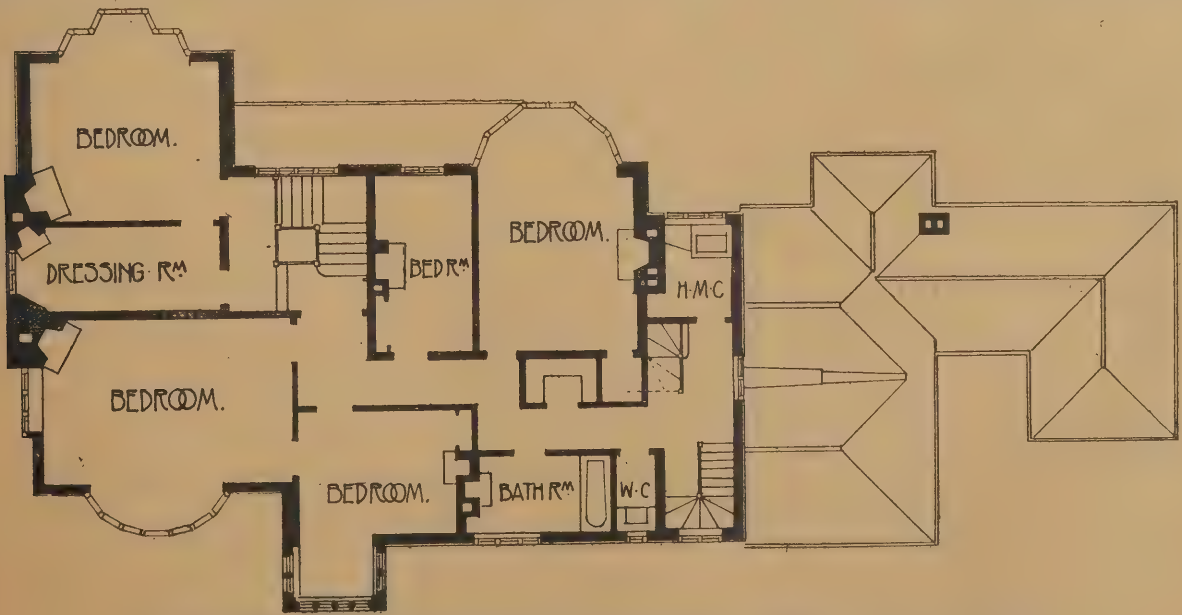
to the general rule, such as "The Leasowes," which we illustrate. Weather tiling has been used on the walls, and this gives the house a somewhat unusual aspect for the Midlands, this type of building being usually associated with the Home Counties. The two half-timbered gables are made of solid oak framing, the pale brown colour contrasting well with the white plaster.

IS A FIREPROOF STRUCTURE POSSIBLE?

THIS is a question which was asked of an architect in connection with buildings of the State institutions of Indiana. "A fireproof structure is possible," was the answer. "Fireproof buildings have been destroyed," was the reply; "and how do you prove your assertion?" The architect said: "Why not consider a cupola furnace? Here is a structure of steel and clay. Where is there a building which may be submitted to such heat, and yet we find the furnace a relatively permanent structure. Of course, this is not an architectural structure, yet it shows possibilities. It indicates that with steel structural supports and a proper use of burnt clay such a structure is indestructible."

Now, it is true that many buildings with a minimum of steel and a minimum of clay protection are quickly and easily destroyed by the burning of a large amount of combustible material in the interior, but who will say that it is not possible to protect a steel structure by the use of burnt clay when he considers the intense heat to which the cupola furnace is subjected? The protection is not relatively heavy, but the work is thoroughly done and well applied. No architectural structure, with the material which it contains in the state of combustion, is ever subjected to the heat which is applied in a cupola furnace. Steel or iron in itself is a material more readily destroyed by fire than wood, yet steel adequately protected presents an absolutely fireproof building.

Many of our buildings are adequately protected in the places where they need it the least; for instance, there is 8in. fireproofing between beams and only 1in. under them. The surface between beams needs the protection the least, and the surface under them or over them needs it the most, and yet it is there where they get it the least. If anyone ever questions the possibility of absolute fire-protection or fireproof qualities of a structure, why not think of the cupola furnace or the coke oven?—From the "Clayworker" (Indianopolis, U.S.A.).



THE LEASOWES, FOUROAKS, BIRMINGHAM: FIRST-FLOOR PLAN. ERNEST NEWTON, ARCHITECT.

CARDINGTON CHURCH.

THE church in the pretty village of Cardington has just been reopened after rebuilding. The new edifice consists of a tower 74ft. in height, nave, the north and south aisles, chancel and north and south transepts. The only part of the old church still remaining are the roof and walls of the chancel, the tombs in the chancel and the east window, while the ancient windows in the chancel have been placed exactly where they were before. The north transept forms a memorial chapel and contains some monuments in high relief on white marble of members of the Whitbread family, while chairs with red kneelers occupy the centre of the chapel. The length of the church is 132ft., the width of the nave is 20ft. 10in., the width of the north aisle is 13ft. 2in. and the width of the south aisle is 11ft. 8in. The lower stage of the tower forms a lobby to the nave, while on the first stage is the ringer's chamber, which also contains the works of the clock. The eight bells have been re-cast by Messrs. Taylor, of Loughborough. Many of them bear quaint inscriptions, which have been fortunately preserved. The Norman arch of the old tower has been removed to its present position at the west end of the nave, and it has been rebuilt stone by stone. The nave has an arcade of four bays, while the arches and caps are moulded after various quaint designs. The columns and the responds are moulded into four circular shafts. The chancel arch is lofty and finely moulded, and the arches from the side aisles to those on either side of the chancel are of a four-centred character. The clearstory has seven two-light windows on the south side and five on the north, where the extra space is occupied by the memorial chapel, which has two windows on either side of the monument and three above. The windows in the aisles have three cinquefoiled lights, with trefoiled lights above; the western windows possess only two lights. The chancer is raised two steps from the body of the church. and the sanctuary is raised two steps higher. The reredos consists of richly decorated panels, There is a coloured east window. Richly ornamented screens of Totternhoe stone divide the chancel from the side aisles, while under them are the altar tombs and brasses of Sir Gerard Harvey and Sir W. Gascoigne. The vestry is at the east end of the north chancel aisle. The organ is placed at the north side of the chancel, and was built by Mr. Trustam, of Bedford. It has a handsome oak case in keeping with the oaken choir stalls, which are decorated with carved "poppy heads." The church is fitted with oaken benches, copied from an ancient pattern in Haddon Hall, Derbyshire. The pulpit, of English oak, is also richly carved, and stands on the south side of the nave. The base consists of pale pink tinted Staffordshire stone. There is a new brass lectern and altar rails. The font is of white Mansfield stone, septagonal in form, symbolical of the "perfect sevenfold gifts and graces of God as the sanctifying Spirit." The central panel is ornamented with a carved representation of the descent of the Dove, and the other six panels have cinquefoiled arches. The font rests on a central shaft surrounded by seven small granite shafts with stone bases and caps. The flooring of the church consists of white Mansfield stone with squares of black marble, while the roofs are of the best English oak. In the wall of the south transept is embedded an Anglo-Saxon coffin slab and a number of early English slabs, which were found in the Norman portion of the tower. The exterior of the church is purely Perpendicular in style. The stone for the walls has been brought from Tansley Moor, Matlock, and is laid in random-coursed work, and all the new dressings are of Ketton stone. The roofs are embattled. Above the western door is an arcade of ten panels, which ornaments the front of the tower, each panel having two cinquefoiled arches. The hood corbels of the arch are richly carved floral designs. Quaint old clock dials (restored by Messrs. Smith & Sons, Derby) are to be found on the north and south sides of the tower, and there is a small one which deserves attention as it is an Anglo-Saxon sundial. The larger sundial was erected in 1782. The outer archway of the south porch is four-centred, with a square head with spandrels bearing floral designs and a richly carved finial rising from the keystone of the arch. Arcades of cinquefoiled ogee arches fill the space on either side of the spandrels and above the arch to the cornice of the embattled gable. The north outer wall of the transept is ornamented with an arcade of ten arched panels, like those on the west of the tower and the south wall of the porch. The heating apparatus is placed in the basement of the tower. The architect was Mr. George Highton, A.R.I.B.A., of London, who was assisted by Mr. G. T. Fields-Clarke, F.S.I., land steward to Mr. Whitbread, at whose expense the work has been carried out.

LIVERPOOL'S NEW HOSPITAL.

THE new David Lewis Northern Hospital at Liverpool is rapidly approaching completion. It is estimated to cost about £120,000. The site on which the hospital stands covers an area of about 12,000 sq. yd.; it has an extensive frontage to Great Howard Street, and it is bounded on the south by Leeds Street and on the north by the Lancashire and Yorkshire Railway. The institution has been erected from plans by Messrs. Pennington & Son, of London, and Mr. C. W. Harvey, of Rodney Street, Liverpool, whose designs were selected out of a large number that were submitted to the committee. Simplicity of arrangement combined with sufficient compactness and concentration to ensure easy and economical administration has been the chief feature aimed at, and the buildings have been so distributed as to obtain the fullest amount of sunshine without crowding them so closely as to impede the free circulation of air.

The hospital affords accommodation for 220 patients—108 surgical cases (72 male, 36 female), 72 medical cases (48 male, 24 female), 20 children, and 20 cases in special wards. The institution consists of three pavilions—one circular and two rectangular—each three storeys in height. The three wards of the south pavilion are occupied by the male surgical beds, on the ground and first floor wards of the circular pavilion are the female surgical beds, and on the top floor are the children's beds; and in the north pavilion are situated the medical beds, the males on the ground and first floors and the females on the second floor. The rectangular wards are 26ft. in width, 94ft. in length and 13ft. in height, while the circular wards are 50ft. in diameter and the same in height as the rectangular ones. The walls of all the wards are finished with Parian cement and varnished, and all angles and junctions of walls with floors and ceilings are rounded. Each rectangular ward has a light iron verandah, overlooking the well laid out ground in front of the hospital. Special attention has been paid to the question of ventilation, what is known as the "natural system" having been adopted for the large wards, the windows being placed opposite to each other, with fanlights hung to fall into hoppers. On each pier a leather radial ventilator is fixed at the ceiling level, and under each bed is a leather louvre ventilator, the vitiated air being extracted by means of flues formed in the chimney shafts passing through the roof. Adjoining each ward are rooms fitted with all the conveniences necessary for proper attendance on the patients.

Each of the large wards is to accommodate twenty-two beds, and each floor of the building is practically a separate hospital in itself. Besides what may be described as the public wards, there are nine private ones for paying patients, and a number of isolated wards for the treatment of specific diseases, including erysipelas wards, tank wards designed for the comparatively new mode of treatment in antiseptic water of typhoid cases, and wards for patients suffering from lupus. While on the question of wards, mention must be made of the manner in which that set apart for the children is designed. Around the entire upper portion of the wall are illustrations and texts of well-known nursery rhymes, the object being to direct the attention of the little patients from their sufferings to the doings of the characters in nursery books known to most children. The paintings have been executed by Mr. Martin, of Hardman Street. Above this ward is a flat concrete roof with a shelter, intended as a playground for the children in fine weather. There is a Swedish gymnasium, which is fitted up with delicately balanced instruments for recovering the use of limbs that have become stiffened through accident, a method somewhat new to this country. The operating theatre is replete with all the latest appliances necessary for the carrying out of operations of every description, and communicating with it are the anæsthetic and recovery rooms. Photographic and analysis rooms are also provided. Turkish, Russian, electric and vapour baths form a feature. The basement floor where these baths are situate also contains a large concert-room, dining-rooms for medical officers, nurses, servants and porters, and various offices essential to the successful conduct of the institution.

The administrative department is centrally situated and within easy access of the other parts of the building. The main entrance to the hospital is from Great Howard Street across a large stretch of ornamental ground which has been laid out by Mr. H. E. Milner, the well-known landscape architect from the Crystal Palace, and up a wide flight of steps. These lead into a vestibule lined with marble, and then into a spacious hall panelled in oak and treated with faïence work in the Renaissance style. Opening out of this hall are the various offices connected with the administration of the hospital. On the east side of a large yard to the rear of the hospital are placed the disinfecting-house, the mortuary, the post mortem-room and the pathological museum. Two other departments that require a passing mention are the laundry and the kitchen. The requirements of each have been met in the fullest manner possible, and both are so situated as to be easily reached from all parts of the hospital.

For all practical purposes the out-patients' department has been arranged to form a separate and distinct building. It is approached by the Leeds Street entrance, and patients after passing the vestibule and registration office enter the large waiting-hall, on three sides of which are grouped the consulting, surgical, medical and ophthalmic rooms. When they have been examined in the consulting-rooms patients can proceed direct to the dispensary and leave the building without again going through the waiting-hall. Adjacent to the out-patients' department is the casualty-room, where all accident cases are taken for the purpose of preliminary examination, and near to this again is a padded room for the reception of violent patients.

The Nurses' Home, where accommodation is provided for sixty-six nurses, is connected on the ground floor only with the hospital, and is entered from the main corridor near to the Leeds Street entrance through a large conservatory. On either side of a corridor running the entire length of the block are the bedrooms and necessary bathrooms, and at the end of this passage is a spacious octagonal sitting-room. This description applies to each of the three floors into which the block is divided. The sitting-room on the second floor also combines a library. Attached to the home is a school for teaching hospital cookery. The basement is occupied by the chapel and hospital library.

The new hospital covers the site occupied by the old building. The contractors for the hospital, which is faced externally with red Ruabon bricks, have been Messrs. Thornton & Sons, of Liverpool, and the clerk of works was Mr. J. Gillings.

The Statue of the Empress Elizabeth at Salzburg, erected by the ladies of that city, was unveiled recently by the Emperor of Austria.

Society of Arts: Applied Art Section Committee.—At the last meeting of the council the following were appointed to form the committee for the ensuing year: Sir William Henry Preece, Sir George Birdwood (chairman), Thomas Armstrong, Professor Church, Caspar Purdon Clarke, Alan S. Cole, Sidney Colvin, Walter Crane, Lewis F. Day, I. Hunter Donaldson, Major-General Sir John Donnelly, Arthur Evans, Sir John Evans, Hon. Sir Charles W. Fremantle, J. Starkie Gardner, William Gowland, Arthur Lasenby Liberty, Sir Villiers Lister, T. Buxton Morrish, J. Hungerford Pollen, Sir Edward Poynter, Sir Walter S. Prideaux, Sir W. C. Roberts-Austen, Alexander Siemens, A. B. Skinner, John Sparkes, R. Phené Spiers, Hugh Stannus, H. H. Statham, Joseph William Swan, Carmichael Thomas, John I. Thornycroft, Sir Thomas Wardle and Henry B. Wheatley (secretary).

Keystones.

The National Gallery (Purchase of Adjacent Land) Bill has been passed.

Dursley Parish Church is being renovated by Messrs. King, of Gloucester.

Illness of Mr. Alfred Waterhouse, R.A.—We regret to learn that Mr. Alfred Waterhouse, R.A., who is staying at his country residence at Yattendon Court, near Newbury, is ill.

The Old Racecourse Buildings at Ascot are to be pulled down to make way for new and more commodious erections, which are to be completed by the next race meeting.

A New School at Eaglesham, Glasgow, has been erected from designs by Mr. Alexander Petrie, architect, of Glasgow. The building occupies a site on the Strathaven Road, and accommodation is provided for 220 scholars. The cost is estimated at £2,800.

New Public Baths at Elland are in course of erection on land adjoining the Public Offices. The scheme, which entails an outlay of £6,000, has been entered upon at the express wish of the ratepayers as Elland's recognition of the Diamond Jubilee of the reign of the late Queen Victoria.

Chester Cathedral Restoration.—Sir Horatio Lloyd, one of the honorary secretaries of the committee which is carrying out the restoration of the south transept of Chester Cathedral as a memorial to the late Duke of Westminster, announces that the total cost will be £9,720, and of this £8,718 has been subscribed.

The Birkenhead Town Hall Fire has caused damage assessed at over £15,000. The tower, with the clock and the cupola, the valuable stained-glass roof over the council chamber, the council ante-room, and the roof of the main building will, it is understood, be repaired and rebuilt to its former condition, and this cannot be done for less than the amount stated above.

One of the Leaning Towers of Italy, it is reported, is in danger of falling. Fortunately it is not the Pisan marvel, but an ungraceful square brick monument which rises almost to the same height as the Tower of Pisa, and is situated in Bologna. The municipality is trying to patch up the cracks, thereby thinking to avert danger, but the Italian Press does not share this optimism, and has demanded that a more serious effort be made for ensuring the structure from ruin and the safety of the people who dwell in its shadow.

College Street Archway, York.—At the last meeting of the York City Council a discussion arose with respect to the improvement of College Street and the pulling down of the old gateway. The Streets and Buildings Committee recommended that the city engineer be instructed to proceed with the pulling down of the archway at once, and that the further consideration of a new street be adjourned. Alderman Agar, in moving the adoption of the recommendation, said the pulling down of the archway would not hinder them from going on with a new street to the south side of the Minster. A great deal had been said about keeping up the archway, but personally he thought its demolition would open up one of the finest views of the Minster. Alderman Sir J. S. Rymer moved as an amendment: "That, subject to satisfactory arrangements being made for a new road in lieu of College Street, this council is willing to cancel the agreement dated March 19th, 1901, with Mrs. S. R. Wood, for the purchase of College Street Archway, and that all resolutions inconsistent with this resolution be rescinded." He repudiated any love for the arch, but expressed his great love for the Minster, and his belief that no right-minded citizen would wish to do anything that would in any way endanger that structure. The advisers of the Dean and Chapter contended that the traffic through College Street past the Minster had considerably interfered with the stability of the east end, and surely their opinion was entitled to respect. If they succeeded in getting a new street, what did it matter whether the arch stopped up or came down? The amendment was carried.

The New Victoria Wing to Blackburn Infirmary has been opened. The cost has been £11,500.

A Bust of Louis Français, the landscape painter, was unveiled at Plombières last week.

A Bust of Clairon, the actress, was unveiled recently at Condé sur l'Escaut.

A Correction.—In the notice of the Lawrence Patent Water Softener and Sterilizer Co., Ltd., of Norland Works, Uxbridge Road, Notting Hill, W., which appeared on page x of our last issue, the cost of working their apparatus was erroneously stated to be 13s. 4d. instead of 1¾d. per 1,000 gals. We regret the error.

Discoveries at Canterbury.—Discoveries have been recently made in the course of excavating the ruins of St. Augustine's Abbey, Canterbury, of a gold noble of Edward III., the leaden seal which had been attached to a bull of Pope Alexander III. (1159–81), and remains of an Early Saxon chapel dedicated to St. Pancras.

The Leeds and Yorkshire Architectural Society paid a visit on Thursday last to Wheatfield Lodge and Castle Grove Headingly. The excursion was conducted by Mr. Butler Wilson, F.R.I.B.A., president of the society from whose design these two houses have recently undergone alterations and additions.

A Statue of the late Duke of Devonshire, which was for some time on view at the Royal Academy, was unveiled on the sea front at Eastbourne last Saturday. The statue represents the late duke in a sitting posture, wearing his robes as Chancellor of the University of Cambridge, and Mr. Goscombe John, the sculptor, is considered to have produced an excellent likeness.

Failure of Mr. Alfred Gilbert, R.A.—At the London Bankruptcy Court last week an application was made to Mr. Registrar Giffard for a receiving order against the estate of Alfred Gilbert, R.A., who has presented his own petition, describing himself as of 16, Maida Vale, sculptor. Upon the application of Mr. Guilford E. Lewis, the registrar made the usual receiving order. Nothing was stated as to the debts or assets.

The New War Office is begun. The huge pit opposite the Horse Guards, which has been "setting" for the past few months after its thick inlay of concrete, is now in possession of the first batch of builders, who are preparing to lay the foundations. Scaffolding and cranes are springing up out of the concrete depths, and in many other ways there are indications of the beginning of the first of the two new Government buildings. The walls and bed of concrete which were first constructed were necessitated by the unstable subsoil of the river bank.

Gold and Silver Work at the Louvre.—All the objects of mediæval and Renaissance gold- and silver-smiths' work left by Baron Adolphe de Rothschild to the Louvre have now been placed in that establishment. They are in a special room. The collection of objects of art was highly valued by the baron, and chiefly consists of reliquaries, statuettes, chaplets or rosaries, medallions, medals, monstrances for the Sacrament, ciboriums, chalices and miniatures of the thirteenth, fourteenth, fifteenth and sixteenth centuries. These precious articles are in gold, silver, enamel, bronze, rock crystal, and so on. They are splendid specimens of Italian and Flemish work, notably the reliquaries. The collection will not be open to the public for some weeks to come. The Cluny Museum has also received fourteen objects of art from Baron Adolphe de Rothschild's collection.

New Factory for Messrs. Broadwood.—An opportunity for acquiring a unique site either for manufacturing premises or town properties has arisen owing to the decision of Messrs. Broadwood, pianoforte manufacturers to his Majesty the King and Queen Alexandra not to remove their works from London as was originally proposed. They have purchased a freehold site for their new factory at Bow, and are contemplating the disposal of their Bedford property, which consists of more than twenty acres on the west side of the town immediately adjoining a quarter which is rapidly developing. The site is most suitable for building operations of any kind, being perfectly level, the soil gravel, and close to the town, the river and the railway station. Architects or builders can obtain full particulars from Messrs. May & Rowden, 39, Maddox Street, London, W.

TO NON-INSURED READERS.

From time to time we have queries addressed to us by readers on points affecting our Accident Insurance Schemes. The greater number of the queries relate to the conditions of payment, and to enlighten those who may still be in doubt we think it desirable to state

(1.) That it is not necessary to subscribe direct to the office in order to secure the benefits.

(2.) That even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.

(3.) It is sufficient to have an intimation from the newsagent that he supplies copies regularly.

(4.) That policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.

(5.) In applying it is not necessary to write a long letter—a postcard will do, giving the full name and address of the newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

Scheme No. 1 is a free Accident Insurance of **£500.**
FREE.

(Every regular reader of the Builders' Journal is entitled to this without any payment.)

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, Premium, £3/-/-

Hazardous Risks, Premium, £3/10/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

If these schemes interest you, write for full particulars to

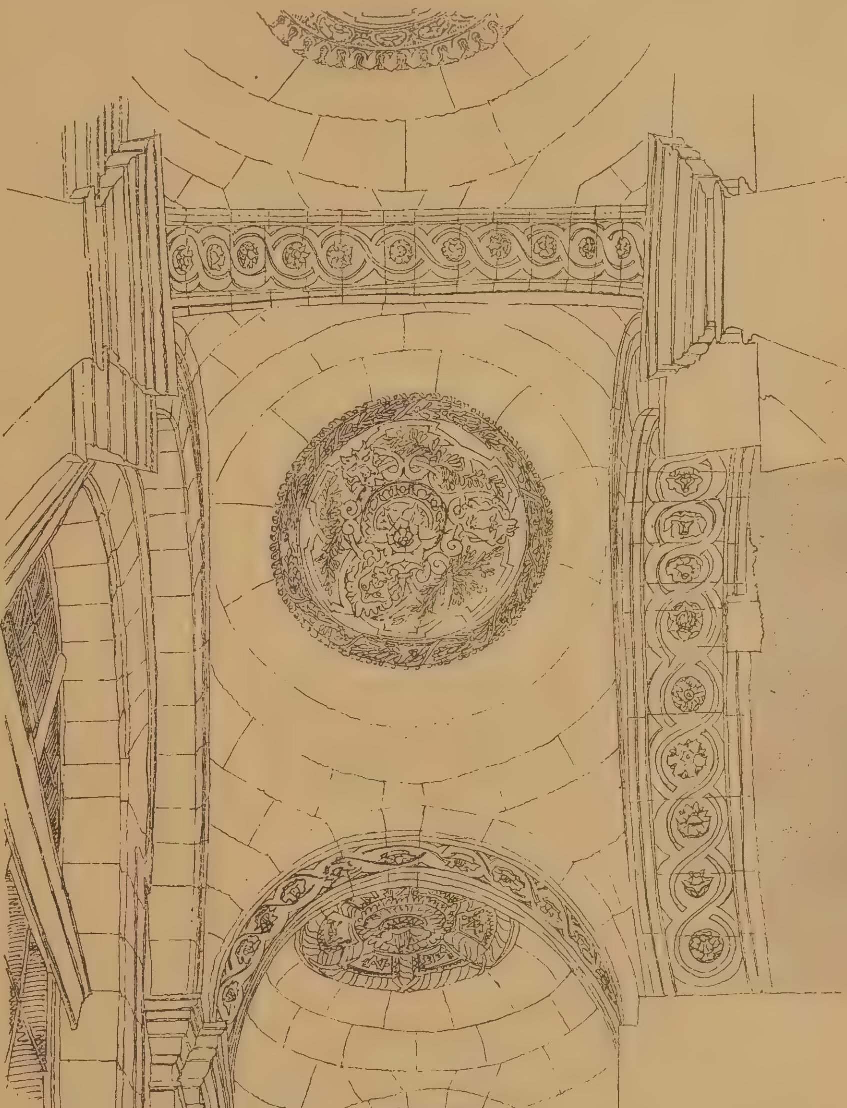
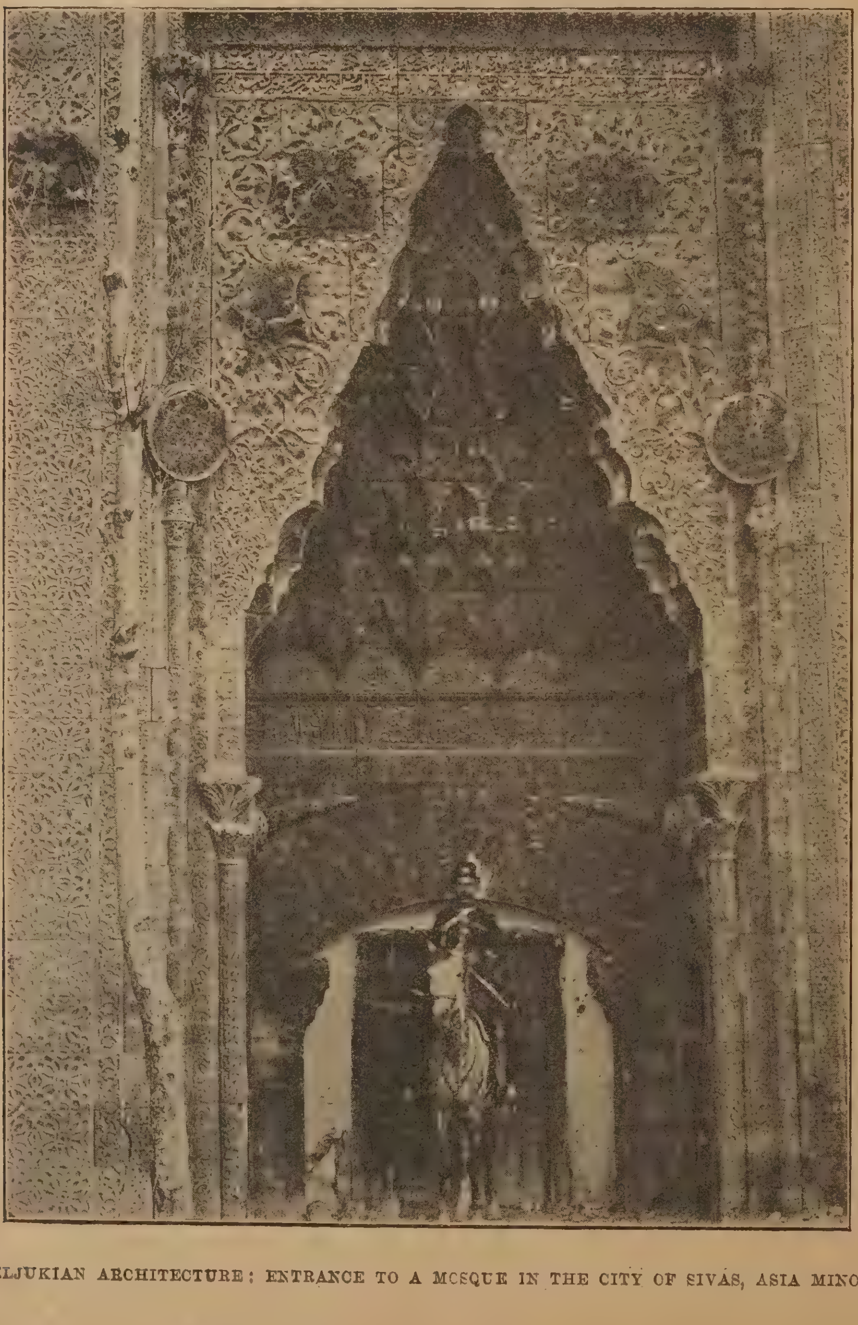
An Architectural Causerie.

The Public Press and Architecture. WHENEVER questions of taste are under discussion among those who consider themselves cultured, the opinion is invariably expressed that the public has no taste, or, to be more correct, has bad taste. To some persons this explains why popular art and architecture are of such inferior merit, others asserting that just in proportion as the art is bad so is the public taste which it governs. This applies equally to literature and the drama: either the bad taste of the public is responsible for commonplace books and trivial plays, in accordance with the law of supply and demand, or the "producers" capture the public and tell them what they need, even though it be what Carlyle terms "the black slough of platitude." Whatever be the reason—and we have our own opinion—the fact remains that public taste follows a low standard. This is not flattering to us as a nation, and it therefore behoves anyone in a position to do so to endeavour to set a better standard of excellence before the public; it is futile to act on Mr. George Moore's advice and "kick the brute in the ribs." Considering how public opinion is governed by the daily press, it is to be regretted that its influence is so feeble in the domain of architecture—in fact its influence is too often most harmful. In this connection we may refer to the article on "Some Handicaps of American Provincial Architecture" in our issue for August 8th, 1900, in which Mr. E. C. Gardner said: "I have never seen or heard of a newspaper, however high its journalistic standards, however earnestly it strives to be impartial, however faithful and without regard to profit or popularity it espouses what it conceives to be the right side of the questions that have a right and a wrong side, however valiantly it tells the truth in other matters of public and private concern—I have never seen or heard of a paper whose influence upon the architecture of its local field was not damaging rather than beneficial. Nothing is more essential to the healthful development of art in all forms than intelligent public criticism—judicious recommendation of the good and frank; explicit, detailed condemnation of the bad. Music, the drama, landscape, architecture, painting and monumental statuary are criticised wisely and often most healthfully by the competent writers employed by the best provincial journals. But the moment they touch the architecture that lies nearest them, and of which simple but uncompromising criticism would be valuable, their pens are dipped in oil. Now it is undoubtedly true, whether happily or otherwise, that the opinions of the great majority of people in all matters æsthetical are largely determined by the comments and intimations of the public journals. So it happens that in architecture whatever the newspapers approve (and to an extent they are obliged to approve every new growth, even if it is a parasite or a mushroom, or be accused of a lack of proper public spirit) is accepted as good, and, woe the day, is sure of imitation." With slight alteration this can be applied to England as to America. The public press abounds with foolish criticisms of architecture. The latest that has caught our eye concerns Short's in the Strand. Owing to their old premises being demolished for the clearance of the site for the new Gaiety restaurant and theatre, it was decided to move a few doors away and utilise the "Coach and Horses" for a time. Accordingly, a temporary front has been erected on the new building line and behind the old front of the "Coach and Horses," which is now being pulled down, exposing Short's new front. Now this is what a London daily newspaper which counts its readers by hundreds of thousands has to say about this "new old building": "Beams, plaster and the rough mortar work of Tudor times are adopted by the firm as good materials for ornamental and cheap temporary premises. Temporary only, for soon they will have to fall before the contractor's ruthless hands. It will be a nice little reminder of old England to see the finished building, cross-beams and all, standing out from among the useful but not ornamental brick structures around it. Other architects might take a leaf from Short's book, and instead of constructing ramshackle premises, might adopt the fashion of other reigns—in time making the Strand a study in historical architecture." Such nonsense as this needs no comment, but it is surprising that a paper of standing should print it. Does it tend to improve the public taste in architecture? As a matter of fact, the new front is practically a thin partition faced with sham half-timbering, so that it is hardly a "nice little reminder of old England," nor does it tend to make the Strand "a study in historical architecture." Unfortunately, examples like this one are easy to find in the public press, though now and again one discovers a criticism which shows that the writer knows what he is talking about: such is the case of the writer of the article on "Recent Building in Manchester" which we take the liberty of reprinting this week from the "Manchester Guardian." If the member of the staff of the London "daily" to which we have referred (and others of his kind) would observe the methods adopted in the "Manchester Guardian" article, instead of advising architects to "take a leaf from Short's book," the result would be more beneficial to architecture and better for the reputation of the public press as a critic of this subject.



VAULTING IN THE LOUVRE, PARIS. VISCONTI AND LEFUEL, ARCHITECTS.
DRAWN BY H. F. COOKE.

Two French Architects. THE following particulars are given in connection with the two illustrations of vaulting in the Louvre, Paris, and a balcony on the ground floor of the Pavillon de Marsan, which appear respectively on the previous page and on page 37:—Louis Visconti, the son of Ennius Quirinius Visconti, the celebrated archæologist, was born at Rome in 1791, and went to Paris seven years later. Here he became a student of Percier, and after gaining distinguished prizes at the Academy succeeded Delannoy in 1825 as the architect of the Royal Library in the Rue de Richelieu. Visconti designed numerous houses and hotels in Paris, chiefly in the suburbs of Saint-Germain and Saint-Honoré and in the quarters of the Michodière and the Chaussée-d'Antin. The fountains of Gaillon Square, Place Louvois and Place Saint-Sulpice, the monument to Molière in the Rue de Richelieu, and the tombs of numerous French marshals were also from his hands. But his two greatest works were the tomb of Napoleon the First, beneath the dome of the Invalides, and the plan for the completion of the junction of the Louvre and the Tuileries; the latter was begun in 1852, and everything had passed the foundation stage when Visconti died at the end of the following year. Visconti received the distinction of the Legion of Honour in 1846, was Architect to the Emperor in 1853, and became a member of the Institute and President of the Central Society of Architects during the same year.—Lefuel was born at Versailles in 1810 and died at Paris in 1880. He was a student of Huyot and secured the second Grand Prix of architecture in 1833 and the first Grand Prix in 1839. After a stay at Rome he came back to Paris and (in 1845) was nominated inspector of works of the Chamber of Deputies. He was architect of the Château de Meudon in 1848, of the Sèvres manufactory in 1852, and of the Château de Fontainebleau a year later. He had the fortune to fall into the good graces of Napoleon the Third, for whom he designed the new playhouse in the right wing of the Emperor's last residence. In 1845 Lefuel succeeded Visconti as architect in chief of the works of the new Louvre; the Grand Court was completed in 1857. Lefuel entirely restored the gallery at the edge of the water, joining the Pavillon de Lesdiguières with the Pavillon de Flore. This gallery was constructed between 1860 and 1870, and is remarkable for the three grand arcades which give access to the Place du Carrousel. During the same years Lefuel remodelled the Pavillon de Flore in the Tuileries from top to bottom, and built the new Salle des États leading on to the Place du Carrousel. A few years later he built the new Pavillon de Marsan. As his most successful works may be mentioned the grand hall and stair of the library in the Louvre. Lefuel also designed the hotels Fould and Nieuwerkerke, and the tomb of Auber.



SELJUKIAN ARCHITECTURE: ENTRANCE TO A MOSQUE IN THE CITY OF SIVAS, ASIA MINOR.

NOTES ON SELJUKIAN ARCHITECTURE.

By Rev. G. E. WHITE, of Marsovan, Turkey.

ABOUT the time that the Normans were stirring Western Europe a Turkish tribe called Seljuks rose out of the vast wilds of Turkestan, to turn and overturn in Western Asia. Toghrul Bey, Alp Arslan and Melek Shah were nearly contemporary with William the Conqueror and the leaders of the first Crusade. They rollicked not over the sea but the steppe, and they finally conquered and constructed for themselves a fair but short-lived kingdom in Asia Minor and the regions adjacent. The Seljuks belonged to the Mongol family of men, were first cousins to the Moguls of India, predecessors and distant relatives of Genghiz Khan and Tamerlane, and were the forerunners of the Ottoman Turks, into whose greater empire they were early merged.

The Seljuks soon lost their national identity, and few care anything for them now; but for two or three reasons their name deserves to be remembered. They were the ones who roused Christendom to that mighty upheaval known as the Crusades. The Holy City and the Holy Sepulchre had long been in the hands of Mohammedan Arabs, who treated their relatives the Jews and their rivals the Christians with comparatively good-natured contempt, kicking them occasionally lest they should forget the true feeling of a Mohammedan for a Christian. But when the Seljuks conquered the sacred shrines it was no good-nature with which they treated pilgrims, and a monk named Peter, of a small figure but a fiery soul, was roused by the indignities he saw heaped upon his fellow-pilgrims from Europe, and roused Pope Urban and all Christendom in turn, until they embarked upon the Crusades. Our purpose is served by noticing that this great movement was directed against Seljukian Turks.

As the Normans were early absorbed in greater empires than their own, so the Seljuks with their capital at Iconium soon gave way to the kindred kingdom of the Ottomans, with their capital, after 1453, at Constantinople. But even yet, when the accession of a new Sultan of Turkey calls for the ceremonial that corresponds with the coronation of a Western sovereign, the old Seljuk sheikh leaves his residence at Iconium and, journeying to the capital, performs the ceremony of girding upon the thigh of the new sovereign the sword of Othman.

The Seljuks also deserve a page in the history of architecture for their interesting public buildings of stone, vanishing remnants of which may be seen by the modern traveller almost anywhere in Asia Minor. As stated, the Seljuks were the near relatives of the Moguls—that is, Mongols who subsequently built the Taj Mahal at Agra, and worked so well in all manner of building with stone that some claim that their work in this line surpasses that of all other people.

The Seljuks left no single building worthy to be compared with the Taj Mahal, but Asia Minor is scattered over with mosques, gateways, fountains, Government buildings, religious colleges and other schools built from 400 to 800 years ago by the Seljuk Turks in a style which the Ottomans never emulated and no other people of this region ever imitated. The style is marked and its varieties are few. It is massive like the Hittite, though not so coarse. It lacks the delicacy and beauty of the Greek, though very beautiful in its own way. It has no sculptures of men or women, being Mohammedan and not Christian; and it has no representations of animals, being Mohammedan and not heathen. It seems to be connected with the architecture of Persia, the country to which all Turks look as the home of the fine arts. The best specimens all consist in the carving of the huge stones that form the front of some building. Rosettes, flower-work, wheels, rope-work, chain-work, squares, diamonds, and other geometric figures are traced with great beauty, variety and skill. Single buildings sometimes contain more than forty different patterns. One feature is the frequent use of tiles, which are arranged in patterns of different colours, and often give a fine effect to the minaret of some mosque.

Our illustrations show examples of Seljukian architecture in the ancient city of Sivas.

THE ARCHITECTURAL TREATMENT OF A GREAT UNIVERSITY.

THE architectural treatment of a great university is one of the most interesting and varied problems imaginable; and, by the natural conditions of change and growth, is a problem which is constantly presenting new phases, unforeseen combinations and unexpected possibilities. Each generation necessarily fails to meet the requirements of the next, and therefore unwittingly, with the best of intentions, places obstacles in the way of its successors which they in their turn, either from association or tradition, are loth to destroy, and which they try to utilise as best they may. There come therefore in the life of a university alternate periods of contented rest and of active change, as far as its buildings are concerned. The day of radical departures is postponed until they become inevitable, and are then undertaken with the haste of necessity. Oftentimes the architectural *ensemble* has gained in interest from the very diversity of the styles of different epochs, always provided these styles have intrinsic value in themselves.

"The universities of America," says the "Architectural Review" of Boston, Mass., "have been until recently comparatively poor in architectural merit, the University of Virginia alone being treated with distinct reference to effect as a whole. But within the last decade Columbia, Stanford, Princeton, the University of Pennsylvania, Washington University of St. Louis and California University have all received careful architectural study, both with reference to present needs and future growth. There are two very different styles of architecture adopted, one the monumental classic, formal in plan, vast in spaces; the other the more picturesque type, associated in our mind with the universities of England. Whatever differences there may be between these two types they agree in one particular, that is, that isolation of buildings is not productive of the best architectural effects. While the picturesque type has its masses bound together with walls and low buildings, the formal classic type attempts to arrive at similar results with pergolas, terraces, balustrades, &c. In fact, it is an open secret that the school study, the competitive plans and the first intention of most monumental classic schemes consists, on paper, more of accessories than of buildings themselves —accessories which are very apt to disappear under the stress of economy, as they have little or no claim to utility. On the other hand, the planning of the picturesque type is more compact, and its connecting units can be and are utilised.

"Apart from these considerations there is the element of material. The more highly organised architectural types, *i.e.*, styles of the perfected orders of architecture, demand the finest materials, otherwise they appear impoverished. There can be no rough work in connection with them. Each and every detail must be equally complete; and as a result it is the common fate of large classic *projets* to be pruned down to the most formal, dry and colourless results. This is not equally true of the picturesque type. It lends itself to changes, is adaptable to unexpected conditions, begins by demanding less and ends by giving more. A comparison between the écoles of France and the Scottish universities and the Halls of Oxford and Cambridge leaves little doubt as to which type is the more sympathetic with student life or with the later environment with the university Fellows. It is true that an academy in the ancient sense is imaginable, such a one as was to be formed at Syracuse, with its porticos, temples and halls, its stadium and theatre; but the elements of climate, of conditions of light, were those of a totally different character from the university of to-day; and, apart from this, the expenditure required to produce similar buildings to those in ancient Syracuse would be considered unjustifiable to-day, because the money could be used to better purpose in other directions.

"This preamble of general suggestion in regard to the two types, which are represented with us by the University of California and of Columbia and of Virginia on the one hand, and by those of St. Louis, Pennsylvania and Princeton on the other, is merely to explain certain remarks in regard to the present architectural activity at Harvard, the general schemes for the improvement of the College, and for bringing its buildings into harmony with each other as far as may be possible.

"Harvard was begun at a time when classic architecture was considered the only possible solution of any problem. We were essentially an English colony, and the architecture of the Georges was thoroughly established. It was as much a fashion as Victorian Gothic became later, and both these styles have this in common, that they were attempts, more or less successful, to imitate a fine architecture, of fine materials, a stone architecture of the Renaissance and the stone Gothic cathedrals, in poorer materials and with a minimum of detail. The impression of economy is only too evident in many cases. There appeared a series of buildings in brick and wood, which were not brick architecture nor wood architecture, but were an impoverished imitation of stone architecture. The classic forms were perpetuated, nothing more. When these buildings had simple walls with windows of good proportions, a cornice and a porch, they had the virtues of simplicity and scale, they adequately expressed the requirements and the possible expenditure of a small university in a young land. They set their seal upon Harvard, and it is now impossible to ignore them or to break away far from their suggestion, as is evidenced by Sever Hall and the Fogg Museum. Later there came a period of Victorian Gothic influence, in the 'seventies, when Weld and Matthews and Memorial Halls were built, and later still the Richardsonian touch in Sever Hall and the Law School. It is fairly conceded now that these departures were not successful, and their failure assisted the decision to return to the older Georgian type of Hollis, Holsworthy and University Hall. That type, however, is somewhat intractable. Its scale is small, both in masses and in openings. It ill brooks more than three storeys of height. It is best lying low and long, and any development means at once a reversion to classic courtyards, porches or porticos, terraces and balustrades. It is just on the border of the formally dignified.

"The original plan of the disposition of buildings at Harvard recognised this fact. They were placed around a large quadrangle, and there was evident intention to have a second quadrangle when the first was completed. But the buildings were isolated, and from that time to this all buildings at Harvard have been isolated, and the buildings outside the yard have been located with absolute disregard of mutual relationship. The problem of making these disconnected units into an organic whole is far from being a simple one, and several solutions have been offered. There is a unanimous opinion that some orderly arrangement of the buildings is necessary. The gates and wall around the grounds have gone far to give an impression of unity and seclusion, but the isolation of the buildings is still conspicuous. The integrity of the main quadrangle can be readily preserved. It would be a simple expedient to make low one-storey connecting links between Holworthy, Stoughton, Hollis and Harvard Halls, and a long arcade or colonnade at the back of University Hall, uniting Weld, University and Thayer Halls, and a similar colonnade in front of Grays, connecting Matthews, Grays and Weld. The second quadrangle, upon one side of which could be Sever Hall, was admirably suggested in Mr. Peabody's plan of some time ago; but this again could be united by connecting links of low buildings. Small quadrangles are by no means unattractive if the buildings about them are not too high, and a long low building from the south end of Thayer Hall to the north end of Sever Hall, with a corresponding mass back of the Library, would create a small quadrangle back of University Hall at right angles to the main quadrangle. In Jarvis and Holmes Fields, and in fact everywhere else in the University grounds, there are all sorts of possibilities; the only thing to be assumed is that order should be made out of the present chaos."

SELJUKIAN ARCHITECTURE IN THE CITY OF SIVAS, ASIA MINOR: THE GEOMETRICAL DECORATION.

ON ARCHITECTS.

By A COMMERCIAL TRAVELLER.

TEN years in architects' offices as pupil and assistant had taught me to look upon the commercial traveller as something very undesirable, a man to be got rid of as soon as possible, to be prevented at all hazards from penetrating into the inner sanctum of the principal. Of course there are individual exceptions, but I think it will be universally conceded that, generally speaking, the commercial traveller is not welcomed in an architect's office. There is perhaps, only too good reason why this is so, but in most cases commercial travellers have only themselves to blame if they are not treated with the courtesy that they desire.

But when one day I found myself in the position of the bagman—no longer inside the office but outside on the step seeking admittance from the very type of youth that once I myself had been—I saw the whole thing differently, or rather I felt the difference. Before, I may have sometimes had a mental sympathy for the traveller, but I don't think my feeling ever went beyond that. Now it was my duty to play the very part that before I had so often tried to spoil. But I am less concerned here with the troubles of the traveller than with the impressions that have been left on my mind, after two years of this life, concerning architects, and architects' assistants, and architects' offices.

If any architect is inclined to resent a traveller having "ideas" on the profession, I would ask him to remember that I was educated in the profession myself and that I have spent more years inside it than I have since spent on the road.

The remarks that follow will apply only to provincial architects, as my ground did not include the metropolis; but, outside London and certain other districts, I may claim to have been inside nearly all the architects' offices in England and Wales.

I commenced in the north, in a Yorkshire town. It was not many days before I was painfully aware that all architects who were not on the first floor of a building were either on the second or third. Rents, I suppose, are high—and so are architects' offices. Lifts are not yet universal, and even where you do find one you don't always find it working. Some sky-dwelling architects have speaking tubes from the entrance of the building up to their offices, which are no doubt a great convenience for clients but things to be avoided by commercial travellers. If you used them Mr. X. would invariably be out. In fact you soon come to learn, if you did not know it before, that you are not wanted. The office boy or the pupil you come to regard, after a short time, as a kind of natural enemy, a being standing between you and your victim. He, on the other hand, conceives it to be his duty to prevent you getting into that inner office which is the goal of your endeavours. The pupil, moreover, will not be slow to let you see that he is a professional man whilst you are only a "traveller." The airs that some of these youths assume would be amusing if at the time they were not so irritating. As a rule you receive far more courtesy from the principal than from the young gentlemen in the outer office. But these are small matters, and will be more or less familiar to all.

It was my duty to push the interests of a firm engaged in the production of a very high class of artistic work. I cannot, of course, state here the exact nature of that work. But it was of a quality that precluded its use in any but really good buildings. I soon found that my difficulties lay not so much with architects themselves as with the powers behind the architects—their clients. All over the country I have met with the same response: "Yes, we should very much like to be able to use such work, but we have no opportunity." And then would follow, in many cases, a recital of the trials of the architect wanting to do good work, but having to conform to the wishes of his clients in matters both of design and expense. It was not long before I had divided architects into three main classes. I find myself writing down in my diary, after little more than a month on the road, these words: "There are three types of architects: first, the good man who does good work; second, the little man who does filthy work; third, the good man who has to do poor work through lack of opportunity to do better. The first class you respect and possibly envy. The third class you pity, for theirs is a horrid position. The second class you despise; yet the second class resemble the first in this—their work gives them satisfaction, for it is the best they can do or can know. They may be happy in it. The third class can never be happy in their work, for they are always wanting to do something better."

These words were written merely to relieve my mind at the time, and some of the expressions are not such as one would put down deliberately. But there is always value in a red-hot impression, and after two years I find myself not very much altered in my views.

You can look at the matter from two entirely different aspects—from the point of view of the architect himself, or from the point of view of the public welfare. From the latter standpoint what I have called the "little men" (who really are not architects at all) are not far from being a real danger. Their existence justifies the agitation for registration. Yet it is difficult to see how registration would stop the evil. You could stop such men calling themselves architects, but you couldn't stop them drawing plans for willing clients.

But I am more concerned here with the personal aspect of the case. What inducement is there to young men to go into the profession when the chances of their ever getting any real satisfaction from their work are so small? Over and over again I have come across first-rate men doing violence to their natures in order to live. Men with high ideals, who recognise the influence of architecture in public life, and who wish to do their little towards raising the standard of taste, but who will go to their graves never having been allowed to put up a building in any way embodying their own ideas. When you begin to realise this thing, that it is the normal condition of a vast number of architects in this country, the situation of the profession strikes you as heart-breaking, and you feel glad to be outside it. And yet young men flock into these offices as pupils without any heed of the future!

Tragedy and comedy go side by side here as elsewhere. There are many tragedies in architects' offices. Young men with high hopes and aspirations, possessed of real ability, growing old as bald-headed assistants, or drawing plans of warehouses and shop-fronts in an office of their own. These things go on from day to day, whereas the comedies are things of a moment.

So the traveller finds out his ground. Many an office he passes by after the first visit. Many he will call at once or twice a year just to see if the luck has changed. The big offices he often finds doing more in quantity than in quality. And he not infrequently finds first-rate work proceeding from a dirty office up a dirty stair, the staff perhaps consisting of a pupil and an office boy.

If the traveller gets many snubs on the one hand, he also gets many confidences on the other. You must be prepared to talk to a man on his own ground as well as your own, and before this I have found myself discussing the character of James I. and the history of the French Revolution! Some architects will give you their no uncertain opinions of the work of their rivals. When half an hour afterwards, perhaps, you speak with the rival you hear another and quite a different tale. The temptation is to speak to one man of the weaknesses of another. You must, however, lock up all these things in your heart or, what is better, forget them. One architect in a large northern town told me that besides himself there were only two other firms in the same town that could design at all. I did not venture to ask the names of the other two, but I may say that this occurred in a town where the directories would yield a list of something like fifty or sixty architects' names.

Some architects will admiringly show you their own designs, inviting your praises. When you are able to give these honestly, well and good; but often you feel more inclined to criticise and suggest, and then your position is not happy. In fact, the poor traveller must ever be an actor and have no opinions of his own.

Architects will find all manner of excuses to express their inability to do business with you. But I am quite convinced that in the majority of cases the plea of lack of opportunity to do good work is a very legitimate one. Not once, but a score of times, has an architect shown me estimates that have been ruthlessly cut down, thereby doing away with anything but the very necessities of building. No man can have real interest in such work.

Up in the north I was always being met with the reply, "Yes, it is all very beautiful work, but we never get a chance of using it up here. You should go south; all the taste is in the south." Then I go south, and this is what I hear, "Yes, indeed, we should very much like to use such work, but we are too poor in the south; you should go north; all the money is in the north." And the worst of it is that both are right. The money is in the north and the taste is in the south, generally speaking, but it seems impossible that where the one is the other should be also. I have heard the most incredible stories of wealthy north-countrymen, men who will have the best of everything in their cellars, eliminating such items as plate glass from the estimates of their new residences so as to save expense.

The really good work is in the hands of a comparatively small number of men. And this should assuredly give pause to young men before entering the architectural profession as at present constituted. The big offices are not the best in many cases for a youth to pass his pupilage. In the majority of these offices things are managed in such a businesslike way, with so much regard for the division of labour, that a lad is apt to get into a groove from which, without he has a strong determination of his own, he will be unable to escape. These big offices are apt to give one a mental headache; you find yourself wondering what architecture is. Everything is done at high pressure, as in a factory, and you are not surprised when you are told by the architect himself, as I have been, that he could do with a month in gaol so as to be perfectly quiet and so regain his wits.

The President of the Institute in his address to students last February said: "There is nothing so prejudicial to artistic effort as worry. Therefore the architect whose soul is in his art should strive to render himself as impervious as possible to worry."

It is precisely this rush and worry that makes it impossible for so many men to design the fittings of a building themselves, and which has thrown them so much of late into the hands of the manufacturers. So much good work is turned out nowadays by manufacturers that it is no wonder that architects are content to choose from printed catalogues, or from samples, rather than to design anything themselves. In the case of door furniture and similar articles cost makes it almost a necessity in the majority of cases to adopt this course. But there are other things—take an ornamental iron gate or a leaded window, for instance—that have to be made specially to fit certain positions. These have to be designed, and there is no one who should know better than the architect what is wanted. But in more cases than I should like to name the architect does not know what he wants. He asks a manufacturer to send him a design, without, perhaps, being able to give him any real idea of the position or surroundings of the gate or window. He may give an indication of the "style" of the building or a traveller may be allowed to see the working drawings of the building. The traveller has to send on these particulars to his firm, who hand them over to their designer. This gentleman may be a real artist, but how is he to turn out really satisfactory work under such conditions? He is often working completely in the dark, besides which it is almost impossible that he should be in entire sympathy with all the styles that he is expected to design in. Who then is to blame if when the drawing goes to the architect he condemns the designs as unsuitable? Not the designer or the traveller, surely! It is the system which is to blame. It is a bad system, and involves an immense waste of energy and time. The usual course for an architect to adopt is to ask two or more firms to send drawings, and those he likes best or are cheapest he selects. Thus, to save the architect trouble and brains perhaps half a dozen firms are put to enormous expense in keeping drawing

SELJUKIAN ARCHITECTURE: A RUINED MOSQUE IN THE CITY OF SIVAS, ASIA MINOR.

offices with staffs of draughtsmen continually at work.

It is extraordinary to find how few architects have any idea of what they want in matters of this kind. They cannot tell you when you ask them, and they either cannot, or will not, sit down and think the matter out so that all firms can tender for the work on the same basis. No, it is a matter of simply knowing what they do not want; and you may take them a drawing which has taken hours, perhaps days, to produce and be met, not with a simple expression of disapproval, for which you must be prepared, but with an absolute inability on the part of the architect to say why he does not like it, or any capacity on his part to suggest where any amendment can be made.

I daresay manufacturers were quite as much to blame as architects in the first instance in making this system so easy. But I am not writing now from either the point of view of the manufacturer or the architect. I have no immediate interest with either. But there is the larger question of public taste, and it is impossible that the best results can be obtained in our buildings under the present system of architects relying on manufacturers for the designing of certain parts,

An architect is expected to do so much nowadays that he has very few hours of his time to devote to architecture. The profession does not lack in numbers and it does not want for recruits. But the right kind of recruits do not come. There should be room for all who have a natural ability for architecture, which at present there is not—room, I mean, to develop their gifts, not merely to exist. There should be no encouragement for those devoid of any natural ability to enter an architect's office. Parents and guardians should be made to understand that this is not a business that can be picked up in a year's time. The elements that make for success in the architect's profession are very various, and natural ability is only one of them. By itself it can do little. In many cases it lives as a Ghost, and the man who has had the advantages of money and social position goes to the top of the ladder. These things are too well known to need repeating. They are, however, impressed on the mind of a commercial traveller who before he trod the vestibules of so many architects' offices had worked behind the drawing-board in a few.

The Westminster County Court in St. Martin's Lane, W.C., is about to be removed from the site it has occupied almost since the date of the passing of the first County Courts Act. The Office of Works have approached the Westminster City Council with an enquiry as to whether any of the public offices which have come into their possession would be likely to be available. To that the General Purposes Committee have replied that the Westminster Town Hall in Caxton Street will be available after the completion of the alterations to the Town Hall in Charing Cross Road.

RECENT BUILDING IN MANCHESTER.

THOUGH it would be an exaggeration to say that Manchester is being rebuilt, an extraordinary amount of building is certainly going on—much of it of importance so far as size and cost go, much of it almost without any artistic value. In Winter's Buildings, on the east side of St. Ann's Churchyard, good use has been made by the architect of what is on the whole one of the best sites in the city for a building of the kind—shops (it is to be supposed) below and offices over them. Stone has been mainly used for the ground-floor work, and buff terra-cotta with a little red brick filling in the plain wall spaces above. On the west front the shops are treated with a series of arches, one to each shop, so that the superstructure stands upon something apparently able to carry it. On the north the architect would seem to have been prevented from carrying out the same idea, for here we have the aching void, and the great weight carried on nothing obvious, to which we are only too well accustomed. Lofty as the building is, it is somewhat overborne by the Conservative Club. Probably rights of light somewhat limited the height. The architectural treatment is at once dignified and picturesque, and there is a play of architectural form and treatment which avoids monotony and indicates true artistic feeling. Though the terra-cotta is of a uniform colour the tone is pleasant, and the treatment is such as not to beget a desire for more relief in colour than is obtained by the introduction of red brick for the plain wall surfaces. As the shields over the piers on the west are of stone, it is a pity that, if not all somewhat different in design, they were not at least alternated. The chimneys, which rise to a considerable height above the roof, give evidence of careful design. Their detail, however, is not nearly bold enough either for the building or for their own height from the ground. The windows in the roof are not equal in merit to most other parts of this really good design. In this situation the skyline is of specially great importance, but it does not seem to have received as much attention as it deserved.

Often, though not this year, there are to be seen in the Royal Academy excellent models of proposed buildings. By the use of such models, and at the cost at most of a few pounds, grievous blunders may be avoided which thousands of pounds would not wholly put right afterwards. Had such a model been made of the Whitworth Hall of the Owens College the upper part of the twin towers could hardly have been built as it is. This building is so good in general design and in fresh, vigorous, crisp and ingenious detail, that regret for this blemish is rendered all the deeper. Up to the springing of the fine south window the towers promised well. Then it is as if another hand, directed by some unlucky genius, continued the work. The idea of the finial to this gable would probably look better if employed in some other building. Had copper instead of lead been used for the covering of the spires the gain in effect would have been great to begin with; and then copper looks better as years go on. The carving of the arms has in places been given bolder relief. The improvement is so great that the sculptor should be encouraged to continue it.

St. Mary's Hospital, now nearing completion, fulfils its earlier promise as to outline, detail and colour. It exhibits very satisfactory terra-cotta colouring. The three or four dormer gables, south and east, are lumpy and awkward; here, too, a model would have assisted the architect to avoid this defect in a building which presents but few points for adverse criticism—and for some of these (for instance, the mean frontage to the canal) the architect is probably not responsible. Like those in most ancient buildings, the inscriptions and monograms are well designed, so as to say clearly what they have to say and yet to be effective as decorations. In the Technical Institute and Free Library in the Stretford Road the name and title appear in like manner in raised terra-cotta letters in the south front gable, but they are so ineffectively arranged and are in such slight relief that they do not tell their story clearly, and also fall short as a decoration. And yet the architectural merit of this building is not low. The treatment of it on the acute-angled site is so well devised that what may be in some hands a serious drawback here appears as a substantial advantage. The different purposes of the different parts of the building, too, are well expressed, whilst the whole presents due unity and harmony of design. There are some dormer gables of the same sort as at St. Mary's Hospital, but here the proportion is good; they do not seem too heavy or clumsy. This is a building of unrelieved red brick and terra-cotta—very red—and yet so handled as not to be offensively aggressive, words not too severe to be applied to the skeleton letters giving the names of firms and of their trades that disfigure the fronts of so many buildings. Look, for instance, round Albert Square. What an outrage on architecture are all these great ranges of letters which are placed over windows, on cornices, anywhere! Nothing is safe from the advertising demon.

One reason why there is so much building of a kind that makes one sorry for lost opportunities is that an inferior design usually looks much better on paper than in execution, whilst a design of real merit always looks much better in execution than as foreshadowed on paper. Few indeed of those who choose designs or employ architects have the qualifications necessary to enable them to distinguish between one and the other. It not infrequently happens that the inferior design, if the colour is laid on thickly or the lines made bold and telling, is preferred owing to the inexpertness of those who decide.

When we have our long-talked-of Chair of Architecture at the Owens College to instruct the public as well as architects we may do better all round. Not seldom the so-called architect provides little more than "the connection" and the money for conducting a practice. "Ghosts" are no more unknown in architecture than they are in literature or painting or sculpture; and thus the character of the work of a firm, instead of expressing the mind of the nominal architect, is apt to show from time to time sudden and violent changes, according to the "ghost" that may happen to be raised at the time.

Messrs. Goodall's great place in King Street is on the whole an effective building, and is obviously the work of a man who has knowledge and power behind his pencil. There is, however, the defect of the aching void—the heavy building "standing upon nothing." Nor can one help feeling that the special type of design here used is not the one most perfectly adapted to the special purpose, and that a severely plain building would have set off the furniture exhibited for sale better than this very pretty one.—(From the "Manchester Guardian.")

A Statue to General Dumas has just been finished, and will be erected in Place Malesherbes, Paris. The sculptor is Alphonse Moncel.

UNION STREET, ABERDEEN.

THE GRANITE CITY.

THE picturesqueness of the northern capital of Scotland, if the term may be used without offending the susceptibilities of Inverness, is second only to that of Edinburgh in this, that it affords several extremely interesting street vistas, the buildings of Aberdeen being various in form but singularly alike in their material. The accompanying photographs show the two best aspects of the city as seen from the central spot, which is undoubtedly the Palace Hotel of the Great North of Scotland Railway. Looking west, the thoroughfare known as Union Terrace is seen flanked on the right by the gardens, with the railway to the north in a deep cutting, and in the distance Schoolhill Bridge and various public buildings, among which the Library stands out prominently. Looking south from the angle of the hotel, Union Street, slightly rising away from the spectator, is a straight and solid street of buildings, best seen when the sun shines strongly upon the grey granite, but always pleasing, except perhaps on the winter mornings when powdered snow is driven along before a keen north wind, and then the prospect is bleak and depressing enough; but there is still evident the strong harmony between nature and the granite worked into architectural forms which must always strike the visitor. Our third illustration is taken from the top of the hotel, from which lofty vantage the whole city may be seen spread out at one's feet. The photographs were taken by Mr. F. J. Pape.

UNION TERRACE, ABERDEEN, FROM THE ROOF OF THE PALACE HOTEL.

Till 1800 Aberdeen had steep, narrow and crooked streets, but since the Improvement Act of that year the whole aspect of the place has been altered by the formation of Union Street (nearly a mile long and 70ft. wide) and King Street, and by the subsequent laying-out of many others, besides squares, terraces, &c. The city is built on sand, gravel and boulder clay, and the highest parts are from 90ft. to 170ft. above sea-level.

The chief building in Aberdeen is Marischal College or University Buildings, which stands on the site of a pre-Reformation Franciscan convent and was rebuilt during 1836 and 1841 at a cost of about £30,000. It forms three sides of a court which is 117ft. by 105ft. and has a tower 100ft. high.

STAINED-GLASS WINDOWS.

THE PROCESS OF MANUFACTURE.

WE take the liberty of reprinting the following article from the "Globe":—

Although everyone is familiar with stained-glass windows, the production of which is an art as old as ecclesiastical architecture itself, it is surprising how very few persons are acquainted with the process involved in the making of a stained-, or, to be more correct, a coloured-glass window. They look at a church window, note the figures, maybe of saints, depicted thereon, but rarely do they stop to enquire by what methods, either of the artist or the craftsman, this design in coloured glass has been effected. A brief account of the manufacture of a window may not, then, be lacking in interest, more particularly as few churches of any note fail to boast some examples, of very varying merit it is true, of the coloured-glass window.

Burne-Jones and William Morris.

In comparatively recent times a successful effort has been made to break away from the inartistic traditions which had grown up around this form of ecclesiastical decoration, and to revert to what is claimed to be the ancient, as it is certainly the better, practice of intimately associating the artist and the craftsman in the production of stained-glass windows. It is to the system of work as exemplified by the Burne-Jones and William Morris school that the following remarks particularly apply. As we have indicated, the window is more properly described as one of coloured glass, for it is on such glass that the artist paints—in monochrome it is true—his design, and the staining of the glass, if resorted to at all, plays but a very insignificant part in the decorative scheme.

The Most Important Part.

Perhaps one may be excused for describing the leading as the most important part of a stained-glass window, for the very good reason that without the leading it would be necessary to paint a window in one piece. It is the lead which renders it possible to make up a composition of any number of pieces of coloured glass, and thus gives the artist an almost unlimited range—there are certain reservations which need not be discussed here—in the production of his work of colour and design.

It is the lead, then, which gives strength to the picture both structurally and artistically; but in tracing a stained-glass window from its inception it should be stated that the artist first makes a small colour sketch to scale, and from this he produces a cartoon in black and white of the exact size of the window space to be filled. Here the contention that a knowledge of the craftsman side of the work helps so much in the production of appropriate design may be appreciated when it is stated that the cartoon is now given over to the workman, who produces what is called a "cut line" or tracing cloth; that is, he makes a tracing of the principal lines of the artist's picture, showing how the glass is to be cut to meet the needs of the colour scheme.

Glass.

Next it is the turn of the master glass-cutter, who, in association with the artist, chooses the glass to be used in reproducing his picture, and when the choice has been made—a by no means unimportant business, as can be well imagined considering the prominent part played by the coloured glass—the glazier's skill is brought to bear in cutting the glass according to the indications given by the tracing. Naturally the widest possible scope is offered in the choosing of the glass, and the firms engaged in the production of the material for windows are untiring in their efforts to produce the finest possible colours, from the most expensive form, that of gold-pink, down to the "sheet antique," as it is known. When a particularly fine colour is obtained the secret is carefully kept, and here again the artist and the craftsman work hand in hand in the attempt to produce the best possible result.

The glazier having completed his work, the pieces are put together in form on a sheet of plate glass placed over the cut line or tracing. Any portion of the coloured glass which has showing through it a principal part of the design, such as a head, a hand or a piece of drapery, has traced on it so much of the artist's work in the pigment—brown being the colour, made up of black, red and umber. The pieces of glass are so placed as to show between them the black lines of the tracing—the outlines of the figures, &c., and every part where different colours are to be arranged in juxtaposition—and it is where the black lines are revealed that the lead subsequently assumes its appointed position. Thus disposed in perfect scheme so far as colour is concerned, the "stained glass" is waxed into position on the slab of plate glass and then lifted on to an easel, where the task of painting is completed with all the care the artist can bestow on his work.

Sir Joshua's Windows.

It should be borne in mind that the painting is carried out solely in the monochrome already mentioned, and that it is the coloured glass showing through the brown pigment which produces such wonderful, and of course almost imperishable, effects. It was Sir Joshua Reynolds, if we remember rightly, who thought that brown pigment, tracing out the design over white glass, would alone suffice, and what result he obtained may be seen in a window in New College. It has been mentioned that coloured and not stained glass is the correct term to apply to the principal medium of "stained-glass" windows, and here it may be said that practically the only staining resorted to is in the production of gold colour. This is rendered possible by silver staining of white glass, a pretty effect very common nowadays in house decoration. It is really opalescent, but against the light a fine golden colour is shown.

With all the discoveries of modern times it is worth noting what little change has taken place in the production of coloured glass in this country, for the very good reason that the material to hand meets all possible requirements of the artist and the craftsman anxious to maintain the traditions of this beautiful form of ecclesiastical adornment. America has its own form of glass; and there is the Tiffany glass, with its wavy folds, which certainly renders possible certain effects otherwise unobtainable.

When the artist has finished his painting on the easel the pieces of glass are again separated and are fired in a kiln, being placed therein on iron trays. Heat having done its part in burning the pigment picture on to the glass the whole thing is waxed up again and retouching is resorted to, if necessary, with of course, in that event, refining. Finally comes the glazing with what are termed culms of lead—long strips, grooved on both sides, to carry the glass. All the joins are soldered, and when the window is placed in position iron bars from three-quarters to an inch in thickness are forced on to the mullion to support the picture, wire being soldered on to the lead, which holds all the portions of the colour scheme in position, and bound round the transversing iron. This, then, put in plain language, is the process involved in the production of a stained-glass window, such as the splendid "Jonah" window of Burne-Jones in Christ Church College Chapel, Oxford, the examples of the art of Mr. Lewis Davy in Stoke Pogis Church, or those which Mr. Christopher Wall is engaged upon in the lady chapel of Gloucester Cathedral. It is not in London that one expects to find the best examples of modern work, but mention may be made of the window of saints by Burne-Jones at Holy Trinity, Sloane Square, and of the work of Ford Madox Brown in the Chapel Royal, Savoy.

CARDIFF'S NEW MUSEUM.

THE site allocated by the corporation in Cathays Park, Cardiff, for the new National Museum of Wales consists of two acres lying between the new Town Hall and Park Place, so that the south facade of the new buildings will be in line with those of the Town Hall and the law courts.

The general plan of the proposed buildings was the subject of long consideration, and in the end the choice fell upon the so-called "gridiron" form, of which the British Museum of Natural History is a good example. The south range will form the chief front, and will contain the entrance-hall and main staircase, while stretching behind it will be a series of galleries crossing the space like the bars of a gridiron and ending in a north range. The art galleries will form the west front, while along the east will be certain semi-detached buildings, such as a lecture theatre, administrative rooms and porter's lodge.

A striking feature of the scheme will be the means adopted to accommodate the spaces to the collections. As the collections grow at irregular rates, it is impossible to anticipate the spaces they will require in even a few years. The result is that in most museums some rooms are under-filled and others are crowded. The remedy proposed is to avoid permanent rooms, and instead to divide the long galleries, which the "gridiron" form admirably supplies, into sections, which can be varied in length by movable wooden screens. These screens would each have a central arch, over which would be placed the designation of the section it opens into—Geology, Prehistoric, &c.—and would be so constructed as to allow them to be removed to another position with little trouble. It is not proposed, however, to apply the system to the art galleries and the natural history index-hall, as the requirements of their collections differ considerably from those of the ordinary galleries. Stone is the material proposed to be used, in order that the exterior should harmonise with the new Town Hall.

In addition to the £6,000 generously promised by the executors of the late Mr. J. Pyke Thompson, J.P., it is proposed to raise a loan of £14,000 on the security of the museum rate, and repayable in thirty years. Money for building purposes must come from somewhere, but the total of £20,000 is far from being sufficient. The new Victoria Art Gallery of Bath has cost £16,000, but it is obvious that for the combined purposes of museum and art gallery at Cardiff a building three times its size will be required. Bristol contemplates expending about £30,000 on an extension merely of the existing museum. £15,000 is the estimated cost of the first portions to be erected of the proposed museum and art gallery of Plymouth—a town half the size of Cardiff. At Preston the library and art gallery cost over £100,000, representing, say, £50,000 for the latter. The new Kelvingrove Gallery at Glasgow has already absorbed a quarter of a million. Yet these towns have only aspirations on a municipal plane, whereas Cardiff is looking for its recognition as the capital of a nation, and for its museum and art gallery to become a national institution. Will Cardiff sit down content with a second-rate municipal museum?

ABERDEEN FROM THE ROOF OF THE PALACE HOTEL.

AN EXPERIMENT IN HOUSING.

THE DUKE OF NORTHUMBERLAND'S experiment in working men's dwellings at Alnwick is made much clearer by a memorandum which, with the permission of the Duke, has been written for the Charity Organisation Society. It is by Mr. E. G. Wheler, who has been prominently connected with the movement from its start. It is one of the features of the system that it is based on sound commercial principles. Efforts of any other kind, however well intended, must be spasmodic and local, and therefore cannot be looked upon as a solution of the question. Mr. Wheler points out that one of the chief difficulties to be contended with is the present high price of labour. To this he adds the unfortunate standard of morality adopted by the men's unions that, no matter what wages are paid, the output of work must be restricted. By this means the present scarcity of labour becomes an additional and to a great extent unnecessary obstruction to the betterment of the condition of the men themselves. The Duke of Northumberland stipulated in connection with his scheme that the houses should be inhabited by bonâ-fide working men and women, who might at their option purchase their houses by instalments. As the financial basis of his scheme his Grace adopted the Government rate of interest for the repayment of public loans at 3 per cent. interest in thirty years, viz., £5 2s. 0½d. per cent. It was his special object that the scheme should be financially sound, and that philanthropy should go no further than providing the capital required and the voluntary services of an honorary committee who kindly undertook to give effect to his proposals. For his assistance the Duke appointed a committee, which has strictly maintained the economy of the working of the scheme. Among the members are a bank manager, who acts as treasurer, the clerk of the works at Alnwick Castle, who supervises and advises on all matters of construction and repairs, and a working man well acquainted with the views and wants of those for whom the houses are erected. No one is paid excepting the salaried manager and the collector of rents. A piece of flat land containing 5,820 sq. yds., and sufficient for the erection of thirty-one houses with the necessary out-offices, yards and streets, was placed at the disposal of the committee at the price of 2s. a yd., or £484 an acre. This price was considerably below its market value. The land was within five minutes' walk of Alnwick railway station, and therefore well in the centre of a town of 7,000 inhabitants.

It was proposed by his Grace to lay out the main streets in gardens with a footpath down the centre. This, however, could not be agreed to by the town authorities, as it was contrary to their by-laws. Had this plan been adopted, it is estimated that some saving would have been effected in the cost of each house, and that, whilst the same air-space would have been secured, a much prettier effect would have been produced as regards the appearance of the houses. As already indicated, the occupier can purchase his house in thirty years. In the case of the houses of which the purchase-money is £360 each the quarterly instalment is £3. It is specially provided that at the end of any year the occupier may purchase his house by the payment of a lump sum, and a full table of such payments due at the end of any one of the thirty years is placed on the back of the contract for sale. In the case of the houses valued at £345 each the quarterly instalment is £2 17s. 6d,

Engineering Notes.

The Primitive Methodist Church and Schools, Gloucester, are being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet tubes, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Mr. John Colville, M.P., died last week at Motherwell from a severe attack of British cholera. Mr. Colville was born in Glasgow in 1852, and was educated at Hamilton and Gartsherrie Academies. He was an iron and steel manufacturer in business at Motherwell, where he was head of the firm of David Colville & Co.

A New Scottish Harbour.—The Lords Commissioners of the Treasury have agreed to grant £15,000 towards the sum required for the construction of a harbour at Craigenroan. The scheme entails the incorporation of Portessie and district by the burgh of Buckie. The estimated figures submitted embrace a total cost of £45,000, of which sum £10,000 is in hand, exclusive of the Treasury grant. A public meeting of the inhabitants will probably be held to deal with the scheme.

"Electrifying" the Underground.—Mr. Perks, M.P., who has succeeded Mr. J. Staats Forbes as the chairman of the Metropolitan District Railway Co., has stated in an interview with a representative of the Press that the change from steam to electrical traction is progressing steadily, and will be completed in about two years' time. He does not agree with Mr. Forbes that Mr. Yerkes will be satisfied that the Ganz system is preferable to the ordinary system used on the great American lines and on the Central London. It will of course be the duty of the tribunal appointed under the recent District Act to advise the Board of Trade which system is more suitable in the interests of the public, and having regard to the safety of passengers and employées. Mr. Yerkes, it is added, will give orders as far as possible for railway stock to British makers, if their prices compare favourably with those of the American makers and they can turn out the material in as short a time.

A New Bridge over the Swale.—According to information from Sittingbourne, the South Eastern and Chatham Railway Co. have made fresh proposals in reference to a new bridge over the Swale. They stated that they would undertake to go to Parliament next session with a proposal for a swing-bridge, provided among other things that the conservators would agree not to require any alteration in their existing powers as regards the opening of the bridge only for vessels that could not lower their masts. The conservators replied that they could not consent unless the bridge was to be opened to all vessels, whether having fixed masts or not. The company having demurred to this, the Milton Creek Conservators have, it is said, decided to commence an action to secure the opening of the existing bridge, which has been closed to vessels with fixed masts for the past two years. The Admiralty also, it is understood, think that the bridge should be restored as an opening one, both in the interests of H.M. Navy and in respect of ordinary commercial traffic.

Memorial to the late Peter von Tunner.—It has been decided to erect in Leoben, Austria, a statue of Peter Ritter von Tunner, Bessemer Gold Medallist of the Iron and Steel Institute, to commemorate his great services to the Metallurgy of Iron. An influential committee has been formed, with Mr. Ignaz Prandstetter (Leoben) as president, Professor J. G. von Ehrenwerth (Leoben) as vice-president, and Professor Carl Fritz (Leoben) as hon. secretary, to collect subscriptions. The committee includes the following members of the Iron and Steel Institute: R. Akerman (Stockholm), Bessemer Medallist; Sir Lowthian Bell, Bart. (Middlesbrough), past-president and Bessemer Medallist; A. Greiner (Seraing), member of council; Professor H. M. Howe (New York), Bessemer Medallist; C. Lueg (Düsseldorf), president of the society of German Ironmasters; Josef Massenez (Wiesbaden); E. Schrödter (Düsseldorf), and Professor H. Wedding (Berlin), Bessemer Medallist. At a recent meeting of council of the Iron and Steel Institute the matter was considered. As a contribution to the memorial could not be voted from the funds of the Institute, the members of council present decided to contribute two guineas each; and Mr. Bennett H. Brough, the secretary, now informs us that he has forwarded to the committee in Leoben contributions of that amount from Mr. William Whitwell (president), Sir David Dale, Bart., Sir Lowthian Bell, Bart., The Right Hon. Sir Bernhard Samuelson, Bart., Sir James Kitson, Bart, Sir Frederick Abel, Bart., Sir Benjamin Hingley, Bart, Mr. R. A. Hadfield, Mr. J. T. Smith, Mr. A. T. Tannett-Walker, Mr. J. E. Stead, Mr. William Evans, Mr. J. D. Ellis, Mr. Arthur Cooper, Mr. Arthur Keen, Mr. George Ainsworth, Mr. F. W. Webb, Mr. E. P. Martin, Mr. P. C. Gilchrist, Mr. Andrew Carnegie, Mr. William Beardmore, Mr. S. R. Platt, Mr. J. M. While, Mr. W. H. Bleckly, Mr. James Riley and Mr. David Evans. Peter von Tunner died on June 8th, 1897, and particulars of his career are given in an obituary notice published in the Journal of the Iron and Steel Institute, 1897, No. 1, page 314.

Builders' Notes.

Welbeck Abbey.—The contract for rebuilding the Oxford wing of Welbeck Abbey, which was destroyed by fire, has been let to Messrs. Trollope & Co., London. About 250 men will be employed for two years.

The Leeds Master Builders' Association held its annual meeting last week when Mr. John Pickard was elected president for the ensuing year; Mr. G. Wilson, vice-president; Mr. W. C. Ellisdon, secretary; and Messrs. J. T. Wright, W. H. Dews, W. Airey, C. Myers, W. Simpkiss, W. Oakes and G. W. Nettleton, committee.

Partnership Dissolved.—The partnership heretofore subsisting between Messrs. Samuel Mason & Arthur Waddington, carrying on business as builders and contractors at Glass Houghton and Castleford, York, under the style or firm of Mason & Waddington, has been dissolved by mutual consent as and from the 13th August, 1901. All debts due to and owing by the late firm will be received and paid by Mr. Samuel Mason.

Mr. James Cowle, builder of Douglas, died last Wednesday at the age of sixty-two years. He was in a large way of business, and held the positions of Government valuer, surveyor of ecclesiastical buildings, and surveyor of Government buildings. Many public buildings in the island were designed and erected by him, these including the Tynwald Court Chamber at Douglas, the Poor Asylum, the Rolls Office, and the Douglas Railway Station. The deceased was a native of Liverpool.

Fire at Builders' Workshops.—A serious outbreak of fire occurred last Friday morning at the extensive premises of Messrs. Holloway Bros., builders and contractors, Garfield Road, New Wandsworth. The premises first attacked were partly surrounded by a wall about 7ft. high, beyond which were private residences. The flames quickly cleared the slight obstacle, and set the upper part of the roofs of the houses on fire. Water was pumped on to the houses, and the flames extinguished, but the houses were much damaged by fire and water. The fire was at length got under. A range of buildings of one and two floors, covering an area of 140ft. and 100ft., used as saw-mills, workshops, offices and stores, was completely burned out, and the stock of timber in the yards was severely damaged. In addition, several houses have been partially destroyed. The loss as regards Messrs. Holloway is covered by insurance.

Building Extensions in North Cornwall.—In the development of North Cornwall as a resort for tourists, Port Gaverne, at present but little known, bids fair sooner or later to come into enviable prominence. Already by the rapid erection of good class houses in almost unbroken succession on the connecting road, it has stretched westwards on to Port Isaac. And now schemes are afloat for its expansion in an easterly direction by the fine cliffs overlooking Tintagel, and southwards on each side of the snug and beautiful valley ending at Pendoggett. The estate agents of Viscount Ebrington, who owns a large quantity of land in and around Port Gaverne, have marked out a considerable amount of the ground for building enterprise. The water supply from the high lands of Treore (one of the Viscount's estates a mile or so distant) promises to be all-sufficient; and the construction of the reservoir with the laying of the pipes is being pushed on. An analysis of the water has proved it to be excellent.

Rebuilding of Parkhurst Barracks.—The third contract in connection with the rebuilding of the Albany Barracks, Parkhurst, has just been accepted, Mr. H. I. Sanders, Government contractor, of Southampton, who has carried out many contracts in the island, being the successful tenderer. The work included in the new contract comprises the erection of commanding officer's residence, officers' quarters, quarter-master-sergeant's quarters and drill sheds, and these buildings will occupy the space now being cleared, between the highway and the new buildings nearing completion, on the guard-room side of the main entrance to the barracks. The commanding officer's residence will front the highway, and then will come the officers' quarters and other buildings; and the new buildings, of modern style, will be in striking contrast to the old rabbet tiled hutches which they will supplant. Even after the completion of this contract the central range of the old-fashioned barrack buildings will remain to be removed. The amount of this contract is nearly £20,000. Messrs. Armitage & Hodgson have nearly completed their work under the last contract. In addition to four large barrack blocks, corresponding to those on the upper part of the parade ground, they have erected a school and a considerable amount of shedding, &c.

Coins under Memorial Stones: Singular Thefts.—Details of two robberies surrounded by somewhat singular circumstances have just come to light in Bury. Amongst the schemes which the Bury Corporation have on hand at the present time is the erection of public abattoirs on the fair ground and of fever isolation hospitals at Elton, and the contractor for both sets of buildings is Mr. John Tinline. Recently memorial stones were laid in connection with the administrative block and the scarlet fever pavilion of the isolation hospital and in cavities underneath the stones there were placed bottles containing various documents and a number of coins of the realm. When work was resumed at the hospitals after the recent Bury holidays it was found that nearly all the bricks behind the memorial stone of the administrative block had been knocked away and the bottle abstracted and rifled of its contents. The papers were strewn about, but the money had been taken away. The memorial stone of the scarlet fever pavilion was not supported by bricks at the back, but was firmly cemented in position. The depredator or depredators, however, by using an iron crowbar removed the stone from its position and treated the contents of the bottle underneath in the same way as he or they had treated the other. About the same time the contractor's office and the clerk of the work's office in connection with the abattoirs were broken into, but nothing of value was taken away. Both affairs are now being investigated by the police.

Bricks and Mortar.

APHORISM FOR THE WEEK.

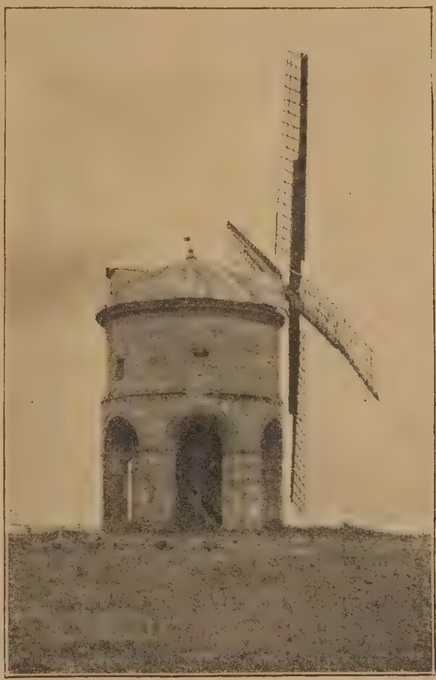
Better the rudest work that tells a story or records a fact, than the richest without meaning.—RUSKIN : "Lamp of Memory."

Our Plates. PARTICULARS of Magdalen College School, Wainfleet, Lincolnshire, will be found on page 31 of this issue.—Vienna proper, or the inner city, was formerly separated from the other districts by a circle of fortifications, consisting of a rampart, fosse and glacis. These were removed in 1858-60 and the place of the glacis has been taken by the Ring-Strasse, a handsome boulevard two miles long and of an average width of 150ft. Most of the important new buildings are found in or adjoining the Ring-Strasse, amongst them being the monument to the Empress Maria Thérésa and the imperial museums of art and natural history, two extensive Renaissance edifices designed by Semper, and matching one another in every particular. Adjoining the museums to the west are the Palace of Justice (1851) and the Houses of Parliament (1883), and beyond these the immense new Rathhaus (1873-83), the last designed by Friedrich Schmidt, who may be described as the chief exponent of Gothic as Hansen and Semper are the leaders of Classic and Renaissance architecture in that country.

Dr. Stein's Discoveries in India. WITH a view of conducting excavations which would settle the date and the origin of the ruins found buried in the sands of the Taklamakan Desert about Khotan, and the doubts as to the scripts which had been obtained there, Dr. M. A. Stein, of the Indian Education Service, applied in 1898 to the Indian Government for assistance towards exploring these sites. That Government readily agreeing to Dr. Stein's proposal, placed him on a year's special duty. In June, 1900, he set out. Weeks were spent in preliminary work, Dr. Stein employing his time in surveying the mountain range south of Khotan. Winter put an end to the work in the mountains, and he then turned his attention to the ancient sites and excavated a large series of Buddhist temples about ten miles to the north-east of Khotan. The finds comprised ancient manuscript in Sanskrit, Chinese and an unknown language, the last, however, being written in well-known Indian characters; Buddhist pictures on wooden boards, and stucco sculptures of Indian style. The site is known as Dandan-Vilik. From there Dr. Stein went to the Keryia district, where rich results attended the excavations. Amongst ruined dwellings was an abundant supply of epigraphical and other relics, and 500 documents written on wooden tablets in the Kharosthi script. Some of the latter bear the clay seal originally attached to them, and these show unmistakable traces of Greek art. After completing his excavations Dr. Stein marched back to Kashgar and arranged for the transport of the collection to England. The Doctor has now found a safe resting-place for his antiquities in the British Museum, where he is arranging them.

Chesterton Windmill, Warwickshire. FEW architects of the present day have the opportunity to design a windmill, and what the genius of Inigo Jones has erected comes as a very interesting architectural curiosity. Chesterton windmill is between six and seven miles from Warwick, east of the main Banbury road, and stands out prominently on its grassy hill. It bears the date 1632, and was erected at the expense of Sir Edward Peyto on the site of an earlier structure. Built of ashlar and circular in shape, the body is supported by six square circular-headed pillars with pilaster caps, the ascent to the interior being made by a wooden latter underneath. The domed roof is lead-covered, and revolves to suit the fliers' direction, according to the way of the wind; there are several windows in the upper half and one dormer in the roof. This windmill is said to have served as a model for one erected at Rhode Island in 1676. The remains of a Roman camp lie half a mile west, where Roman coins and pottery have been discovered. A magnificent prospect of "leafy Warwickshire" is obtained from the windmill—the castle at Warwick and tower of St. Mary's Church, the spires of Coventry, and on a clear day the suburbs of smoky Birmingham. This mill was worked until recently; a good view of it is seen from the Great Western railway soon after passing Harbury station. The accompanying photograph was taken by Mr. C. M. C. Armstrong.

A Discovery near Savernake Forest. A DISCOVERY of flint implements of much interest has lately been made on the estate of the Marquis of Ailesbury at Knowle Farm, on the borders of Savernake Forest. A gravel pit was opened a short time ago close to the farm buildings, and the implements have been found in this at various depths below the surface of the ground, some embedded in coarse gravel and silt, and others in dark red clay, and at a depth in some instances of 8ft. to 10ft. from the surface. The ground is at least 450ft. above sea-level, and it would seem that at the particular place where the gravel occurs two or three streams must have met which had had their courses through the forest and were making their way to the valley of the Kennet, some three or four miles to the south-east. There is now no stream of water in any part of the forest, and besides this there is nothing to indicate in the present configuration of the ground the source from whence the water by means of which the valleys were eroded could have come. It is only by imagining an entirely different face to the country (such as might have been if the valleys had been eroded before the formation of the Pewsey Valley, some three to four miles to the south-west) that we can conceive an origin for the streams in these forest valleys. Between 200 and 300 implements have already been found, many of them of beautiful workmanship, while others are very rude and apparently unfinished. Whether these latter belong to the earlier "Eolithic" period and have been washed out of their earlier beds of gravel and deposited with implements of a later date (as appears to have taken place on the plateaux in Kent) is a point to be decided hereafter; but it is very difficult to imagine these rude implements to have been manufactured by the same race of people as have made and finished with so much care those apparently lying by their side. Most of the implements are of very superior flint, extremely hard in texture; one or two may be of chert, and one appears to be of "Sarsen" stone, and they bear a marked similitude to those found at St. Acheul in the valley of the Somme. Some are very finely polished, as if from the constant rubbing of blown sand, and have an appearance as if coated with glass. They are of all sizes and shapes, some of 5in. to 6in. long, generally of a rough unfinished type; others 3in. to 4in. long, of the common spear-shaped form; others of the well-known ovoid form; and others pointed as if to be used as drills. One or two Palæolithic implements have been previously found in the locality; but the occurrence of them in such large numbers as these at Knowle is quite new to the district. No other remains have as yet been found; but considerable interest attaches to the working of these gravel pits, which will probably remain open for some time.



WINDMILL AT CHESTERTON, WARWICKSHIRE. INIGO JONES, ARCHITECT.

Extending a Building Line. A CASE recently arose which forms a typical example of the great need there is for local authorities to be given the power of supervision of the design of buildings and over advertisements in order to prevent the depreciation, wilful or otherwise, of neighbouring property. A petition signed by several residents in Upper Teddington Road, Hampton Wick, was recently received by the district council in respect of new buildings in course of erection on the other side of the road, the memorialists calling attention to the fact that when they last addressed the council on the subject there was some tacit understanding that the former frontage line of the buildings opposite their properties would be kept, but they found that the frontage line had now been infringed and that the houses being built were much nearer the road. They were of opinion that if the council passed the plans they ought to have had proper notice of it, so that they might have been heard on the subject and opposed it if necessary. In addition they found that the fence opposite them was plastered with advertisements and the space between the houses and the road was kept for storing timber, &c., which was a great annoyance to them and a great detriment to the value of the property in the neighbourhood. They therefore asked the council's assistance to have the advertisements removed, and that the council would give them notice if any further buildings were to be erected. The committee recommended the clerk be instructed to reply, pointing out that the council had secured after a great deal of trouble a frontage line of from 12ft. to 20ft., which was the utmost the law allowed. As regards the advertising and timber being stored, the council had no power to interfere, but had directed the clerk to communicate with the owners of the property asking them to discontinue the use of the fence for advertising purposes. As to the passage at the rear of the houses the committee advised the clerk to communicate with the owner of the premises and request that the passages be closed as not being in compliance with the by-laws. It was also stated that the council went out of their way to prevent the erection of the buildings spoken of, and they tried to get the building line kept to 40 feet, but found they had no power to enforce that. The recommendations of the committee were adopted.

New York and London. MISS ELIZABETH L. BANKS in "Cassell's Magazine" draws some points of similarity and difference between London and New York. There are probably, she says, no two cities in the world which are at the same time so like and so unlike as are New York and London. Regarding the points of similarity, the writer couples Wall Street with Lombard Street, Park Row with Fleet Street, the City Hall with the Mansion House, and so on. It will, however, be noticed that the imagination to move in this direction must be strongly encouraged by the similarity of the business carried on in these particular quarters of London and New York. Although Wall Street of New York is compared with Lombard Street, it is perhaps only in its architectural character that the similarity is observable, for as a business comparison Threadneedle Street would certainly take precedence. The Fleet Street of New York is Park Row, or Newspaper Row. From an architectural point of view the comparison is entirely misleading, but from the fact that the business carried on in both thoroughfares is the same, the likeness is easily established. The knowledge that the Mayor of New York works at the City Hall would naturally recall the Mansion House to the Londoner. As an interesting fact, it is noted that business in New York commences at a much earlier hour in the morning than in London.

Persian Carpets. The British Consul at Azerbaijan, in Turkey, says it is a most interesting sight at that town to see the carpet looms at work. Eight or nine boys, whose ages range from eight to twelve, sit in serried rows at the looms, and armed with the wool, which they pull from reels suspended above them in their left hands, and a flat knife, crooked at the point, in their right, dash, with three movements, the thread through the web-strings, hook it into the desired knot, and cut off the surplus ends, starting another knot before the spectator has realised what has been done. Having been shown the design and colouringof the carpet they are to work for the first two or three feet, these boys rely on their memories for the remainder of their task, for on only two or three looms is the design of the carpet to be seen affixed, and then only its plain pencilled drawing. When nearing complicated parts or medallions, a boy aged from twelve to fourteen, the foreman of the loom, who has the design seemingly imprinted in his mind, walks up and down calling out in a quaint sing-song manner the number of stitches and the colours of the thread to be used. A copy of the famous carpet from the Mosque of Ardabil, which is now at the South Kensington Museum, is being made by one firm. The design, flowering and colouring of the original are said to be unique, and here, although the boys were working without the design and at the rate of from 30 to 35 stitches a minute, a careful comparison of the hand-painted copy of the original showed the most minute attention in every detail. Nothing but hand-work is employed in the manufacture of Persian carpets and rugs, and none but natural or vegetable dyes are used, and it is to this latter fact that Persian carpets and rugs are supposed to owe their reputation and lasting colours, although it is said that the secret of the beautiful dark blue dye used in the older days has been lost.

Bad Public Taste. The "Morning Post" recently published the following clear and true statement with regard to the bad taste so general among the English public :—"Despite the fact that we in England are now paying great attention to art education, artistic taste is spreading at an astonishingly slow rate. The great mass of the people does not yet believe in the humanising influence of art, nor in its compatibility with comfort. The general public's idea of art is something garish or clumsy or gimcrack. The rooms are packed with articles of infinite variety ; there is no repose, everything tries to get in front of its neighbour ; there is no harmony, neither in colour nor in form. Space, freedom to move about a room, has no charm for most folks. They do not feel the beauty of artistic simplicity. With them there is no compromise between utility and beauty. And this lack of taste is unfortunately spreading to the country districts, where in days gone by one generally found a sense of order inside most houses, a simple scheme of decoration, furniture at once comfortable and charming to the eye. For instance, in one of the oldest and most picturesque villages in Buckinghamshire there is an old inn recently furnished with as garish and ugly furniture as Tottenham Court Road ever produced. Coming from the artistic breadth of the village green and the quaint simplicity of the cottages, those chairs, sofas, &c., have other than a pleasant effect on the nerves."

"L'Art Nouveau" Again. It has been the endeavour of several persons recently to foist the responsibility of starting the "art nouveau" movement on to the promoters of the "arts and crafts" movement, chief of whom have been Mr. William Morris and Mr. Walter Crane. A correspondent of the "Times" comes to the defence. He says : "We need not dim the reputation of these artists by ascribing the 'art nouveau' to them even remotely. It is the result of the example of a very different kind of artist. Those who went to see the Japanese troupe lately performing in London will remember that fully half the popularity of the entertainment was due to the dancing of Loie Fuller. This artist has for years been more widely known on the Continent than in this country. It is to the Continent undoubtedly that we owe the 'art nouveau,' and the idea sprang from the forms produced by the gyrations which Loie Fuller imparts to her garments as she twirls them in the lime-light. Anyone can verify the connection between the 'art noveau' of the Louie Fuller performance by going to see them. The Victoria Museum possesses ample specimens of the hitherto recognised styles of art, 'Jacobean,' 'Louis XIV.,' 'XV.,' and 'XVI.,' &c. I think that those who have some taste in art will feel that it was quite unnecessary to add specimens of the 'Loie Fuller style.' "

New Patents.

These patents are open to opposition until September 31st.

1900. — Timber Transporter. — 14,594. E. J. Cullis, 2, Midland Road, Gloucester, and A. Cullis, Woodville, Belgrave Road, Gloucester. The timber is placed by hand on inclined dogged chains, by which it is raised to an overhead platform, where its direction may be changed as desired. Delivery is effected at any point by switching the timber on to other dogged chains, or on to slides or rolls.

Door Stops.—14,820. F. J. J. Gibbons, St. John's Works, Church Lane, Wolverhampton. The object of this invention is to produce an adjustable dust-proof doorstop. It consists of a circular metal box (which is let into the floor or ceiling) having a screw-threaded sleeve which holds in place a dome-shaped stop pressed outwards by a spiral spring. The extent to which the stop projects can be varied by screwing the sleeve.

Glass Waste Bricks. — 17,120. W. W. Pilkington, The Hazles, Prescot, and W. R. Ormandy, 142, Windleshaw Road, St. Helens. Bricks for low temperatures such as flue linings are made of 80–90 parts of waste glassworks sand, 20-10 parts of common field sand, and 5 parts of alkaline silicate solution. Where waste glassworks sand cannot be obtained coarse-ground and finely-ground refractory rock is used. For use with the bricks a cement is employed having practically the same composition. The bricks are pressed and burnt.

The following specifications were published on Saturday last, and are open to opposition until October 8th. A summary of the more important of them will be given next week. The names in italics are those of communicators of inventions.

1900. — 10,093, Meldrum & Meldrum Brothers, Ltd., destructor furnaces. 11,666, Fischer, instrument for setting-out circular curves. 13,602, Schudt, plastic decorations. 13,640, Denny, pantographic apparatus for producing copies of sculptures, carvings, &c. 13,711, Marten, refuse destructors. 13,923, Charlton, heat radiators. 14,083, Wilkinson, brick- and tile-making machines. 14,341, McCaul, cowls for chimneys. 14,847, Turner, fireproof flooring and roofing. 15,932, Mouchel, concrete piles. 15,966, Kowalsky, apparatus for testing gas-pipes. 16,330, Moseley, warming and ventilating apparatus for use with stoves, fireplaces, &c. 16,860, Jagger, apparatus for placing driving straps on their pulleys. 16,866, Simpson, swinging doors. 17,005, Ewing, stoppers for earthenware pipes and junctions. 17,338, Evans, self-flushing closets. 17,448, Brodie, wood paving blocks. 17,513, Provand, disinfecting appliances. 17,556, Hutchison, baths. 18,459, Alves, firegrates. 18,625, Long, vices.

1901.—2,412, Sutton, joint for metallic and earthenware pipes. 6,364, Falk (*Hildebrandt*), incandescent gas-burners. 7,000, MacCallum, domestic fireplaces for the prevention of smoke. 8,465, Ray, sash cords. 9,141, Innes, lavatory stands or basin frames. 9,222, Fischer, incandescent gas-burners. 9,552, Cooley, metal expanding channels for wood paving and wood-block floors. 9,923, Jackson & W. W. Whitehead Co., pipe wrenches. 10,726, Weber & Schön, appliances for adjusting windows or casements. 12,521, Law, gas-burners for use with incandescent mantles. 12,537, Hoshor & Platt, hoisting booms. 12,625, Hills & Southard, door checks. 13,282, Moessner, roller-blinds. 13,391, Höybÿe, Lyngbye & Thalbitzer, door locks. 13,401, Sutton, fans for ventilating ice safes. 13,556, Baxter, apparatus for breaking stone or bricks.

NEW SAVINGS BANK, NORWICH.

New premises have been erected in Red Lion Street, Norwich, for the Norfolk and Norwich Savings Bank. The elevation to the street is of white stone. Messrs. G. J. & F. W. Skipper are the architects, their design having been accepted in a competition restricted to the architects of the city and county. The architectural style adopted is that of the English Renaissance, freely treated and adapted to modern bank buildings. A feature of the exterior are the large plate-glass windows on the ground floor, and the plain plinth, heavily rusticated doorways and massive granite columns. On the first floor—where the boardroom is —the windows at either end are designed with rusticated columns and pedimented entablatures. The intervening space is divided by pilasters running up through two floors and capped with Ionic capitals, and the bays between these pilasters are filled with arched window openings, surmounted by carved swags of flowers and fruits suspended from lions' heads, giving a connecting idea at this level and a richness to the whole facade, especially as above these the second floor windows have their simplicity broken up by an ornamental stone baluster-mullion. A strongly marked entablature runs along the whole of this portion of the front carrying a solid stone parapet. At either end this entablature is stopped and the cornice alone continued through, which increases the wall surface and presents a greater solidity of treatment at each end, so as to give support and also a foil to the richness of the other part of the work. Over the main entrance the pediment is broken and carried up in curved lines, and a panel having the Arms of the City carved upon it is introduced. The whole is surmounted by three curved urn-shaped terminals. The other end has a segmental pediment with a simpler treatment above it. The vestibule to the bank has a curved inner stone wall pierced for a window and divided by stone columns, and filled with coloured lead glazing to light the secretary's room. From this vestibule, through glazed swing-doors, the banking hall is reached. This room is 33ft. 6in. long, 25ft. 6in. wide and 16ft. high. The walls are lined with marble to about two-thirds of their height, and the windows and doors are arched over with the same material. The skirting and the impost or cornice moulding are of a veined black marble called Bleu Belge ; the pilasters are of a rich yellow-veined marble called Imperial Pavonazzo ; the filling space between the pilasters is of a veined cream-grey marble called Piastraccia ; and the arches and keystones over the doors and windows are of the green marble Vert des Alpes. The glazing in the front windows is of plate glass, whilst that of the arched windows at the rear is of lead glazing in a floral pattern. The ceiling is coffered and the spandrels between the arches, &c., are occupied with consoles of a decorative character. The counter and the other woodwork fittings, which still remain to be completed, will be of mahogany. They are the work of Messrs. Chamberlin, Sons & Co. A prominent feature is the marble fireplace at the west end of the banking hall, where provision is also made for the clerks' entrance and for the main staircase to the boardroom and upper parts of the premises. The light is supplied by pendant electric lamps suspended from the ceiling, artistically executed in copper and brass, hand-wrought with enamel ornaments. On the first floor is a landing which leads to the boardroom, auditor's-room and cloakroom. The boardroom is 26ft. long, 23 feet wide and 12 feet high, and is well lighted by windows front and back. The panelled oak chimneypiece forms a mark of interest in this room. On the second floor are two storerooms for old books and papers, and the remaining accommodation is adapted for the caretaker's apartments. The heating of the whole premises is effected not only by open fires in certain rooms, but by radiators introduced in suitable places—in the banking hall, passages and the two large rooms on the second floor. Under a part of the building is the basement, which is used for the heating apparatus and storage of coals, &c. The general contractors for the work have been Messrs. Scarles Brothers, Queen's Road, Norwich ; the masonry has been carried out by Mr. J. G. Bush, St. Catherine's

MAGDALEN COLLEGE SCHOOL, WAINFLEET, LINCOLNSHIRE · DETAILS. Measured and Drawn by FRANCIS P. HALSALL, A.R.I.B.A.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Plain, Norwich; and the carving executed by Mr. Minns, of Norwich. The marble work has been done by the Art Pavements and Decorations, Ltd., London. The heating apparatus, fireplaces, &c., have been supplied by Messrs. Barnard, Bishop & Barnards, Norwich; the electric lighting, wiring and fittings by Messrs. Pank & Son, Norwich; and the electroliers in the banking hall by Messrs. Neatby, Evans & Co., London.

MAGDALEN COLLEGE SCHOOL, WAINFLEET.

By FRANCIS P. HALSALL, A.R.I.B.A.

THE following interesting account of this building (which is illustrated by two centre-plates in this issue) is transcribed from the "Life of William of Waynflete, by Tomas Chaloner" (Dr. Chandler, of Selbourn, Hants), written some years previous to 1755; the description of the "Schoolhouse" is by a former master of the school, "Master John Pickburn," dated 1755.

"The bishop possessed certain lands and tenements at Waynflete which William Aulekar and Richard Bennington had devised to him by will, 10th May, 1475 (15 Edw. IV.). He was desirous, by planting grammar learning in the place of his nativity, to extend it in the northern provinces of the kingdom, and resolved to erect there a school and a chapel as he had done near his college. He employed Master John Gigur, warden of Merton College, Oxford, and of the College at Tateshall in Lincolnshire, to procure a site and to contract with workmen for the building; and the indenture for the carpentry is dated the twenty-fifth of April 1484 (1 Ric. III.). He conveyed to the same person the property before mentioned to be made over by him to the President and scholars of Magdalen for the endowment. This amounted to ten pounds a year in land, as we are told by the antiquary Leland; the sum assigned by the head-master for his salary by Wykeham at Winchester, king Henry at Eton, Waynflete at Magdalen, and at St. Paul's, if I mistake not, by Dean Colet. In 1579 Robert Woolbie added to his will forty shillings a year for ever to the stipend."

The following is the description of the "Schoolhouse":—

"The edifice which stands on the south side of the town is handsomely constructed with brick. The length is seventy-six feet, the breadth twenty-six. It consists of two storeys; and appears to have been designed for only two rooms; unless a room twenty feet by eighteen, divided by a partition of solid brickwork towards the east end of the lower storey, belonged to the original plan. It has two towers which project at the west end. In the northern is the staircase; in the other a bell with the inscription round the crown in old capital letters 'Ave Maria Gra Sia Plena,' in which a mistake in one word may be imputed to inadvertency or ignorance. Perhaps the lower storey was intended for the school and an apartment for the master. It now affords a complete habitation to him and his family. The upper part is the present schoolroom, seventy feet long and twenty broad, with six windows on each side and two large ones in the ends. The former have been filled with lilies painted on single panes, of which more than a hundred remain irregularly scattered; some very clear, others obscure; inverted or upright, as they happened to be put together in repairing. All the windows have been strongly ironed; and those below have had massive shutters on the inside, as appears from the iron hooks left in the wall. The civil war and license of the barons had rendered precaution necessary. It was unsafe to abide in a dwelling not barricaded or fortified; a man's house was indeed his castle. What an age to live in!

"The painted glass of the two large windows of the upper storey was removed or destroyed before August, 1755. In 1629 the arms of the founder were extant in that at the west end in two places; in that at the east in one. His portrait was also visible in the latter with the following verse:

'Vulnera quinque Dei sint medicina mei,'

which it is likely had been preceded by an hexameter, likewise in monkish rhyme, making mention of the five joys of the Virgin Mary. The five wounds of Christ were of great celebrity in the Papal church. They were displayed with a chalice on the banner of the rebels who advanced from the north brandishing a cross before them in the time of Queen Elizabeth. The office of Mass to be celebrated in commemoration of them was, according to the rubric, delivered to Boniface Bishop of Rome by the Angel Raphael in person, who told him among other extraordinary things that if it were used for the dead as soon as it should be ended five times the soul should be freed from purgatory. Waynflete, who believed in its efficacy, ordered, as will be seen from his testament, that it should be said for him five thousand times. An altar after the Romish fashion, with an image probably of Mary Magdalen, adorned, I suppose, one end of the upper room which was the chapel and was removed at the time of the Reformation. A pulpit and reading desk remain, but fixed on the tops of two scholar seats and visibly of later construction. Though not intended for a place of general public worship, it is used instead of the church, which is about a mile distant from the town, every other Sunday during the winter season; and it has accommodation for as large a congregation as commonly assemble in the neighbourhood. This practice after being discontinued many years was resumed in 1785."

The building was restored in 1856 and became the middle-class school of the district. In 1877 it was reopened as a secondary school for boys and girls, and as such has been very successful. Boys of marked ability are affiliated to Magdalen College School, Oxford, and exhibitions of the annual value of £40 are given by the college for their education and maintenance.

The Rev. W. Gerrish, M.A., is the present master, and I am indebted to him for the above account of the building.

The common bricks used in the construction are about 9in. by 2¼in. on face, and are set with wide joints, ten courses measuring about 2ft. 5in. In various parts, notably on the lower part of the towers, vitrified bricks are set in various devices, said to be probably masons' marks. The two chimney stacks, which are very fine, were (I believe) carefully re-set by a local builder a few years ago.

MAGDALEN COLLEGE SCHOOL, WAINFLEET, LINCOLNSHIRE: DETAILS OF MOULDINGS.

MEASURED AND DRAWN BY FRANCIS P. HALSALL, A.R.I.B.A.

THE RESTORATION OF KARNAK.

NEVER since the old worshippers crowded the great hall of the Temple of Karnak has that ancient shrine seen so much activity as now prevails. Hundreds of Arab labourers are now at work there, and all the accessories of a great modern engineering enterprise lie contiguous to the grandest memorial of ancient Egypt. Undoubtedly the most important Egyptological work now in progress is the restoration of the Hypostyle Hall. The following description of the present state of the works is by M. Legrain, the inspector and designer for the Ghizeh Museum, who is directing the restoration. There are twenty-seven columns in all that are to be restored. Thirteen fell in ancient times; eleven came down on October 3rd, 1900; and three, which were shaken and threatened to fall, were taken down last year. All these twenty-seven columns will be reconstituted and replaced in their original positions. The first step that had to be taken after the fall of the eleven columns was to take down the three columns whose destruction appeared to be imminent and would have entailed further ruin. One column has also an architrave which threatened to come down, and this enormous piece of stone has also to be removed.

Owing to the impossibility of removing this huge block, which weighs 42 tons, it was necessary to resort to the original method whereby the old Egyptians erected the monuments which are the wonder and admiration of the modern world. Accordingly M. Legrain made a huge inclined plane which required 100,000 cubic metres of earth for its construction. The architrave was taken down by this means, and the enormous accumulation of soil which its removal necessitated is now being gradually removed. The following figures will give some idea of the immense labour involved. Each column has an abacus, 12½ tons, and 13 segments, 14 tons; or twenty-seven pieces altogether. There are, therefore, 729 pieces to be found from out of the mass of ruin which the Hypostyle Hall now presents, and to be numbered and taken away to the depot, and 472 still remain to be discovered and removed, without counting the architraves, which weigh 50 tons, or 25 tons each. On an average six of these blocks are removed every day.

It is an immense labour, for each block has to be methodically arranged and numbered, and placed in reserved space until the time comes for all to be pieced together. Many hundreds of workmen are employed. Each man receives 5d. a day and each boy 4¾d. After everything has been removed from the Hypostyle Hall a commission will come to Luxor to study the foundations and arrive at the necessary means of consolidating the whole. In the summer the hall will be left to dry, and work will be recommenced as soon as the Nile flood permits. By May, 1904, it is hoped that everything will be finished. As visitors enter the Hypostyle Hall they at once notice that the two pylons of the hall are shored-up. These pylons also threatened to fall at the same time as the columns collapsed, and provisional props have been made to avert the calamity. Nothing has yet been done, and the work of underpinning the foundations has to be commenced and, it is hoped, will be taken in hand shortly.

The foundations of this temple of the God of the Morning have been found to be bad, and the columns are being underpinned. Many blocks have fallen and will be pieced together and replaced. A grand find was made on December 28th last. M. Legrain came upon a most beautiful bust of the god Khonsu. Three other portions of the same statue have also been discovered, and it will, therefore, be possible to restore this fine statue in its entirety, with the exception of the small piece which is wanting to complete one of the legs. The statue belongs to the epoch of Hormhabi, nineteenth dynasty, *circa* 1900 B.C. The name of the god is inscribed on the pendant at the back of the collar, and the inscription runs: "Khonsu of Thebes, God of the Day." The expression of this deity is very fine, and it is an excellent example of ancient Egyptian sculpture at its best. The god is decked with the usual emblems, such as the Nilometer, the sceptre Ouas, the flagellum, the pedum, etc. On one side of the head is a long curl worn by young Egyptians in antiquity, a symbol of youth. It is still in use among the young fellaheen. The statue, when restored, will be placed *in situ* in the temple, and will form a magnificent addition to the treasures of Karnak.

Surveying and Sanitary Notes.

An Open Space for Wandsworth.—The local committee at Wandsworth who have in hand the proposal for providing Southfields, Wandsworth (which has a large working-class population), with a recreation ground have ascertained that the price of 16 acres of land in the vicinity is £24,000. The land, the committee report, is desirable and the price reasonable, seeing that £2,000 an acre is being realised for land in the immediate locality. It is hoped to raise half the money locally, and to secure the other half from the county council, this being in accordance with that body's usual practice.

The Society of Landed Estate Agents has just been inaugurated. The principal objects are: (1) to promote and protect the interests of the profession; (2) to advise by mutual conference on all matters of practice relating to the management of landed estates; (3) to disseminate information by means of publications, correspondence, &c.; (4) to watch legislation on matters affecting the interests of agriculture and land generally; and (5) to provide a centre in London for members. The provisional council consists of the following: Colonel Halifax Wyatt, for many years agent to the late Earl of Sefton, president *pro tem.*; Mr. E. F. Chamier, agent for the Rolle estates, North and South Devon; Mr. Dudley W. Drummond, agent for the estates of Earl Cawdor and others in South Wales; Mr. Reginald C. Glanville, agent for the Antony and other estates in Cornwall; Mr. Godfrey Lipscomb, agent for the Margam estates, South Wales; Mr. E. G. Wheler, chief commissioner to the Duke of Northumberland; and the secretary (*pro tem.*) is Mr. William Broomhall, 16, Cockspur Street, Pall Mall, S.W. Membership is restricted to landed estate agents, their pupils and assistants.

Wood-Paving.—Mr. H. B. Lefroy, Agent-General for Western Australia, recently wrote to the "Times" with reference to the decision of the council of the city of Westminster at its last meeting to proceed with paving to the extent of over 130,000 sq. yds., of which about 110,000yds. is to be laid down in wood, involving a cost to the ratepayers of over £70,000. The council decided to award the contract to American red gum and creosoted Swedish yellow deal. He says: "My Government has spent large sums of money in demonstrating the special merits of Australian hardwood for street-paving, and my predecessor, Sir Edward Wittenoom, K.C.M.G., published a pamphlet last year giving in a condensed form the opinions of competent surveyors and engineers in all parts of the United Kingdom, forming an overwhelming mass of testimony that 'Western Australian hardwood blocks, well cut, true to gauge, laid on an efficient system, and carefully supervised, both during and after laying, constitute for city and suburban thoroughfares the best paving known.' . . . . I would earnestly submit that the ratepayers of the city of Westminster should not rashly embark on an untried experiment with a foreign wood to such an extent while thoroughly tried material from another part of the British Empire can be put down at less ultimate expense." He suggests that before adopting what appears to be an undertaking of an experimental character a full statement of the reasons for abandoning what most surveyors consider the best-known paving be laid before the community at large.—Mr. Edward Alcott, of Sunderland Wharf, Millbank Street, Westminster, S.W., replying to this letter, says: "The Hon. H. B. Lefroy is evidently labouring under a great mistake when he asserts that red gum is an 'untried experiment. This wood was first laid as a test in the Strand, at Morley's Hotel by Mr. George Green, late of St. Martin's Vestry. A piece of jarrah, a piece of yellow deal, and a piece of red gum were laid at the same time. The jarrah and deal are both worn out and were removed five months ago; the red gum is there to-day and will last another two years. Before casting insinuations at my wood, would it not be as well to make an inspection of Regent Street, Piccadilly, Tottenham Court Road, Hammersmith High Road, Pall Mall, East Pall Mall, Panton Street, Oxenden Street and Green Street? Green Street was laid five years ago with West Australian hardwood, which has recently been replaced with creosoted yellow deal. The Rue de Lafayette, Paris, is also laid with West Australian hardwood, and will be taken up next month and laid with my red gum. If the Hon. H. B. Lefroy can show three engineers of prominence a street in the West End of London paved with either karri or jarrah that has been down six years under omnibus traffic and now in good condition, I will give £1,000 to any charitable institution you may name. Surely this is a matter for engineers to decide which is the best wood for street-paving, not timber merchants and others indirectly interested.'

SCHOOL BUILDINGS.

BOARD OF EDUCATION'S RULES.

THE Board of Education has issued the following rules as to the building of Higher Elementary Schools:—

1. Article 110 (6) of the code limits the numbers of a higher elementary school to about 300. For such a school ten classrooms will generally be required, since every class should have its own classroom. Of the ten classrooms at least four should be suitable for a class of forty scholars.

2. (*a*) A classroom for forty scholars should have an area of about 620 sq. ft.; a classroom for thirty scholars should have an area of about 480 sq. ft. (*b*) All classrooms must be furnished with single desks; the desks should be 2ft. long, arranged in pairs with intervals of 2in. and gangways of 2ft.

3. Every higher elementary school should be provided with suitable laboratories. (*a*) The laboratory accommodation must be sufficient to provide at one time for the largest class in the school. (*b*) There should generally be one laboratory for chemistry and one for physics. (*c*) A laboratory should afford 30 sq. ft. of floor space for each scholar; the minimum size will therefore be 600 sq. ft., but it is, as a rule, desirable that the laboratory should be somewhat larger. If, however, the laboratory accommodates more than twenty-five scholars, a second teacher would be required. (*d*) Laboratories must be fitted with suitable tables, which must be well lighted; they should be properly supplied with gas and water. For chemical laboratories, sinks, cupboards and the necessary fume closets must be provided. (*e*) A small balance-room may be provided if desired.

4. (*a*) In addition to the classrooms and laboratories, it is desirable that a higher elementary school should include at least one lecture-room, which should be fitted with (1) demonstration table furnished with a gas and water supply and a sink, and (2) a fume closet. A lecture-room should have an area of about 750 sq. ft. (*b*) A small preparation-room fitted with bench sink, cupboard and shelves, and proper supply of gas, should be provided in a convenient position for the lecture-room.

5. A drawing classroom for the more advanced drawing is desirable. It should provide 30 sq. ft. of floor space for each scholar; the best size will be a room with an area of 750 sq. ft. If suitably lighted the hall would answer for this purpose.

6. Other special rooms for cookery, laundry-work and manual instruction should be provided in accordance with the rules in Schedule VII. of the code.

7. A higher elementary school may be planned with a central hall, but no class (other than drawing) can be recognised in such a hall. Good dimensions for such a hall would be 50ft. by 25ft. As an alternative the hall might be adapted for use as a gymnasium when occasion requires. Such a gymnasium for a school of 300 children should have a floor space of 1,800 sq. ft. The gymnasium should not be adjacent to the laboratories.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Water Tower.

NEWCASTLE-ON-TYNE.—ENQUIRER writes: "A water tower is 38ft. high from ground to coping, the tank at the top being 14ft. by 13ft. by 6ft. high of water. The walls are good sound rubble, with a through stone every yard super., 2ft. thick and lined with Claridge's asphalt. The weight of water when full is 30⅓ tons. Will such a construction be strong enough without ties?"

The strength of a rubble wall depends so much upon the quality of the work that it is difficult to judge without seeing it. The lining of Claridge's asphalt is very peculiar. The same amount of material would have made a stronger building if the walls had been thinner at the top and thicker at the bottom. If the foundation is good the tower may be strong enough for the purpose, but there will not be much margin towards the bottom. Tie bolts should not be needed, but there can be no harm in placing 1¾in. bolts with 1½in. ends across the centre 10ft. apart vertically. If, however, the walls are already built it will be better not to disturb them by putting in bolts. HENRY ADAMS.

Rowton Houses.

CARDIFF.—ENQUIRER writes: "Where can I obtain information about the construction and cost of model dwellings erected according to Lord Rowton's principles?"

An article by Mr. H. B. Measures fully describing the Rowton houses was published in our issue for March 20th last.

American Architectural Papers.

HOVE.—HOVE writes: "Which is the best building paper (also being the best medium for advertisements for appointments) published at Boston, U.S.A.; also, what classes are held at the Boston Architectural School, day and evening, and the fee for attending them?"

"The American Architect and Building News" (weekly, 50 cents—eight dollars a year post free to this country; 211, Tremont Street, Boston, Mass.) is a good paper, though it contains little in addition to its plates. "The Architectural Review" (monthly, 50 cents—six dollars a year post free to this country; Bates & Guild Co., 42, Chauncy Street, Boston, Mass.) is a better class production, its plates being especially good. "Architecture" (monthly, 30 cents — four dollars a year post free to this country; Forbes & Co., Ltd., 160, Fifth Avenue, New York) is even better produced, though its plates are not so numerous. "The Brickbuilder" (monthly, 50 cents—six dollars a year post free to this country; Rogers & Manson, 85, Water Street, Boston, Mass.), as its names implies, is devoted to brick and similar buildings. For your purpose we think you will find the "American Architect" most suitable. Its charge for small advertisements is 15 cents a line (eight words to the line) each insertion, 50 cents being the least charge. In regard to your other question, a long article on the Department of Architecture of the Massachusetts Institute of Technology at Boston appeared in our issue for August 14th last. Full particulars of the courses are given in this article, but if you desire further information you should apply to the secretary, Mr. H. W. Tyler, 491, Boylston Street, Boston, Mass., who will send free a special descriptive circular of the institution. We do not know, however, whether the fees for admittance are stated in this circular.

"The Architectural Review."

W. W. writes: "I desire to take in another paper in addition to yours. Please recommend one something like the "Studio," but not so expensive."

Obtain the "Architectural Review," published monthly at these offices, price 6d. nett. (see advertisement on page vii of this issue).

London Buildings to Measure for R.I.B.A. Final Examination.

LONDON, W. C.—W. P. writes: "Please mention a building in or near London (Renaissance style preferably) suitable to measure for the R.I.B.A. Final Examination where permission can easily be obtained."

Measure one of Wren's churches. An article on "The City Churches: How to Obtain Permission to Sketch and Photograph in Them" appeared in our issue for September 26th, 1900.

Buildings Exempted under Model By-laws.

CARMARTHEN.—ENQUIRER writes: "I shall be glad to know whether workhouses, schools and colleges, the plans, &c., of which have been approved and sanctioned by the Local Government Board, the Board of Education, and the Charity Commissioners are exempted under the Model By-laws."

Workhouses, schools and colleges are not exempted buildings. Under clause 2 of the Model By-laws the following descriptions of buildings are exempt: All buildings in His Majesty's possession or used and employed for His Majesty's service, prisons, county or borough lunatic asylums, buildings connected with the navigation or the collection of tolls in respect of docks, harbours, rivers or canals; buildings connected with the working of the mines; buildings erected according to plans approved by the Land Commissioners or Board of Agriculture under the Improvement of Land Act, 1864, or other Acts for the improvement of land; any building erected from plans approved or directed in pursuance of any statutory provision by one of His Majesty's principal Secretaries of State; together with any building used for a plant house, summer house, poultry house, aviary, &c., under the conditions laid down in this clause.

T. E. C.

Architect's Charges.

ENQUIRER writes: "Will you be kind enough to inform me whether the enclosed account is reasonable? The architect refuses to give up the plans until the account is paid, so I cannot send them to you, but the £20 is for plans for the erection of property on a very small piece of land. I have offered £40 in settlement and the architect has offered to accept £50."

Upon the face of it the account bears evidence of having been inflated to the utmost. At the same time, if the item of £20 was agreed upon as is stated, the rest is worth more than another £20, and it would be well to pay the architect the sum which he says that he is willing to accept, and so settle the matter; but not until he has delivered up the plans. No man can charge for goods which he retains, not even an architect. G. A. T. M.

Architectural Training.

MERTHYR TYDFIL.—AMBITIOUS writes: "I am in an architect's office, and have a few hours after 6 p.m. to study at home. How can I best employ my time? Is there any book instructing beginners how to prepare plans, sections, &c., to colour and trace well?"

We should advise you to attend evening classes in building construction and in geometrical and freehand drawing. You should obtain Rivington's "Building Construction" (4 vols.) if possible, or, if not, Mitchell's "Building Construction (2 vols.), a cheaper and smaller work, and study them thoroughly. "Hints on Architectural Draughtsmanship," by G. W. Tuxford Hallatt (1s. 6d.), gives a few hints on architectural drawing and tracing, but the best way is to obtain experience by practice. If you consider that your present employment offers little opportunity of gaining more knowledge, enter a builder's office and thence go on the job, or obtain a post as time-keeper or under-foreman if you can get anyone willing to try you. Thus you could gain an insight into practical building. If you feel you have sufficient ability, you should study mathematics and mechanics (see answer on this subject on p. 122 of our issue for March 20th last), and draw from natural objects such as flowers, birds, animals, &c.; and when skill has been acquired in accurate delineation and harmonious colouring, trees and landscapes can be worked at. This is the finest education of taste you can have. Read Ruskin's "Elements of Drawing."

RUSHDEN.—O. R. writes: "I am twenty years of age, and have had about four years' general experience. I desire to sit for some examination, the 'working up' for which would take me through a good field of study, and which would afterwards be a sound qualification. I may say that the R.I.B.A., with its exhaustive demands, would, I fear, be too heavy a task for me to undertake."

The R.I.B.A. examinations are on the whole most excellent. Anyone who aspires to call himself an architect should know as much as is required to pass them, but of course the examination system is not suited to some persons. If you really do not feel capable of the R.I.B.A. examinations, the Society of Architects hold a single one which appeals to many; particulars can be obtained from p. 263 of our issue for December 6th, 1899. Then the South Kensington Examinations offer a graduated course in building construction.

Wrexham Parish Church.

LONDON, N.—S. M. M. writes: "Has St. Giles', the parish church of Wrexham, Denbighshire, been illustrated in your journal? If not, is it likely to appear shortly?"

No.

Situation and Soil for House.

HEYWOOD.—H. L. writes: "Which is the best position in which to build a house, and which is the best land? The land I have in view is facing south and, I believe, is sandy."

A sandy subsoil is a suitable one to build upon as it does not retain moisture, which clay does. The aspect of the house you have in view is a good one: the living room should face south, as it is most important that it should get the sun for a good part of the day. The kitchen should, if possible, always face north, for in the summer it needs to be as cool as possible, while in the winter the fire will warm it. A good steady light is always required for a kitchen; if possible it should fall on the range from the side, in order that a shadow may not be cast over it when a person is at work.

Obtaining a Situation in a Belgian Architect's Office.

SOMERSET.—SOMERSET writes: "What steps should I take to get into a Belgian architect's office? Would an English assistant be able to get a berth in a foreign office as tracer at a small salary? I wish to study old work in Belgium, but not having sufficient means to keep myself there for any length of time the above seems the only course open to me."

If you can speak French well and are a good tracer, with a knowledge of building construction, you would perhaps be able to obtain a situation in a Belgian architect's office, but the remuneration would be small. You had better apply to the British Consul at Antwerp or Brussels for advice as to where best to hear of situations vacant and apply to several architects. Of course you would be more likely to obtain a berth if you were over there first. But, after all, is it worth taking all this trouble to study Belgian architecture? Information of use in architectural work can be gathered as well from old and new buildings in this country, and perhaps better. You might go on a holiday tour, however.

Drawing Flutes on Columns.

PADIHAM.—H. H. writes: "In preparing the sheets of orders for the R.I.B.A. Intermediate Examination, is it necessary to show the flutes throughout the whole length of the columns? In the case of columns with entasis this would prove tedious, I think."

The entasis is so slight that it is not difficult to draw by carefully and regularly increasing or decreasing the distance at which the point of the drawing pen is kept from the edge of the T-square or straight edge, the positions of the flutes having been laid down in advance at several different positions along the height of the column. A little practice should be indulged in first, however, on a piece of tracing paper, and if the experimental efforts are not successful the flutes might be shown in pencil throughout, but inked in for a short distance only at top and bottom. G. A. T. M.

THE ERECTION OF TEMPORARY BUILDINGS.

IN an article on "Light Buildings, Locks and Safes" which recently appeared in the columns of the "Morning Post" Mr. W. E. Martin said:—

For the rapid erection of fireproof and weatherproof temporary buildings galvanised corrugated iron is indispensable. As a sanitary material it is perfect, being absolutely non-porous. In point of fact no other constructive material can replace it, where the security and comfort of a permanent building are required for a limited time at a proportionately moderate cost. One great objection to all other materials used for external wall facing and roofing is that they are more or less porous. Brick and stone, for example, absorb rainwater in large quantities, and this is transmitted into the inside of the building and gradually thrown off into the atmosphere, thus rendering it damp and uncomfortable for days together in the immediate vicinity of walls faced with these materials. The use of corrugated iron does not expose the occupants of a building to any such annoyance. It should be borne in mind, too, that in an ordinary wall of brickwork the mortar joints are more porous than the bricks, and act as efficient conductors of rainwater to the inside plastering. As a brick wall 12ft. high is made up of at least 1ft. of such mortar it is not surprising that after driving rain in exposed situations damp should show itself on the inside plastering.

"Galvanising."

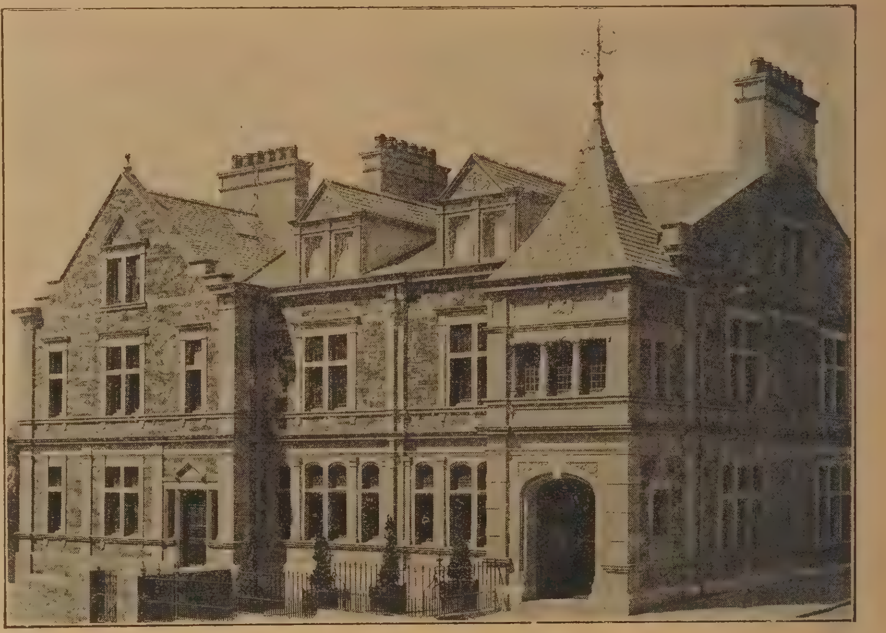
Galvanised iron sheets are always fixed overlapping horizontally as well as vertically; hence the joints are as watertight as the sheets themselves. The term "galvanised" as applied to the iron sheets under consideration is incorrect, in view of the fact that no galvanic action is necessary to coat iron with zinc. A sheet of iron, the surface of which has been chemically cleaned, will when dipped in molten zinc take up enough of that metal to afford an efficient protection against the weather for years. Hence the iron is really "zinced" and not "galvanised."

Rust.

In dry air at ordinary temperatures iron will not rust. When heated to redness, however, black scales of iron oxide are formed, and when at a white heat the whole metal is gradually converted into the same substance. Pure water, which is free from carbonic and free oxygen, will not tarnish polished iron, but if water contains these substances it attacks it vigorously, especially in presence of acid vapours of any kind. Zinc, which is used to coat the iron sheets, is also found in combination with carbon and oxygen, in which condition it is known as calamine, the ore from which it is extracted for commercial purposes. Exposed to the atmosphere, zinc oxidises slowly, and since it is insoluble in water a zinc coating affords an effectual protection to the underlying metal as long as it lasts. Acids will dissolve the zinc oxide as well as the zinc itself, however, so that buildings covered with zinced iron should not be exposed to the action of acid fumes or water holding any trace of acids in solution. It follows therefore that the life of a sheet of zinced iron is that of the zinc which covers it.

Different Metals in Contact.

Another point to be considered is that two metals placed in contact and exposed to atmospheric influences invariably give rise to some form of galvanic action, which facilitates their combination with carbon and oxygen, a process utterly destructive of their value as covering materials. Old wrought-iron railings leaded into stone are found eaten away where the lead and iron come in contact, and lead-lined cisterns or soldered sheet lead traps invariably fail at the junction of lead and solder. In every modern house iron, copper, lead, tin and zinc are found in the same circuit, forming circulating and other water systems; the leakage of taps and other parts of such plumbers' work, as well as the failure of iron railings and lead cisterns, can be traced to this galvanic action, which would seem to be never taken into account by builders or sanitary plumbers. This action, apart from ordinary oxidation by the atmosphere, has much to do with the premature destruction of the zinced iron sheets used in temporary buildings. Zinced (or "galvanised") corrugated iron is extensively used in the erection of churches, schools, hospitals, cottages, stables, workshops, sheds, barns and other buildings, and it will be found that for all such erections the employment of specialists in this class of work has an immense advantage in point of economy over that of ordinary skilled or unskilled workmen, who are not accustomed to handle and work in this material.



BANK AT WINDERMERE. ROBERT WALKER, F.R.I.B.A, ARCHITECT.

How to Build.

The gauge of iron generally used for this work is that known as "24": this when zinced runs to "22" on the Birmingham gauge, and should weigh 1⅖lb. to the super. ft. or 1cwt. 0qr. 8lb. to the square of 100ft. Seven-pound lead to cover the same area would weigh 7cwt. 1qr. 14lb., slate about 7cwt. 1qr. 24lb., plain tiles 11cwt. 1qr. 1lb., and stone tiles 17cwt. 2qr. 1½lb. For roofing, iron is therefore a comparatively light covering, and, unlike tiles or slates, needs only a mere skeleton framework of timber to support it. Corrugated sheets are of various lengths up to 12ft., which is the largest made. The corrugations are 3in. or 5in. in width and about 1½in. deep. In a one-storey building it is an advantage to have the sides covered with sheets each of which reaches from the ground to the eaves; hence they are always used the exact length required, without cutting or waste. The foundations of all iron buildings should be of concrete or brickwork, or of both combined. Starting with concrete, which should be not less than 18in. wide, a few courses of 14in. brickwork are laid on it, then a course of two of 9in. brickwork, followed by two courses of stretchers, or 4¼in. work. All the brickwork is carried up flush on the outside, and the "set off" from the 9in. to the 4½in. work takes a 4½in. by 3in. plate, on which the floor joists rest. The superstructure is wood framing, having uprights about 2ft. apart, which are tenoned into a sill; the upper ends carry a plate which takes the roof. Horizontal binders are fixed between the uprights, and the whole framing is stiffened with diagonal bracing—a plan which is necessary to resist wind pressure. The uprights are 2in. thick by 4½in., 5in., or 6in. deep, according to the height of the proposed building; the heads, sills and diagonal braces must be of the same depth. The roof consists of purlins and ridge only, which rest on principal rafters, these latter being tied in at the wall-plate level to prevent undue lateral thrust on the walls. Common rafters are not used for iron roofs. Iron sheets offer little resistance to the passage of heat or cold from the outside to the inside of any building. It is usual, therefore, to cover all the wood framing externally with a layer of thick hair-felt before fixing the sheets. A still better plan would be to cover the framing with rough boarding under the felt. The corrugated sheets are fixed with cone-headed "galvanised" nails and washers; the ridge, eave gutter and down pipes should all be of the same material. The framing inside is covered with boarding ploughed and tongued, and beaded or V-jointed as may be preferred. The flooring is also ploughed and tongued. An iron building should not be painted for twelve months after it is erected, and the painting should be renewed every three years.

Preservation.

As a pound of paint will go much farther on iron than on wood or brick, painting an iron building is a cheap way of adding to its durability. It is not wise to purchase a second-hand iron building for re-erection, because the sheets are always more or less damaged in taking down and removal, and when rusting once sets in it proceeds rapidly. Some local authorities refuse to allow wood framing in iron buildings, and it is then necessary to construct the framing of T- and angle-iron. Wooden temporary buildings are framed exactly like those already described, the outside of the walls being lined with weather boarding instead of iron sheets. Ordinary imported weather boards are of inferior quality. One-inch ploughed yellow boarding should be used instead, with properly fitted notched boards at the angles. These buildings are usually roofed with iron sheets or felt; the second named will last for years if it be kept properly tarred and sanded. All wood framing in the walls and roofs of temporary buildings should be well ventilated, and if linoleum or other non-porous floor covering is used it is absolutely necessary that air be freely admitted to the underside of the floor boards and joists. The heating of wood and iron buildings may be effected with stoves standing detached from the walls. Iron flues to carry off smoke should be supported at some distance from the woodwork, and pass to the outside through the iron roofing. Wherever, however, it can be conveniently done, all fireplaces and flues should be built in brickwork.

The Bank at Windermere illustrated on this page has just been completed for the Lancaster Banking Co. It is built of the local slate, stone, shoddy and freestone dressings. In the banking room all the doors are of oak, relieved with mahogany, and an oak dado runs round this room; the walls are broken up with pilasters having carved caps, &c. The work has been done by local men, except the lead glazing and the faïence dadoing; the former is by Messrs. Shrigley & Hunt, of Lancaster, and the latter by the Opalite Company, of Manchester. The architect was Mr. Robert Walker, F.R.I.B.A., of Windermere.

NEW YORK IMPROVEMENTS.

THE STUPENDOUS EXPENDITURE.

LONDON is undergoing such great changes at the present time that it is interesting to note what other cities are doing. According to the New York "Sun" no other city is improving itself at the rate of New York. Tunnels, bridges, reservoirs, public buildings, new drives and new parks are in hand the total cost of which is literally stupendous. Many of the largest projects are being rapidly pushed to completion.

The £7,000,000 rapid-transit subway from the post-office to Kingsbridge and Bronx Park has now been in process of construction for about a year, and one-fifth of the work on it is completed. The probabilities are that the entire subway will be finished by the autumn of 1903, and that trains will be running in it by the following Christmas, nearly a year ahead of the contract time. Next comes the £1,600,000 Brooklyn tunnel, which is to run from the post-office terminus in the subway to the Battery and under the East River to Flatbush Avenue. Plans are now being drawn and soundings are being made. The contract will probably be let before Christmas, and in less than three years the tunnel may be completed. Under the North River there is already a tunnel, more than half complete, on which millions have been spent. It runs from the foot of Morton Street to Fifteenth Street, Jersey City, and less than a quarter of a mile of it remains to be excavated. But several companies have gone into bankruptcy over the project, and it waits, its workings full of mud and water for the last ten years, for new hands to finish it. There is one other tunnel project, newer than all the rest, but one which the next five years is likely to see carried out. Long Island Railroad interests have just incorporated a £200,000 company to construct an underground railway four miles long, to pass under the East River and connect the Long Island terminus in Long Island City with a point in Manhattan south of Fiftieth Street and west of Broadway.

After tunnels, bridges. The new East River Bridge from Delancey Street to Brooklyn may be finished within a year or so. The towers on both sides are complete now, the preliminary cables are up, and the contractor is making the wire for the big cables. After that the approaches have to be built. It will be two years perhaps before these are in shape, and the city will have another great enterprise complete. The cost is about £3,000,000. Less than two miles above, soundings are being taken for the £1,600,000 cantilever bridge from Sixty-second Street to Blackwell's Island, and thence to Astoria. The plans have been drawn and are now awaiting the approval of the War Department. The bridge may be completed within five years. A third East River bridge, known as yet only as East River Bridge No. 3, is in contemplation. Like the present Brooklyn Bridge, it is to be of the suspension variety. The minimum cost will be £2,000,000. There are two bridges in contemplation across the North River, though both projects are somewhat in the air at present. Plans for the North River Bridge from Fifty-ninth Street to Weehawken have been drawn, and the War Department has approved them. The project is dormant because Governor Odell vetoed the Bill which gave over West Street as far south as the Battery to the bridge company for an approach. Whether the company will revive the plan in another form or will offer new terms it is not known: £12,000,000 has been estimated as the cost of this enterprise.

Nearest to completion of all the city's building projects is its new prison on the site of the old Tombs, on which work has been going on for nearly four years. The prison is being built in two wings, each wing as large as the old jail. The first is almost finished. A few cells in it are already occupied, in fact. It will be fully occupied in a few months, and then the old jail can be torn down and the second wing built on its site. £100,000 has been spent on the first part of the work.

The walls of the new Hall of Records, which the city is building on the ground bounded by Centre, Chambers and Duane Streets, are built up to the second storey. In the matter of new buildings this is the most costly improvement New York now has on its hands. It is to cost more than £845,000.

The foundations for the Public Library in Bryant Park, the city's other costly new building, are ready, and a short time ago the contract for the superstructure was accepted. The entire structure will cost £700,000. It will be built of marble throughout.

Up on Morningside Heights another new structure of a semi-public character is being constructed which at no very distant date will be one of the city's show-places. This is the Protestant Episcopal Cathedral of St. John the Divine. It is being built in sections, the chancel first; and the crypt and the great chancel arch only have been completed so far. No real estimate of the cost of it all has been made. Nearly £200,000 have already been expended, and much more will be required.

In the same district also many millions are being spent on new buildings. The new Columbia University, just off the heights, is only the first link in a remarkable chain of institutions of learning. The new college of the city of New York will come next. The Manhattan College is a little west of that. Across the river and the valley is the New York University, carrying the line along to Fordham, where the picturesque St. John's College ends it.

In the Bronx the city is spending its millions lavishly. On the site of old Jerome Park five thousand workmen have been toiling for the last three years on the new Jerome Park Reservoir, now more than half complete, which is to supply the entire upper half of the city with water. Nearly £3,000,000 are being spent there in the construction of a vast retaining-basin.

Thirty miles above, and forming part of the same water-system, more millions are being spent on the huge Cornell Dam. Years have been spent on this immense mass of masonry, which at the base is 100ft. wide, and it is now nearing completion. When it is built it will take five years more to fill the basin it encloses. Then, where now are farms and villages, there will be an immense inland sea of 4,000,000,000 gals. of water for the city's reserve-supply. Trees and green fields will be buried 50ft. below the surface.

That is outside the city line. Inside, a bridge costing more than £100,000 is nearly built, spanning the Harlem River from 145th Street, Manhattan, to 149th Street, The Bronx. Another, equally costly, is being erected from Willis to First Avenue. Both will be finished by winter.

In Bronx Park the city is helping to construct the most complete zoological garden in America. A space of more than 260 acres has been turned over to the New York Zoological Society, which has already a great collection there housed in the best buildings that can be devised for the purpose. A great court of honour, surrounded by fine buildings, is planned. The whole scheme is the most ambitious of its kind ever conceived.

The small-park system begun in Tweed's time is being carried into effect throughout the city at an enormous cost. Seward Park, one new breathing-place of this kind, is just open adjoining Rutgers Street on the east side and another park in Little Italy (costing £1,000,000), now the most crowded tenement quarter, is nearly ready. The park scheme contemplates a score more such gardens for the poor.

The great viaduct extending from Riverside Drive northward to the Boulevard Lafayette is complete. It spans the Manhattan Valley with great steel arches as high as Brooklyn Bridge. From it there is the finest view in the city. A dozen blocks below a smaller viaduct, nearly complete, levels the beautiful drive and carries it over Ninety-sixth Street, in order that heavy trucks going to the dock at the river-front may not interfere with the pleasure of those who ride or drive by.

Soon the Soldiers' and Sailors' Memorial, a monument which has cost £50,000, will beautify Riverside Drive at Eighty-ninth Street. Years have been spent in the attempt to find the best site for it. It is in the form of a temple. The inscriptions on it are about to be cut, and in the coming autumn it will probably be opened.

Another great drive, a £2,400,000 concourse, is planned for the Bronx. Surveys have been made for it, and its turn for construction will probably come next in the line of the northern improvements. So far it has been too expensive a luxury for the city to acquire.

The Museum of Natural History is still another great enterprise which time will develop. It is a handsome building now, though only that part of it forming the Seventy-seventh Street front has been completed. The plan in it entirety is for a great collection of buildings covering five city blocks. The cost will be £2,600,000 at least.

The city has so far spent only a few million dollars on its great dock improvement, and it has constructed six piers only, those between Bloomfield Street and West Eleventh Street on the North River. These new piers will be extended up to Twenty-third Street as soon as the city can afford it and the work can be done. The cost will be enormous, but the growing commerce of the port will pay for it.

At Bowling Green a site has been cleared for the new Custom-house, and the foundations are being dug. The cost will be nearly £400,000, and it will be finished in little more than a year.

The Chamber of Commerce is spending £300,000 on its new home in Liberty Street. That, too, will be a handsome addition to the financial district of the city. The site is now almost ready, and the building will be open in a year.

The improvements in asphalted streets, in street-car transportation, in small parks and in private buildings that are being made annually are enormous. There are still 100 miles of horse-car line within the city limits, but these will not remain long. It is all improving the metropolis on a scale and at a rapid pace not equalled anywhere else in the world. Ten years hence New York will be transformed.

A NEW LONDON PRINTING WORKS.

A LARGE building has just been erected, to be known as Norwich House, from the designs of Mr. Alfred Conder, F.R.I.B.A., of Palace Chambers, Westminster, on the south side of Norwich Street, near Fetter Lane. It is an extension of Messrs. W. Speaight & Sons' printing works, which have been carried on for many years at 98 and 99, Fetter Lane. The premises communicate by an opening in the party-wall on the lowest storey. The front of the building is of Portland stone relieved by red bricks, Burmantoft glazed bricks being used for the lower part. The lower ground floor is entirely devoted to the purposes of a machine-room, and has a fireproof floor over. It measures about 61ft. by 56ft., and is 16ft. 6in. in height. The walls are built of white glazed bricks, except at the lower part, where brown glazed bricks are used. The floor is of concrete, and finished with granolithic paving. The staircase, to meet the fire rules of the London County Council, is enclosed with brickwork, and the steps are of concrete, finished with granolithic paving and Doulton treads. The walls of the lavatories on all the floors are covered with white glass tiles. Motive power is provided by a tandem compound steam-engine, with the Cerliss gear of 95 h.p. A dynamo, erected on a platform above and driven by the engine, generates current for the motors, which propel nearly all the printing machinery and other plant in the building. Electric light is installed throughout the building, arc incandescent lamps being used for the lower floor and incandescent lamps for the remainder. On the ground floor is the publication department which is a large, spacious and well-lighted room, having offices cut off by glazed partitions, whilst it is approached by a wide entrance faced with glazed brickwork. Narrow maple flooring, secret nailed to allow for the even wearing of the surface, has been used throughout the building. The first three floors are arranged for the composing, reading and other departments. The stereotyping foundry occupies the whole of the top floor, electricity being the motive power for all the appliances. A lift communicates with all floors, from the machine-room to the stereotyping-room, and is propelled by electric current, the motor being placed in a separate room immediately over the well of the lift. Mr. Henry Young, of Junction Works, Herne Hill, is the builder; and the electrical work has been carried out by Messrs. George Forrest & Son, Messrs. Delby and Williamson being the consulting engineers.

TENDERING IN FRANCE.

"THE French law in regard to making tenders for contracts has some features which may afford useful hints to architects and others in this country," says the "American Architect." "As every architect and contractor knows, there is here no uniform practice whatever. Some years ago an unfortunate architect who had asked for competitive bids on behalf of a client was sued by one of the unsuccessful bidders for compensation for estimating, and through the medium of an intelligent jury was compelled to pay a round sum. Certain contractors saw in this occurrence a new source of profit, and allowed it to be understood that they would ask for payment for their time devoted to estimating in certain contingencies beyond the architect's control. As the effect of this announcement was to exclude permanently from architects' offices all the contractors who participated in it or sympathised with it, the others found it best to go on in the old way, notwithstanding the occasional disappointments which they suffered in consequence. Under the French law the contractor is much better protected than with us, while the architect instead of receiving, as with us, the blows which the owner and contractor aim at each other, is assigned his proper place as the arbitrator, not the principal, in their misunderstandings. In general, estimating is a more formal affair in France than here. The bids are really instead of nominally sealed, and are addresed, as they always should be, to the owner as one of the parties to the contract which is to be entered into. Of course, as with us, they are submitted to the architect to see whether the conditions required by the specification have been complied with in the bids, but the owner is always the one to whom they are consigned for final decision. Under the French law, if an owner either directly or through his architect invites bids for a construction without expressly reserving the right to reject any of the bids he must make a contract with one of the bidders or pay reasonable damages. The owner may, however, at any time before opening the bids give notice that his carrying out of the proposed work is conditional on his being able to contract for it at or under a given sum; and, in this case, if all the bids exceed the stipulated sum he is not bound to accept any of them or to pay damages to anyone."

A COVENTRY BRICKWORKS.

AMONGST the industries of Coventry brick-making occupies a more important position than is generally recognised. What was a small brickyard on the Stoney Stanton Road has developed during the past five years into one of the most extensive works of its kinds in the Midlands. From 170 to 180 hands are employed at Webster's Brickworks. The plant is of modern construction, and a railway three-quarters of a mile in length connects the works with the London and North Western line near Foleshill Station. This railway is in itself a considerable enterprise, and is apparently destined to largely effect the carrying of material to a wharf and sidings for which there is ample room for extension close to the Stoney Stanton Road. The raw material is brought up from the clay pits in trolleys running on metals and drawn by an endless chain to the mills where it is ground and mixed and prepared for the moulding machinery. Thus with very little interference from the time the crude clay is pitched into the mill, a constant stream of bricks ready for the kiln is produced. There is a great demand for pressed bricks. How different is the process of the easy running machinery to that of the old-fashioned toiler in the brickyard laboriously pounding away to get his material into plastic condition and to pass it through the mould, working in wet and discomfort, an object only distinguishable by movement from the clay he was handling! The introduction of machinery requiring careful attention and the rapid handling of the produced article has evolved a different type of workman. The popular notion that any man, provided he is strong enough, will do for a brickyard is like so many other general ideas, decidedly wrong. The amount of work that can be spoiled by unskilled handling is something appalling.

If great improvements have been made in the fashioning of the clay, still greater advances may be claimed for the method of drying or baking them. While the ancients sun-dried their bricks 4,000 years ago, the Romans when they came to this country brought with them the knowledge of the process of baking in kilns. The primitive form of kiln is still to be seen in operation in some parts of the country, but beside the immense patent kilns of the up-to-date brickworks they are very puny and laborious constructions. The modern kiln, with its catacomb-like chambers, is fired from the top with numerous channels. At one end the interior of the kiln is a mass of intense heat, gradually cooling down along its length, until at the other end the chambers can be opened and the finished goods taken out. The capacity of these kilns will take 17,000 bricks, and to work the chambers out from one end to the other occupies a month. There are five such kilns upon the works under notice. Bricks, chimneypots, ridges, quarries, and various kinds of plain and decorated productions of the ceramic art are all burnt in these kilns. The colour almost entirely depends upon the amount of iron contained in the clay; as the percentage of iron increases, so the colour deepens from cream or buff to yellowish and dark red.

LONDON TEN YEARS HENCE.

MR. HUGH B. PHILPOTT contributes an interesting article on "The London of Ten Years Hence" to the current number of the "Pall Mall Magazine," illustrated by several excellent sketches by Mr. Hedley Fitton. In the course of the article Mr. Philpott says:—

Let us imagine the case of a London citizen who knows his London fairly well, and is interested in it—a somewhat exceptional person, it must be admitted—and who, after an absence of about ten years, returns to town, say, in the spring of 1911. What are the most striking changes he is likely to observe in the streets and buildings? Imagine him arriving at Victoria Station and setting out on a journey eastwards through some of the principal streets. . . . Passing down Victoria Street, a thoroughfare which has not greatly altered its familiar and rather gloomy aspect, he first turns to the right into Ashley Gardens to see what progress has been made with the great Roman Catholic cathedral, the construction of which had already been well advanced before he left London. It is a curious site for so important a building as a cathedral, but it is characteristic of London that its great public buildings are often situated anywhere but where they might be expected to be found.

The Westminster Cathedral, so far from dominating the neighbourhood, has to be sought with some diligence by the wayfarer unfamiliar with the district. Nevertheless it is in truth not only one of the most important buildings in London, but one of the most interesting modern buildings in Europe. Apart from the interest that attaches to it as a splendid monument to the vitality of a great Church and the devotion of its adherents, it has a special and unique architectural interest as being one of the very few buildings that have been erected within recent years in the Byzantine style. There is, I believe, but one other modern church in Western Europe which is Byzantine in feeling—namely, St. Joseph's, at Antwerp. . . . The building is on a colossal scale: it is 380ft. long by 170ft. broad, and will hold a congregation of about 10,000 people. The campanile, when carried to its full height, will be 300ft. high, and the great arch over the west door is said to be the largest arch over any church door in the world; the tympanum of the arch, which is 27ft. across, will be filled with mosaic. The doors are to be executed in teak, and covered with bronze plates like the famous doors of St. Mark's, Venice. When we enter the building the impression of vastness is rather enhanced than diminished; the height inside in 120ft., and the building is so planned that a very large proportion of the congregation can have an uninterrupted view of the high altar. No stained glass is to be used, and the interior on a bright day, when the white light streams through the clear glass windows on the many-tinted marbles and mosaics, will be a spectacle of almost unexampled splendour. The marble columns which support the vaulting of the aisles and galleries on either side of the nave and the arches of the transept are a very beautiful feature. They are twenty-nine in number, and each is formed of a single block of marble, often of very beautiful colour and figure. Their bases are of Norwegian granite, and the capitals are of white Carrara marble, elaborately carved, and each differing in design from every other.

This vast undertaking, the greatest material creation of the Roman Catholic Church in England since the Reformation, was projected many years ago. It is now nearly thirty years since the first design was produced; this was by Henry Clutton, and was for a French Gothic cathedral. The architect of the present cathedral is Mr. J. F. Bentley, who has long been a close student of the architecture of the East, and has been impressed by the possibilities of the hitherto neglected Byzantine style for modern church buildings. . . . After inspecting the Westminster Cathedral our traveller continues his journey along Victoria Street, passes Westminster Abbey, and reaches the corner of Parliament Street. Here his attention will be at once arrested by a stately pile of buildings standing on what is now a cleared area, but was until recently occupied by a block of rather mean buildings and shops. The buildings in question are the new Government Offices, which are being erected from the designs of the late Mr. J. M. Brydon. When the scheme is fully carried out the block will extend from Parliament Street right back to St. James's Park. Dignified and imposing though it be, the building itself will not, perhaps, arouse very great interest. Its main elevations are, in truth, a trifle commonplace; perhaps the architect has been limited by the necessity of making his building harmonise with its next-door neighbour, the not very beautiful Home Office of Sir Gilbert Scott. But what is like to strike the observer very forcibly is the splendid improvement which the erection of this block makes in the general appearance of this historic corner of the Metropolis. . . . . Passing along Parliament Street into Whitehall, the visitor of a few years hence will notice that another great change has been made. Adjoining the famous Banqueting Hall of Inigo Jones, now used as the Royal United Service Museum, and facing the Horse Guards, will stand the new War Office—another stately and impressive pile. It was designed by Mr. William Young, an architect of rare ability and charming personality, who, unhappily, like Mr. Brydon, has not lived to see his plans carried out. It is a strangely irregular site on which the War Office is to be built . . . . but the observer of the completed structure is more likely to be impressed with the fine effect of the facade to Whitehall than with the fact that the four sides of the building are of unequal length and only one of its angles is a right angle.

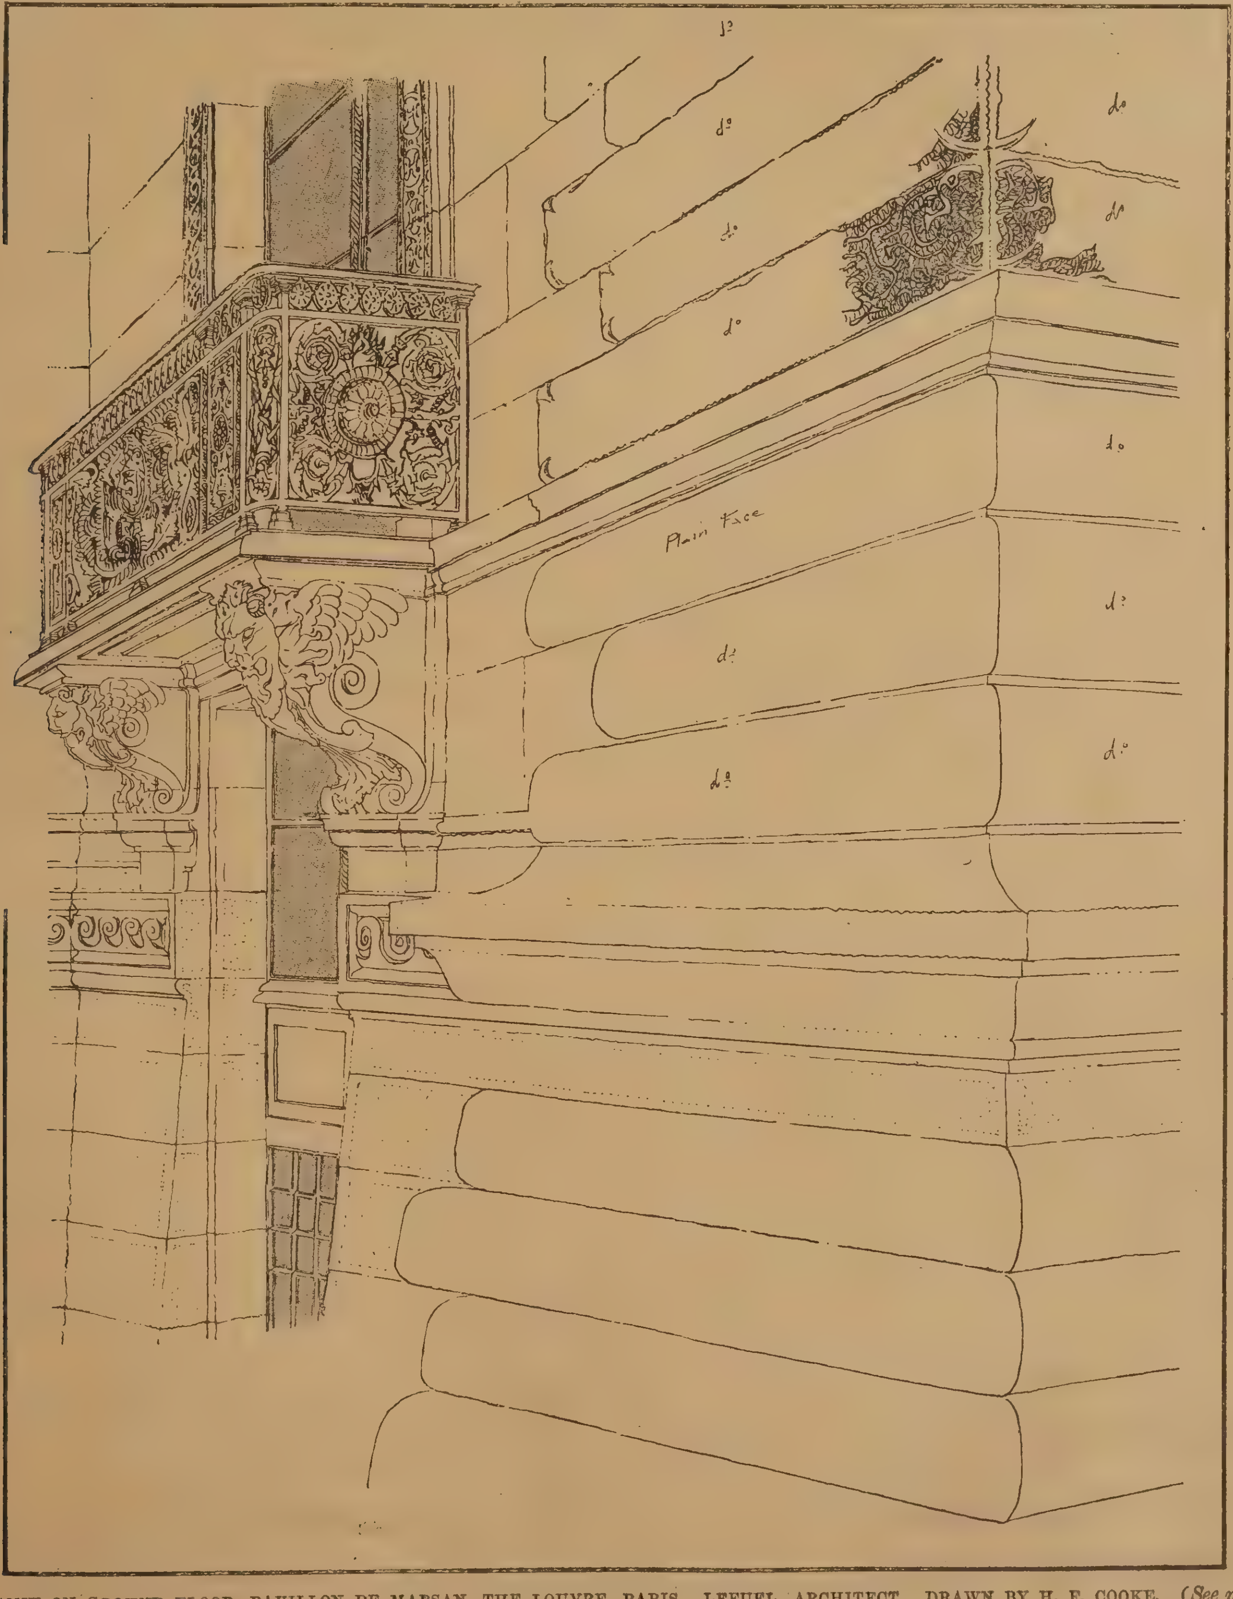
If the visitor now turns aside for a moment into St. James's Park, he will see that during his absence the buildings devoted to the Admiralty have undergone extensive enlargement; but as the new blocks have neither dignity nor beauty, being virtually reproductions of the unsightly red brick and stone structure at present standing, little time need be spent in their contemplation, and the visitor will do well to return to Whitehall and take another look at what will have become one of the finest thoroughfares in London—it would scarcely be an exaggeration to say one of the finest in Europe. . . . . Continuing his journey eastwards along the Strand, the visitor by the time he reaches Wellington Street finds himself face to face with an entirely unfamiliar prospect. . . . . He has now reached the outskirts of the greatest street improvement that has taken place in London since the rebuilding of the city after the Great Fire. Before him stretches a fine broad thoroughfare (nowhere between Wellington Street and St. Clement Danes Church is it less than 100ft. broad), flanked on the right by Somerset House and on the left by handsome new shops and offices and a new Gaiety Theatre and Restaurant. To the left stretches away a crescent-shaped street—an entirely new thoroughfare—which is also 100ft. broad, and is flanked by buildings of dignified and substantial appearance, arranged with a symmetry and order to which our London streets are too little accustomed. The beautiful church of St. Mary-le-Stand, no longer hemmed in by houses on its northern side, stands out in the middle of the widened Strand with a new grace and dignity; and in the distance beyond—more clearly seen than of yore—rise the beautiful tower of St. Clement Danes and the graceful *flèche* of the Law Courts.

Continuing his search for the chief objects of interest in the new London, the visitor of the future may leave the new street at the point where it enters High Holborn, just by the Holborn Restaurant, and proceed eastwards along Holborn to the corner of Newgate Street and Old Bailey. On his way he may note on his left hand the new buildings of the Prudential Insurance Company, a reddish brown mass standing out with striking effect amidst its drab and grey surroundings, and on his right the new Birkbeck Bank. . . . .

Arrived in Old Bailey, he will find himself in the presence of another of the great architectural transformations that will mark the opening years of this century. In place of the famous old prison of Newgate, which is to be pulled down, will stand a stately domed building—the new Sessions House of the City of London.

The decision to build the new Sessions House on this particular spot is one which may have been necessitated by circumstances, but it is nevertheless to be regretted. For it means the disappearance not only of an ancient and historic landmark, but of one of the few thoroughly characteristic and satisfactory buildings of the Metropolis. Newgate is not beautiful as a palace is beautiful; were it so, it would be an architectural failure. But its grim and rugged outline proclaims its purpose—it suggests a prison to the least imaginative observer; and it has stood for more than a century as a material embodiment of the sternness, strength and dignity that are characteristics of civilised law. There is also a serious practical objection to this site—namely, that on it the new building cannot possibly be displayed to advantage. Like another building devoted to the administration of justice, the Law Courts in the Strand, it will inevitably suffer in appearance from the lack of a commanding site.

To continue further eastwards, the search for new objects of architectural interest might, perhaps, result in some disappointment. For although it is possible that the changes in the city east of St. Paul's will be not less considerable than those in the west, they are not likely to be of the same monumental character.



BALCONY ON GROUND FLOOR, PAVILLON DE MARSAN, THE LOUVRE, PARIS. LEFUEL, ARCHITECT. DRAWN BY H. F. COOKE. (*See p.* 22.)

There is no locality in London which gives promise of experiencing a more striking development in an architectural sense during the next few years than South Kensington, and a visit there in 1911 cannot but be an interesting experience. The character of the neighbourhood has for a considerable time been undergoing a change; and Thackeray, who lived in Young Street about the middle of last century, would hardly recognise in the Kensington of to-day, with its innumerable blocks of "mansion flats," the quiet old Court suburb that he knew. The visitor of the future, however, is less likely to be impressed by the increasing number of these Babel-like structures than by the fact that three more have been added to the already considerable number of fine public buildings in this favoured locality. Two of these, the Victoria and Albert Museum and the Royal College of Science, are buildings of the first importance, and in both cases the work of preparing the foundations is now proceeding vigorously. The third, the Royal School of Art Needlework, a building of some pretensions in the Imperial Institute Read, is much further advanced towards completion.

The observer of the changes which the first decade of the new century has wrought on the face of the city will not fail to take note of the greatest of all London's highways, the Thames. . . . . A new bridge at Vauxhall is now in process of construction, and another is to be built at Lambeth. The Vauxhall Bridge has been designed by Sir A. Binnie, late chief engineer to the London County Council, and is to be built of concrete, all the exposed surfaces except under the arches being faced with the whitest granite obtainable. From Lambeth Bridge to the Houses of Parliament the journey will be made by a broad new thoroughfare so planned as to give a fine approach to the Houses of Parliament. The Victoria Tower Gardens are to be extended right away to the foot of Lambeth Bridge, and the river embankment is to be continued, thus practically completing it from Blackfriars to Chelsea. The whole of the space now occupied by wharfage, and even some part over which the river now flows, will be added to the gardens, as the new embankment wall will be set out to the level of the existing one. . . . .

A little higher up the river, at Kew, a third new bridge will span the Thames. It has been designed by Sir J. Wolfe Barry, and is to be built of granite. It replaces a very picturesque, but very narrow and unserviceable, structure which has stood for more than a hundred years. The old bridge was only 24ft. between the parapets; the new one will be 55ft. There is a probability also that at some future time yet another bridge will be built in the city, somewhere between Blackfriars and Waterloo Bridges, to carry on the line of the Holborn-Strand street to the south of London. That, however, is an improvement which probably belongs to a more distant future than the time with which we are now concerned.

Masters and Men.

A Strike of Masons at Bridgend has occurred for an increase of ½d. per hour and acceptance by the masters of a code of regulations issued by the Masons' Society. As there are very few society men in the town, the masters feel confident that they will have no difficulty in filling the places left vacant by the action of the Masons' Union, and are determined to maintain their resistance.

The Hull Slaters and Tilers have come out on strike against the determination of the masters to employ labourers to do slaters' work. The employers have issued a statement to the effect that labourers are not employed by Hull slaters, and that the masters had no intention at any time to employ unskilled labour on slaters' work. It has been decided to close all the yards for a week for the purpose of receiving applications from old hands, and if the latter do not apply the employers will consider themselves free to fill up vacancies.

The Strike of Swansea Builders' Labourers is still going on. A conference was held recently, when the men offered to return to work at the old rate providing they receive a farthing advance per hour in November next and another farthing in May. The meeting stood adjourned, the masters promising to consider the offer. The masters now fully believe that resistance is only a question of time, and are advertising for men to fill the vacant places. The men do not see their way to concede everything after a seventeen weeks' strike, and the deadlock is thus being prolonged. So far as can be seen, however, it can only end in one way, as the men have been deserted by the skilled workers.

Dundee Masons.—An important agreement, affording a promise of industrial harmony in the Dundee building trade has been entered into between the masters and operative masons of the city. This section of the building trade has within recent times suffered from strikes and petty disputes involving a good deal of friction between employers and employees. The agreement referred to—the terms of which have now been accepted by both parties—provides that for a year, that is to say as from June last, no reduction will be made in wages. Having regard to the present position and prospects of the trade this provision has proved specially acceptable to the operatives. The interests of the masters are safe-guarded by a clause which will have the effect of prohibiting the calling out of men from the jobs of employers whose policy and actions do not coincide with the views of the union officials. Probably the most important feature of the agreement is a proviso for the appointment of an arbiter mutually chosen, whose decision in all matters of dispute will be binding on the signatories to the agreement.

The Dispute in the Bradford Building Trades has now extended over sixteen weeks, and the prospects of any settlement appear to be as remote as they were when matters were brought to a crisis on May 1st. Both employers and workmen are as firm in their attitude as ever, and to this extent the position of affairs may be said to remain unchanged, but in another aspect the situation can scarcely be described as so acute as it was in the earlier stages of the difficulty, from the point of view of either side. For some time past there has been a steady importation of non-society labour, until now, so far from building operations in the city being practically at a standstill, as was the case for some months, workmen officially stated yesterday to number two or three hundreds are engaged on several of the largest building undertakings. These include the Cartwright Memorial Hall, the Green Lane Board schools, the electricity extension works and the new Conditioning House. Mr. W. A. Forshaw, who has charge of the new labour bureau, reports that day by day a satisfactory number of applications are received, and that the new workmen are started as soon as their credentials are verified. He hazards the opinion that if the present rate of applications is continued the places of the trade unionists will have been entirely filled up in the course of another month or so. On May 1st the number of carpenters and joiners thrown out of employment was about 400, and the policy pursued has reduced the number on the books to 200. Similarly as to the masons the number on the books of the Bradford branch has diminished from about 500 to just over 300. It is stated that there is considerable activity in the building trade generally, and that in the great majority of cases the men have no difficulty in obtaining as much as 10½d. an hour, which of course is a penny an hour higher than the rate of wages upon which issue has been joined in Bradford. Some indignation has been aroused in the union by an assertion that its members are receiving a larger weekly allowance than their wages would ordinarily average in the course of a year. The allowance at the commencement of the dispute was 14s.; afterwards it was increased to 15s., and now so much support is forthcoming from other branches in sympathy with the Bradford men that the pay has been increased to 24s. a week, beyond which it is not likely to advance, however large the funds at disposal.

Street Improvements at Aigburth formed the subject of a Local Government Board enquiry into an application by the Garston Urban District Council for sanction to borrow £1,785.

Law Cases.

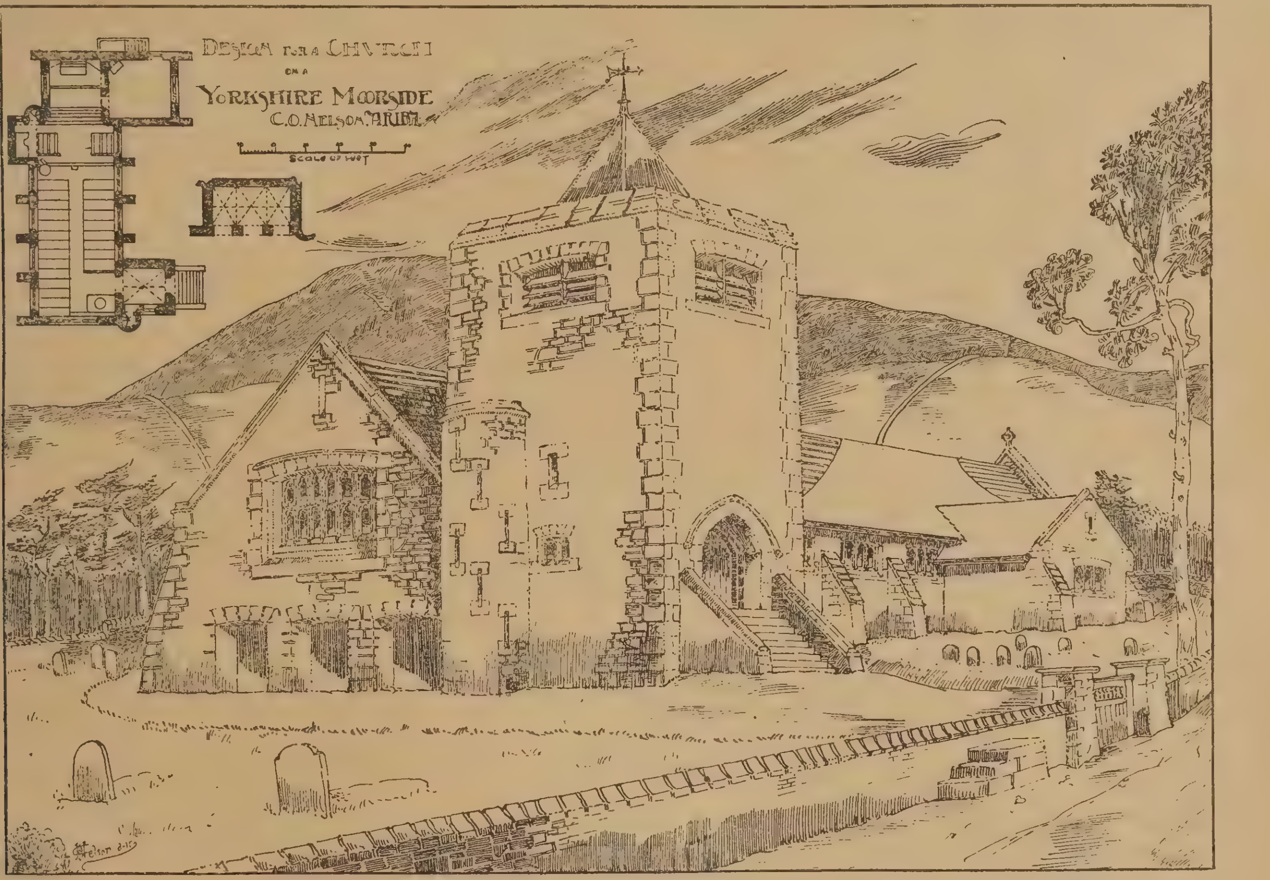
The Woking Drainage Scheme.—Mr. Herbert Weldon, public works contractor, of Birmingham, has just concluded a big drainage scheme at Woking, Surrey. The contract price for the work was £44,365, but before the scheme was finished the cost had run up to nearly £90,000. After concluding the contract Mr. Weldon made a claim of £10,000 against the Woking Urban Council for extra works performed, and the matter was referred to arbitration before Messrs. Taylor, Sons & Santo Crimp, of Great George Street, Westminster, the engineers. Mr. Weldon gave evidence in support of his claim. He said he had held an appointment under the Indian Government, and had had large experience in managing contracts for other people, finally starting for himself in 1892. During the three years he was working for other people he superintended £50,000 worth of work for the North-Western Railway Company, while since he had been on his own account he had done work of all classes amounting to nearly £500,000. Mr. Clement B. Ferry, who was Mr. Weldon's resident engineer at Woking, also gave evidence, and was subjected to cross-examination by Mr. Bray, K.C. The proceedings stood adjourned over the Long Vacation, but at a recent meeting of the Woking Urban Council a letter was read from Mr. Weldon's counsel suggesting a compromise for £2,275 18s. 9d., made up of £1,025 18s. 9d. which the arbitrator stated was due on certificates, and £1,250 which Mr. Weldon agreed to accept in settlement of his claim. The Council accepted the compromise. It was stated that the costs of the arbitration on both sides amounted to £100 a day.

The Building of a Cottage.—At the Chepstow County Court recently Judge Owen had before him an action remitted from the High Court brought by George Howell, a builder, of Woolaston, against George Robson, of Lydney. Plaintiff sought to recover £65 15s. 5d., balance of an account for building a cottage. Defendant counter-claimed £95, alleging that plaintiff deviated from the plans and also that some of the work was defective. It seemed that certain of the rooms should have been 8ft. 6in. high, but instead of that they were 4in. or 5in. lower; that the floor sloped an inch or two out of the horizontal; that some of the doors were warped and did not fit; and that there were faults with the roof and other parts. After a lengthy hearing his Honour gave judgment for the plaintiff for the amount claimed with costs. On the counter-claim he awarded defendant £10 in respect of the defective work (the estimated cost of making it good) and £25 cost for depreciation of the value of the cottage by reason of the rooms being made so low, with costs on £25.

Embezzlement by a Surveyor.—At the Northampton Divisional Police Court recently George Alfred Norton, until recently surveyor to the Hardingstone Rural District Council, was sent to prison for three months with hard labour for embezzling a small sum of money belonging to the council. The prisoner, who pleaded guilty, said he had been drinking heavily and had lost his wife. He had lost his situation and his character, and had tramped all over the country.

A Result of Speculative Building.—On Thursday last a meeting of creditors was held under the failure of J. J. Weibking, builder and contractor, of St. John's Works, Southgate, and elsewhere. It appears that the debtor, who filed his own petition, had large contracts on hand, one of which was for the erection of properties on the old Wood Green cycle track. The gross liabilities amount to between £40,000 and £50,000, of which £15,000 is unsecured, the assets being estimated to realise a surplus. The debtor attributed his failure to excessive building on insufficient capital, heavy interest on borrowed money, and inability to sell property owing to the war. The chairman pointed out that betting losses also had something to do with it. A committee of three creditors was appointed to investigate the debtor's affairs and report at the meeting to be held on August 30th.

Compensation Claim against the L.C.C. for Compulsory Purchase of Land in Westminster.—At the Westminster Guildhall on Wednesday last Mr. John Troutbeck and a special jury had before them the case of *Adams' Trustees* v. *The London County Council*, which was a claim for compensation for the compulsory acquisition of land in St. Anne's Street, Westminster, required for the extension of the council's gas-meter testing station. Mr. Freeman (for the claimants) said the premises had a total area of 6,100ft., and what was an important point was the fact that the site was not dominated by any ancient lights. The lease had 21½ years to run, and the jury would have to ascertain what was the present value of that unexpired term. Worked out on the usual scale, it would yield £699, and then they would have to take into account the value of the reversion. Several experts who had been consulted valued the 6,100ft. area at £5,970, to which should be added the 10 per cent. allowed for compulsory sale. Mr. William Henry Southon, a surveyor, of Cockspur Street, Charing Cross, said he considered the claimants were entitled to £7,336. Mr. Boyle (for the council) submitted, however, that the land was worth only £2,500 or £2,600. Mr. Samuel Walker, of Moorgate Street, a surveyor, said he considered the land and buildings on reversion were worth £250 per annum, of which he would give seven years' purchase. That would produce £1,750, to which had to be added £663, the present rental value, and 10 per cent. for compulsory sale, which would give them a total of £2,654. He considered that the full value. Mr. James Frederick Field, another surveyor, agreed with Mr. Walker's figures, which worked out at 10d. per ft. for the land and buildings. The jury awarded claimants £5,500, including everything.



Examination of St. Bride's Steeple.—The steeple of St. Bride's Church, Fleet Street, was recently examined by a steeplejack, on whose report the parish authorities decided that a thorough investigation should be made; its present condition is, however, in no way due to tubular excavation, but to the wear of time. The steeple is one of Wren's most graceful achievements. Originally it rose to the height of 234ft. In 1764 it was struck by lightning, with the consequence that the "soaring pile" had to be rebuilt to the extent of 83ft. Now it is about 5ft. higher than the famous steeple of St. Mary-le-Bow. The height of the tower to the top of the parapet is 120ft., and the spire rises in four octagonal storeys, of which the two towers are Tuscan, the third Ionic and the fourth Composite, the masonry culminating in an obelisk and vane.

A NOTTINGHAM FOUNDRY.

On the stretch of meadow land bounded by Meadow Lane, Nottingham, and the two Midland lines to Melton and Lincoln a new foundry works are being erected for the Midland Engineering Co., in consequence of their old works in Queen's Road being wanted by the Midland Railway Co. The building of the new establishment in Meadow Lane commenced last October. Three out of the eight acres of land which the company have at their disposal are to be built upon, the plans of Mr. W. B. Starr, the architect, providing for two main and several minor buildings. One of these big buildings—what is known as the large foundry—is now practically completed and is 200yds. long, 43yds. wide and 50ft. in height. Electrical cranes run along the huge girders near the roof; casting pits have been hollowed out the floor. Flanking this long foundry and in the same block of buildings are fitting shops, a gully foundry, an engine-room with two engines of 45 h.p. and 20 h.p. respectively, and a room containing the dynamos for the electric light. Light is obtained from expansive windows in the roof. Across the line of rails which connects the works with the Midland Railway, in the direction of Colwick, will be an even larger foundry than this. The contractor is Mr. James Wright, of Wilford Grove, Nottingham. This foundry will be utilised entirely for railway work, such as making plates and chairs and stops and all the other requisites of railway line-laying. The machine shop will be no less than 130ft. sq., though there is to be only one storey. The other departments will include forge shops and a boiler- and engine-house, while there is to be a chimney stack 50ft. high. On the opposite side—the London Road side—of the works will be erected stables and fitting and pattern shops, the total length of the building containing them being 280ft. The entrance gates will of course be on Meadow Lane, and here a frontage to the works 500ft. long will—though nothing has as yet been done with regard to this—contain the offices, the caretaker's house, and also mess- and cooking-rooms for the men engaged in the works. Before Mr. Wright could commence building in earnest the whole ground surface had to be raised by between 4ft. and 5ft.

Keystones.

The Parish Church of Llandenny will be opened, after extensive restoration, early in September.

A New Bridge at Paris similar to the splendid Pont Alexandre is to be erected across the Seine from the Louvre to the foot of Rue Bonaparte. The name proposed is "Pont du Louvre."

Hughenden Manor has been enlarged, the work having occupied between two and three years. Architecturally the mansion is of the Jacobean style, and the added portion has been executed in accordance with the existing fabric.

Harrogate Kursaal.—On page 18 of our last issue it was stated that Mr. Robert J. Beale, A.R.I.B.A., of Westminster, the architect of the new kursaal now being erected at Harrogate, will be responsible for the interior decoration and furnishing of the building. It is Mr. Frank Matcham (the assessor) who will undertake this portion of the work.

A Stained-Glass Window, erected in the collegiate church of Stratford-on-Avon, was unveiled recently. The window commemorates the heroism and sad death of Lieutenant Richard Fordham Flower, who was killed in South Africa.

Brighton's New Market.—The first of the new buildings with which the Markets Committee of the Brighton Town Council intend to replace the old market was opened last week. This is to be known as the Floral Hall, and is intended for the exhibition and sale of flowers and fruit. It is large, lofty and well lighted, and adjoins the present flower and fruit market. It is 145ft. long by 30ft. wide. The entrances are from Market Street and Black Lion Street, and the exterior elevation is in Ruabon terra-cotta, with ornamental curved-glass fronts. The walls are substantially built of red brick, and the glass roof rests upon arched girders resting upon decorated stanchions. The roof is glazed with patent glazing, shaded, and is surmounted with louvres with top lights. The floor is of red tiles. The ironwork is decorated in shades of French grey and the walls in salmon. At the south-east end suitable lavatory accommodation has been provided. The builders of the hall were Messrs. Rowland Brothers, of Horsham, whose tender was for £10,237. The architect was the borough engineer and surveyor, Mr. Francis J. C. May.

New Children's Home at Huddersfield have been erected on a site at Outlane. Mr. J. W. Cocking, of Cloth Hall Street, Huddersfield, was the architect. The cost has been about £2,100.

A New Connexion Church at Bridgtown, Cannock, is being erected on land adjoining the old chapel built in 1865. It will accommodate 500 worshippers, and will cost upwards of £3,000. The architect is Mr. Arthur Harrison, of Birmingham.

Fremiet, the distinguished sculptor, has just finished the model for his magnificent Eagle of Waterloo. He has also finished a fine statue of the Constable du Guesclin, which shows the conqueror of Montford on horseback, laurel-crowned, proud, thick-set, almost brutal-looking, such as history has painted him. This monument in bronze will be erected in Dinan this autumn.

The Buddhist Pagoda at the Paris Exposition and the marvellous subterranean grotto which had so great a success in the Indo-China section of the international show is ordered to be demolished. Artists and admirers of Eastern art had asked that these magnificent specimens of Oriental work should remain as a souvenir and as a manifestation of the artistic work of the men of the Extreme Orient which is daily penetrating into our civilisation.

Carrara Marble.—At Grognano, in the north of Carrara, has been discovered marble of various shades of red, black and gold which will make excellent decorations for hotels or public buildings. It seems that the method of extracting the stone from the quarries of Carrara is most primitive, not a single steam crane being in use. This system is commendable in so far as it means employment for many men, but it tends to keep up the price of marble, which is regretted by the struggling sculptor.

The Roman Camp at Gelligaer: Funds Needed.—Funds are in request to carry on the excavation of the remains of the small Roman camp at Gelligaer, Glamorganshire. The expense has been found greater than was at first anticipated, owing to the site having been crowded with buildings the foundations of which it is desired to explore thoroughly. The work has hitherto been carried out by the archæological section of the Cardiff Naturalists' Society. Contributions may be forwarded to Mr. John Stuart Corbett, president of the section, Castle Street, Cardiff.

A New Lunatic Asylum for Middlesex.—A Local Government Board enquiry was held recently into the application of the Middlesex County Council for the power to borrow the sum of £250,000 for the purposes of the new lunatic asylum which they propose to erect at Napsbury, St. Albans, Herts. The architect is Mr. Rowland Plumbe. There was no opposition to the scheme. Evidence was given to the effect that the asylum, which would be constructed to accommodate a total of 1,150 inmates, was estimated to cost £350,000. The loan of £250,000 for which consent was now asked was on account only of the general building. The site had been already purchased at a cost of about £50,000, and the foundations for the main building were rapidly approaching completion.

Proposed Museum for Fulham.—The Fulham Borough Council are to be asked immediately on reassembling to take into consideration the pressing need of providing a local museum. In consequence of the extensive building operations which are going on in the borough most of the historic buildings have been demolished or are threatened with demolition. From such buildings much might be saved which would form valuable links with the past, and much has already been secured by private enterprise. It is felt, however, that Fulham should follow the example of Chelsea and other boroughs, and secure either by purchase or loan as much as possible in one well ordered museum under municipal control. The matter is made urgent by the fact that the Free Library Committee have now the option of purchase at a mere nominal price of a unique collection of nearly 1,000 prints, drawings, maps, plans, deeds, pamphlets and other miscellanea relating to the parish. This would form an interesting nucleus, and the opportunity to acquire it intact is never likely to occur again.

At Port of Spain, Trinidad, a new church is proposed to be erected by the Roman Catholics.

St. Martin's Lane, W.C.—Some of the houses still standing on the east side are of considerable antiquity. One stated to have been built by Inigo Jones, in which he resided, is now used as a branch of the National Penny Bank.

A New Board School at Cleethorpes is being erected in Bursar Street at a cost of about £10,000. The new school will be a plain building, and is to give accommodation to 950 children—360 boys, 360 girls and 230 infants—while the premises will be capable of extension so as to accommodate 120 more infants if necessary. The architect is Mr. Croft, of Cleethorpes.

Improved Housing in St. Pancras.—Plans have been adopted by the St. Pancras Borough Council for the erection of blocks of industrial dwellings on cleared sites in Brantome Place, Euston Road, and Prospect Place, Gray's Inn Road respectively, providing accommodation for 584 persons, allowing two persons to each room. The total estimated cost of building is £32,367.

A Permanent Ruskin Museum is to be opened at Coniston, Lancs, on the 31st inst. as the result of a successful Ruskin Exhibition held there last summer. It consists of a large well-lighted room in connection with the Coniston Institute, and has been specially built and furnished for the purpose. The contents include numerous interesting and valuable articles contributed by Mr. and Mrs. Arthur Severn, of Brantwood, and by W. G. Collingwood, of Coniston; and the work of getting together and arranging these is being carried out by the latter gentleman, to whose efforts the successful organisation of last year's Ruskin Exhibition was mainly due.

The Northampton General Infirmary is to be practically reconstructed throughout the interior at a cost of £30,000. This was sanctioned at a recent meeting of the governors, when Sir Henry Burdett, the eminent hospital expert, in conjunction with Mr. F. W. Dorman, A.R.I.B.A., drew up a report in which two schemes were submitted. One scheme involved an expenditure of £21,000, and comprised the erection of a new home for nurses apart from the building, and certain additions and alterations. The other scheme which has been adopted is estimated to cost £29,500, and comprises the erection of two new pavilions, the conversion of the present infirmary into a home for nurses, and a rearrangement of some of the officers' quarters—practically a new hospital.

Mr. James Hutton, aged forty-nine years, a well-known Dundee architect, met his death recently at Montrose from drowning while out swimming. The deceased gentleman was born and brought up in Dundee, and served his apprenticeship as an architect in the office of Mr. William Mackison, burgh engineer, to whom he afterwards acted as assistant. About eighteen years ago he, however, commenced business on his own account, and had since established a wide and prosperous connection. Mr. Hutton was the architect for a number of public buildings in the city and elsewhere, including St. John's United Free Church and the People's Palace. Deceased took little or no interest in public affairs, although he was an enthusiastic member of the Dundee Institute of Architecture, of which body he was for a term president. For some years Mr. Hutton had resided in Invergowrie.

Mr. Robert I. Bennett, architect, of Manchester, died last Wednesday. For many years in partnership with Mr. W. A. Royle, he had been actively engaged in professional work. Thirty-five years ago the firm took over the business of the late Mr. Philip Nunn, an architect who, although young in years, had at the date of his death made a considerable reputation. Both members of the firm were pupils of Mr. Nunn. Mr. Bennett was held in high respect in his profession, and the members of the Manchester Society of Architects some years ago elected him as president. The firm of Royle & Bennett have during their long period of partnership carried out many important buildings in the city and neighbourhood, particularly schools, having erected for the Manchester School Board no less than ten buildings, amongst them the Higher Grade Schools at Cheetham. They also designed the School Board offices in Deansgate.

The Alfred Bevan Memorial Convalescent Home for men, women and children at Sandgate was opened last week. Mr. G. D. Stevenson, A.R.I.B.A., was the architect.

A Large New Residence at Frensham Hill, Rowledge, has been erected by Messrs. A. Estcourt & Son, of Gloucester, from designs from Messrs. Waller & Sons, architects, of the same city.

The Turners at the National Gallery have been rehung, and with good effect. The one or two great pictures which Turner himself hung, so to say, remain in the old position. They are in the French room, just to show, said Turner, how artificial a Claude, for instance, appears in comparison. But the greater number of the Turners have gained in every way by their new setting, and they are seen to more advantage than ever by their now magnified marginal spaces.

Municipal Schemes at Sunderland.—A Local Government Board enquiry was held recently into an application from the Sunderland Corporation to borrow a total sum of £34,920, this being required for three purposes, namely, £20,000 for the purchase of the Victoria Hall and some land adjoining, for the renovation and alteration of the hall and the erection of additional buildings; £3,920 for purposes of electric lighting in various parts of the town; and £11,000 for the reconstruction and extension of the public baths and washhouses in Hendon Road.

New Co-operative Stores are being erected in Durham Road, Birtley, by Mr. John Jopling, of Birtley, from designs prepared by Messrs. Liddle & Browne, of Prudential Buildings, Newcastle. The front of the building is to be of Ruabon red-facing bricks with stone facings, and it will have a frontage of 265ft. and a depth of 133ft. There will be eight shops on the ground floor, and on the first floor a large hall to seat about 900 people. Provision will also be made for club- and committee-rooms, with secretary's and cashier's offices, &c. The whole is to be lighted by electricity, and plant will be laid down for that purpose. The total cost of the new premises is estimated at £20,000.

St. Gregory, Weare, Somersetshire, has been undergoing restoration. Many interesting features have been brought to light in the process, though not so many remains of the Norman period as might have been expected. So far the old font and some zigzag moulding are the only traces of the architecture of that era which had been noted. The removal of the plaster from the walls of the sanctuary brought to light the ancient aumbry and piscina; and on the west side of the chancel arch was found the old doorway to the staircase leading to the rood-loft. Weare Church has suffered greatly in past times through injudicious renovations, and the east window, which is entirely out of character with the prevailing architecture, is to be replaced by one more suitable. Elsewhere arches originally of stone have been patched with brick, and these are being restored. The old oak seats are being remodelled, it is to be hoped in a conservative spirit.

The Century Theatre, which occupies the site of the old Adelphi, has been almost entirely rebuilt for Mr. George Edwardes, who holds a long lease of the house. The auditorium is entirely new, there is plenty of space between the seats, and as the circles are built on the cantilever principle there are no pillars to obstruct the line of sight. The stalls, numbering upwards of 200, are approached direct from the entrance hall. The dress circle has been brought forward, considerably enlarged and seats 170; the upper circle has also been extended and seats 250. The pit and gallery are very commodious, and all seats in these parts of the house have been upholstered. The prevailing scheme of the decorations is ivory white, yellow and old gold developed in silk velvet, with electric blue mural coverings and paintings. An asbestos fireproof curtain has been fitted, the theatre is heated on the low-pressure system and the ventilation has been carefully attended to. There is a complete installation of electric light, with gas as a stand-by. The exits are numerous and symmetrically placed, leading into wide and spacious corridors. The whole scheme of reconstruction has been designed and carried out by Messrs. Ernest Runtz & Co., architects, Mr. Frank Kirk being the contractor.

Mr. William Youings, the well-known statuary, of Bear Street, Barnstaple, died recently at the age of eighty years. He successfully carried on his business for half a century.

The Victoria Memorial Designs will be exhibited to the public in October. The plans were privately exhibited at the Foreign Office some weeks ago. During the interval the sketch model for the monumental group and fountains will be elaborated by Mr. Brock, the sculptor, and Mr. Aston Webb's architectural plans for laying-out the site, so far only seen in drawings, will be reproduced in plaster. If a model of Buckingham Palace and the proposed new roadway circling the garden is added, the public will have a good opportunity of judging what the great memorial will be like when completed.

The Chancel Arch of the Parish Church of Clopton, Suffolk, has until recently had its two stone corbels left in the rough state awaiting the sculptor's chisel. They have now been carved as a memorial to Miss Effie Garrod, youngest daughter of Sir Alfred Garrod. The corbel on the north side represents the Good Shepherd with the traditional lamb and crook and a setting of floriated carving. That on the south side depicts the Good Samaritan ministering to the wounded traveller. The cost of the work has been borne by Sir Alfred Garrod, Physician Extraordinary to Queen Victoria. Some improvements have recently been effected in the interior of the church at the expense of the parishioners.

The New Hospital at Newport (Mon.).—In our issue for August 14th last it was stated that this new hospital was designed by Mr. W. Tanner, and was built by Messrs. D. Richards, Ltd. We now learn that this is inaccurate. The hospital buildings were designed by Mr. Richard J. Lovell, architect, of 47, Queen Victoria Street, E.C., but he resigned in 1898, and his work was continued by Messrs. Pennington & Son, architects, of Hastings House, Norfolk Street, W.C. The building was erected by Messrs. A. S. Morgan & Co., builders and contractors, of 1, Godfrey Road, Newport, Mon., the work having occupied four years. The foundation-stone was laid on August Bank Holiday, 1897, and the buildings were formally opened on August 5th last. The total cost has been about £33,000. Lack of funds very much delayed the completion of the work.

The Memorial to the late Duke of Westminster in the Abbey.—At the present time Messrs. Burlison & Grill's workmen are removing the stained glass from the south end of the transept of Westminster Abbey to make way for the memorial to the late Duke of Westminster. The old work known as the marigold window dates from 1847, and is remarkable for the brilliancy of its colouring. The Duke's memorial will fill all the windows in the south wall of the transept. The design, which was recently exhibited in the Academy, has been supervised by Mr. G. F. Bodley, A.R.A. Great efforts will, if necessary, be made to finish the work before the Coronation. The process is a very tedious one, requiring great care in order to preserve the glass intact. Ordinary clear glass is being substituted, so that the work of putting in the new memorial window may ultimately be undertaken as a whole, and not done piecemeal as the old one is removed.

The Glasgow School Board Classes in Building Construction will open on Monday September 2nd, at the High School, under the direction of Mr. D. Bennet Dobson, architect. An additional feature of these evening classes this season is that students will have the opportunity of studying workshop practice in Kent Road School, as a branch department of the High School, the two classes working in conjunction with one another. The practical department is held on Mondays (advanced) and Tuesdays (elementary), and theoretical instruction is given at the High School, 30, Elmbank Street, Glasgow, on Tuesdays, Wednesdays and Thursdays. The fee for the theoretical is 7s. 6d. for a session of seven months and for the practical 1s. (inclusive of tools and woods) for eight months. Visits of inspection will be arranged to buildings in course of erection and works in progress showing the manufacture of material. Full particulars can be obtained from Mr. G. W. Alexander, 129, Bath Street, Glasgow.

Tuesday, September 3.

IRON AND STEEL INSTITUTE.—Autumn Meeting at Glasgow (First day).

INTERNATIONAL ENGINEERING CONGRESS.—Opens in Glasgow.

QUERIES ANSWERED

RESPECTING

Our Insurance Schemes.

From time to time we have queries addressed to us by readers on points affecting our Accident Insurance Schemes. The greater number of the queries relate to the conditions of payment, and to enlighten those who may still be in doubt we think it desirable to state

(1.) That it is not necessary to subscribe direct to the office in order to secure the benefits.

(2.) That even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.

(3.) It is sufficient to have an intimation from the newsagent that he supplies copies regularly.

(4.) That policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.

(5.) In applying it is not necessary to write a long letter—a postcard will do, giving the full name and address of the newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

Scheme No. 1 is a free Accident Insurance of **£500.**

FREE.

(*Every regular reader of the Builders' Journal is entitled to this without any payment.*)

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, Premium, £3/-/-

Hazardous Risks, Premium, £3/10/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

If these schemes interest you, write for full particulars to

THE MANAGER OF THE
BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,
STRAND, W.C.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Aug. 30	Denbigh—Additions to Asylum	Committee of Visitors	T. M. Lockwood & Sons, Foregate Street, Chester.

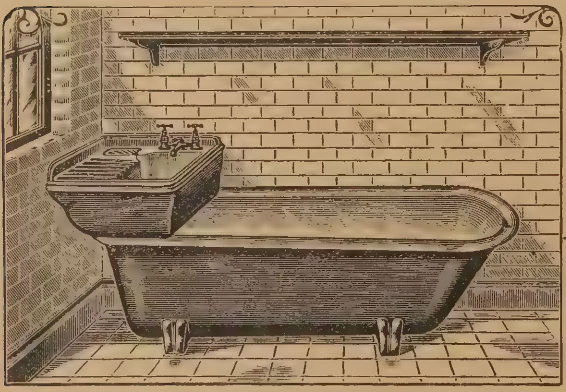
480, HARROW ROAD, PADDINGTON, W.

MORRISON & INGRAM'S
. . BATHS. . .



THE PATENT BRAMSTONE COMBINATION BATH & LAVATORY.

The success of the Bramstone combination justifies its introduction, and proves the need for the same.

It is now recognised that no house, however small, should be without bath and lavatory; and since an additional rental is needed of but 2d. per week to yield 5 per cent. on the outlay consequent upon the introduction of the cottage Bramstone Bath, this reform may now be deemed within the reach of all.

It affords economy of space, and a great saving of plumbing is effected.

Only one installation of hot and cold pipes required. It is also made for cold water only. Baths are made 5 ft., 5 ft. 6 in. and 6 ft. long. Prices from £3 11s. 8d. gross.

MAKERS OF ALL KINDS OF BATHS, LAVATORIES, WATER-CLOSETS, URINALS, SINKS, &c., &c.

Catalogues, Prices and Schemes of . . .
. Sanitary Fittings supplied on application.

An Architectural Causerie.

Building as an Amenity.

WE have a proverb to prove that necessity is a very genuine mother. The good people at Christ Church, Northampton, who built their own school and parish room, when gentlemen well-known in local business circles might have been seen strutting about with hods on their backs; the Cumberland clergyman and his daughters who built their rectory from bottom to top; and the other vicar who, finding money short, painted the schools himself—all these testify to that proverb: and it is rather singular also that this amateur workmanship should be associated with churches, calling to mind those well-meant though most prosy speeches made by divines who are invited to the dinners of architectural societies—poor William of Wykeham to wit! And speaking of this matter reminds us of the visitor to an old church who, on examining the pews, remarked that they seemed to contain a lot of dry rot. "Ah!" said the verger, "but it's nothing to what we have in the pulpit." Nevertheless, whatever may have been their powers for or against somnolence when in their pulpits, the builder-clergymen to whom we first referred certainly deserved credit for the practical way in which they met their difficulties. But all the foregoing concerns men; now we have an instance of boy builders, of which full particulars will be found on page 53 of this issue. Some readers may recollect the case reported in these columns a year or so ago of two boys who occupied most of their spare time in dropping pieces of brick and stone into the lime (and damaging the other material) which was to be used in the repair of their father's house. Being a typical Englishman, the father said that "boys would be boys," and the judge, being a typical English judge, fined him ten guineas. Those boys were the raw material. But at Felixstowe you can see boys under control working on their new institute, of which a room 40ft. by 24ft. is being erected for the present. There is a village club and reading-room in Old Felixstowe, but the adult members cleared the place of boys, who roamed here and there till some ladies lent a helping hand. The use of the local Board school was secured, and here the numerous classes (including carpentry, building construction and carving) were conducted till space became too limited. It was then that the present scheme received its inception. In a short time the land, the plans, the materials, the scaffolding, the roof work, the carting, and even the installation of the electric light had all been promised, and now many busy hands are at work. Most of the boys have stuck well to their self-imposed task; their friends, including one member of the district council at least, have from time to time dropped in to lend a helping hand; one of the ladies even has been seen on top of the scaffolding engaged in the rough task of laying bricks; and it is said that a visiting clergyman — now indisposed, unfortunately — evinced such an active interest in the work that he went through a brief apprenticeship to the business, starting right from the elementary task of learning how to mix mortar (is not this another instance of the unity between the Church and building?). The work is necessarily not without flaw, but it is solid enough to withstand the weather, and that is all that can be expected. One hears so much talk nowadays—even among architects—that a little practice comes quite as a relief. Amateur building as a fad is not to be encouraged; but when it becomes the only means of solving a difficulty we think that those who practise it under technical guidance certainly deserve praise, and none more so than these boys of Felixstowe and those several gentlemen who are directing their labours.

Mr. Alfred Waterhouse.

WE are glad to be able to announce an improvement in the general condition of Mr. Alfred Waterhouse, who for some time past has been lying ill of paralysis at Yattendon Court, his country house in Berkshire; and we trust that he will now speedily recover. Mr. Waterhouse is one of the few members of his profession who practises painting. In last year's Academy he exhibited a large study in oil of a Berkshire country road, painted near Yattendon. Mr. Waterhouse is the holder of one of the highest offices in the Royal Academy, that of treasurer, a post he has filled since it was resigned by Mr. Horsley in 1898. At Yattendon Mrs. Waterhouse, who shares her husband's artistic sympathies, directs, in connection with the Arts and Industries Association, a large class of amateur workers in brass, pewter and copper *repoussé*, some excellent examples of which were shown at the May Exhibition in the Royal Albert Hall.

LOUGHBOROUGH CHURCH

DRAWN BY E. STANLEY MITTON.

IN AND ABOUT WENSLEYDALE.

BY J. TARNEY.

IN a little village called Carperby, in the centre of a Yorkshire dale, we spent a fortnight of fine days. In these days a particular breed of sheep and a noted make of cheese are the products chiefly associated with Wensleydale, and curiously enough this celebrity for cheese-making is quite a survival of the Middle Ages, as we read that "the monks of Jervaulx (Abbey) at the eastern extremity of the dale were in the olden days noted for their breed of white horses, their singing and the making of cheeses." Wensleydale, however, possesses examples of ecclesiastical, monastic and military architecture which though unable to compete in grandeur with other portions of the county—at any rate as regards the first two—yet are well worthy of examination; added to this the great beauty and variety of its scenery, which the great Turner found worthy of his pencil, combines to render Wensleydale a desirable and happy "hunting ground."

Approached from Hawes Junction at the west of the dale, Carperby, our headquarters, is situated about a mile from Aysgarth Station. It consists of one long straggling street with a rude sort of cross in the midst, dated 1675, standing elevated upon seven steps about 9ft. from the ground; there is nothing else of interest about the village, but it forms a good centre. From there we visited Askrigg and Nappa, Redmire and Castle Bolton, Wensley, Middleham and Coverham, Jervaulx and Spennithorne.

The beauty of Aysgarth is exquisite, with its waterfalls and acres of wooded expanse, in the summer redolent with the perfume of the wild rose, which grows in luxuriant profusion; and in the autumn one glowing mass of russet and gold, thrown up against the dark background of Penhill, with the tower of the church forming a dominant point in the landscape.

With the exception of the lower portion of the tower, the church has been entirely rebuilt. The chief object of interest here is the fine rood screen said to have been brought from Jervaulx Abbey, in an undivided state, by twenty men shoulder-high—a not inconsiderable feat considering the distance is fourteen miles. This, occupies the south side of the choir; it is of oak with elaborate carving and groined cove, and has been painted and regilded. On it is cut the following inscription: A.S. ABBAS. ANNO D'NI 1536.

The initials are supposed to be those of Adam Sedburgh, abbot of Jervaulx, who was hanged in the same year that the "old" church was restored for the part which he took in the rebellion. The elbows to the prayer desk are very fine and richly carved with heraldic devices, &c.; they evidently form part of the set of stalls from St. Agatha's Abbey at Easby, the remainder of which are at Wensley Church. They are cut out of solid oak 5in. thick, with battlemented buttresses surmounted by animal figures and fine poppy heads. On one elbow, surmounted by a crocketed canopy, are the mitre and crozier, underneath which is a shield bearing the initials H. M., probably a former abbot. Aysgarth village is about a mile away, of no special interest except for the fine views from its elevated street.

Four miles west from Carperby is the quaint market town of Askrigg, and within one mile you discover Nappa Hall, snugly ensconced under the lee of the wooded scar, where the ground falls away so rapidly that the roofs and chimneys are on a level with the high road. You enter through a gateway in the stable wing into a courtyard grass-grown and quiet. On the left is the main building, consisting of two embattled towers of unequal height, connected by an intermediate building which was formerly the great hall, and which is lit by mullioned windows with cusped heads. The building is in good preservation, though the old panelling and furniture have all been removed. The parlour, now used as the farm kitchen, still retains its fine oak moulded beams and joists forming the ceiling. Nappa Hall, according to Leland, was built by one Thomas Metcalfe, who was "yn those quarters a great officer, as steward survien of receyvor of Richmont landes, whereby he waxed riche and able to build and purchase." In the first year of Richard III. he was made Chancellor of the Duchy of Lancaster and a Privy Councillor, and lived through the reigns of Henry VI., Edwards IV. and V., Richard III. and Henry VII. From an historical point of view Nappa is also interesting from the fact of its having entertained Queen Mary of Scots when she paid a visit to Sir Christopher Metcalfe and passed two nights there in 1569. Here also King James I. was entertained by Sir Thomas Metcalfe, known as "the Black Knight of Nappa," when he visited this and the adjoining dale (Raydale) for the purpose of stalking deer.

There is a quaintness and picturesqueness about the quiet grass-grown streets of Askrigg which is very pleasing: "Drunken Barnaby" in his "Journal of Adventures" thus describes the place:—

> "Thence to Askrigg market noted,
> With no handsomeness about it;
> Neither magistrate nor mayor
> Ever was elected there," &c.

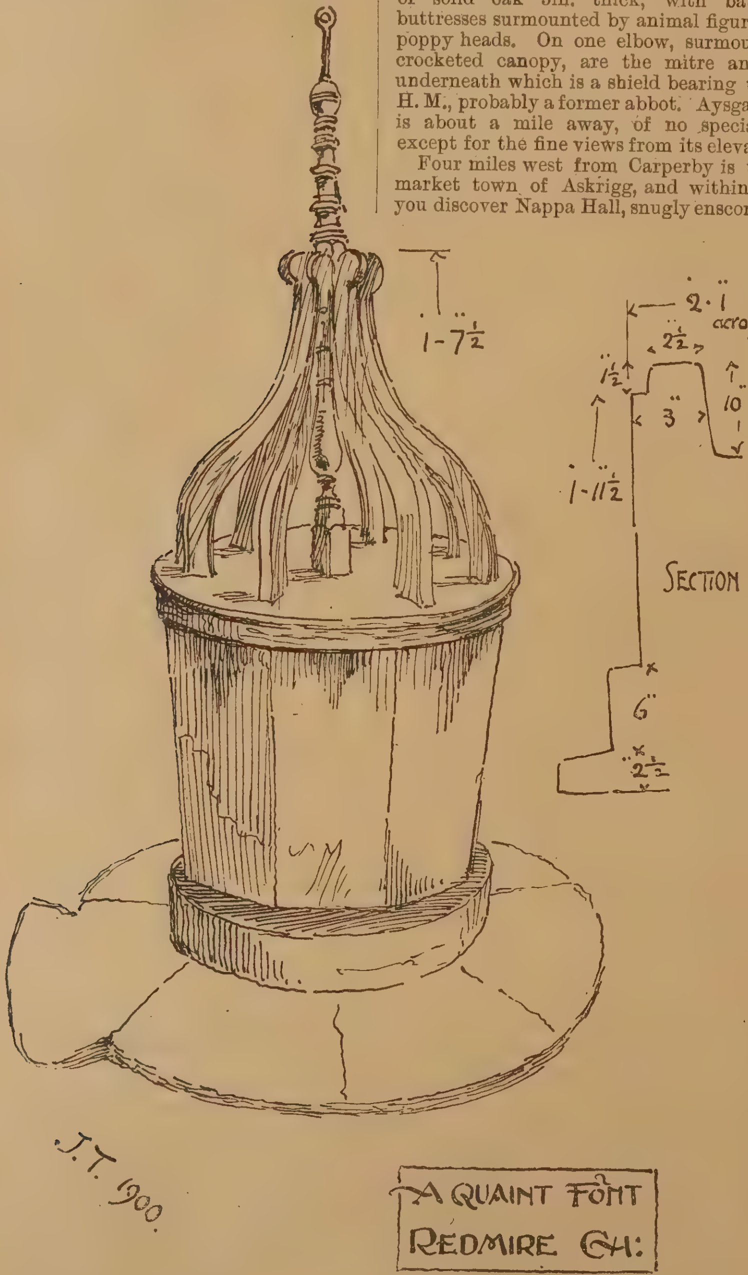
"Drunken Barnaby" was evidently no judge of architecture, for facing the stone Market Cross stands a fine-gabled and many-mullioned house, known as the house of the Thorntons, rising straight out of the street, with its gardens lying behind. This house forms the chief centre in Miss Jessie Fothergill's novel "Kith and Kin," where it is faithfully delineated. It has two doorways, with heads of the type peculiar to North Lancashire and the Yorkshire borders, and the following inscription is cut over one of them:—

"Gulielmus Thornton posuit hanc Domum MDCLXXVIII omnie enim domus A. P. paratur. Agliopiam ru vero contraluit haec omnia est Deus. Heb. 3, 4."

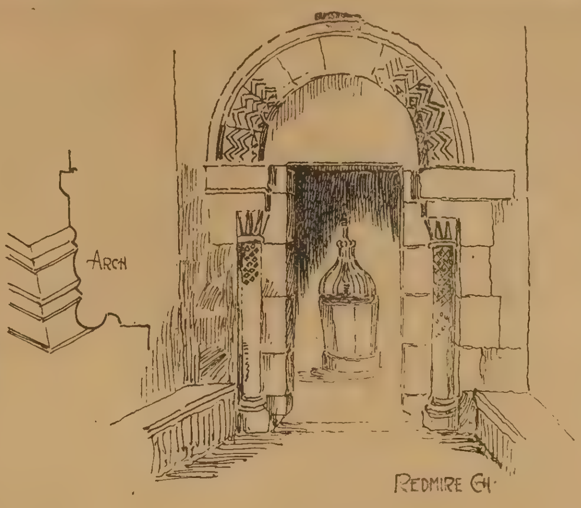
The ruined castle of Bolton soon becomes visible after leaving Aysgarth to the east—standing four square, with its grey towers against the russet and purple of the moors behind. A nearer view shows the almost complete aspect of the exterior of the castle, which Parker in his "Domestic Architecture" describes as "one of the most perfect baronial residences remaining in England." It would be difficult to imagine a more pleasant day than one spent in rambling about its walls and the little hamlet which nestles under them. The houses, with their thatched and stone-slabbed roofs, are clustered round a green which is enclosed on the west by the castle and diminutive church.

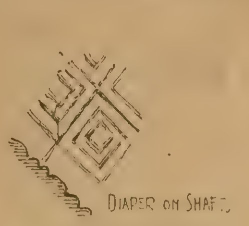
The castle consists on plan of four lofty towers, each connected by a curtain, forming a quadrangle or courtyard. The sides vary in length, the north measuring 187ft., the south 184ft., the east 125ft. and the west 131ft.; and this singular irregularity is carried out in the towers, the north and south sides measuring 47ft. 6in. and the east and west 6ft. to 7ft. less in the square. The walls, 7ft. thick, are 96ft. high. The gateway—narrow, tall and plain—is in the east curtain close to the south-east tower, and has been defended by a portcullis. It gives access to a courtyard, from which four doors, each formerly strongly defended by double portcullises, communicated with the castle. The grand hall was on the south, the chapel on the north side.

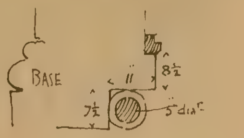
The castle was built by Richard, Lord Scrope, Chancellor of England and Keeper of the Great Seal, in 1379. According to Leyland it took eighteen years to build, and cost £12,000. Of it he also says: "Most part of the timber that was used in building this castle was felled in the forest of Engleby in Cumberland, and Richard, Lord Scrope, for the conveyance of it, had laid by the way divers draughts of oxen to



A QUAINT FONT REDMIRE CH:







carry it from place to place until it came to Bolton."

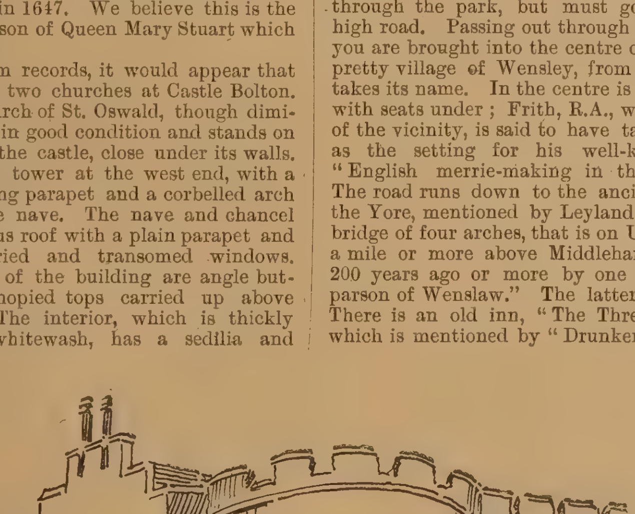
One is led to wonder, when looking at the massive masonry of the walls and the area of the building, what the cost might have been if erected in these modern days of rising prices and trades unions, &c. The historical associations of Bolton throw a halo of romance about it, which makes it doubly interesting; for here, in the early autumn of 1568, Queen Mary Stuart was brought by Lord Scrope, to whom she had surrendered at Carlisle, and by the order of Elizabeth kept a prisoner until the time that Fotheringhay looked its last upon her. Mary was confined in the south-west tower, and the window is still shown in the west front from which she is said to have escaped previous to her re-capture on "Leyburn Shawl," a beautifully wooded natural terrace near Leyburn, which still retains the name of "the Queen's Gap."

The castle was defended against Cromwell by Richmondshire Militia under Colonel Scrope, and afterwards under Colonel Chaytor, until, like the gallant defenders of Ladysmith and Mafeking, the garrison was reduced to eating its own horses. By order of the Parliament it was dismantled in 1647. We believe this is the only English prison of Queen Mary Stuart which is still standing.

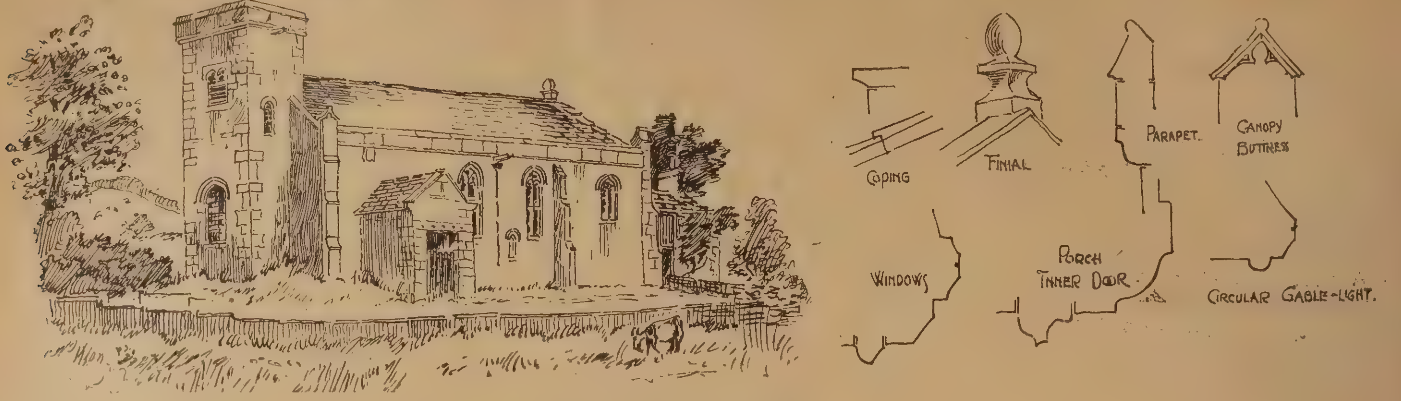
Formerly, from records, it would appear that there have been two churches at Castle Bolton. The existing church of St. Oswald, though diminutive in size, is in good condition and stands on the west side of the castle, close under its walls. It has a Norman tower at the west end, with a plain overhanging parapet and a corbelled arch opening into the nave. The nave and chancel have a continuous roof with a plain parapet and curiously traceried and transomed windows. At each corner of the building are angle buttresses with canopied tops carried up above the parapets. The interior, which is thickly coated with whitewash, has a sedilia and credence and two niches, one on each side of the east window. On the south side is a porch, the outer doorway of which is a plain square opening lintelled over by an oak beam having square pateræ sunk on the face.

Redmire, the next village to Bolton, is not architecturally interesting. The church, which is dedicated to the Blessed Virgin, stands some way off at the entrance to the park of Bolton Hall, the seat of Lord Bolton. It is a small Norman edifice with Early English and Decorated additions, and still retains its old oak roof, but the church has been fitted with commonplace pitch-pine fittings which are entirely out of keeping, and the quaint old font with its painted wooden cover seems to stand as a silent protest against them. The south doorway is a good example of Norman work, and also the bell gable which, however, is minus its cross. Leaving the church, we continue through the park under beautiful old trees with the river near winding along through the charming woods until the front of Bolton Hall is reached. Built in 1678 after the castle became untenable, it consists of a centre and two wings of no particular interest. It may be as well to warn cyclists that they are not allowed to cycle through the park, but must go round by the high road. Passing out through the lodge gates you are brought into the centre of the prim but pretty village of Wensley, from which the dale takes its name. In the centre is a huge elm tree with seats under; Frith, R.A., who was a native of the vicinity, is said to have taken this green as the setting for his well-known picture, "English merrie-making in the olden time." The road runs down to the ancient bridge over the Yore, mentioned by Leyland as "the fayre bridge of four arches, that is on Ure, at Wensley, a mile or more above Middleham, made about 200 years ago or more by one called Alwine, parson of Wenslaw." The latter died in 1430. There is an old inn, "The Three Horseshoes," which is mentioned by "Drunken Barnaby" in his "Journal of Wanderings." The church, dedicated to the Holy Trinity, is perhaps the most interesting in the dale, and is rich in heraldry. The church dates from the twelfth century (about 1190), with additions and alterations in the fifteenth. On plan it consists of a west tower, nave and aisles, chancel, vestry on the north side with a room above, and north and south porches. The tower, which is massive and dated 1719, is in the debased style of that period, as also are the west windows of the aisles. The south porch has a sundial above the doorway with the inscription: "It's a shadow, so is life." Along the outside of the east wall of the chancel is a stone seat, which is somewhat curious. All the buttresses are carried up above the parapets and terminated by battlemented square tops; in the face of the buttresses are shallow square niches with ogee heads with drip stone and heads for terminations The niches are filled with shields of arms as follows: (1) Scrope, (2) Fitzhugh, (3) Scrope of Masham, (4) Nevile, (5) De Ros, (6) Scrope of Masham impaling Montacute, (8) De Ros, (9) Scrope, (10) A fess between three roses, (11) De la Pole. The nave is lofty and without a clearstory, the arcade measuring 12ft. 4in. to top of cap and the piers 16ft. 5½in. apart. The chancel is Early English. On the south side are three sediliæ and three windows (the first blocked up), all ornamented on the inside with the dog tooth in the jambs and arch. The second window is curtailed to receive the priest's door, and the third is the lychnoscope, transomed and carried down below the sill of the other windows. The stalls in the choir are superb in design and execution, and are said to have been brought from St. Agatha's Abbey at Easby, probably by John, tenth Lord Scrope of Bolton. They stand before the chancel screen and along the north and south walls of the choir, and have richly-decorated elbows with poppy-heads of very spirited design. The fronts are divided into panels, each bearing a shield with a portion of the following inscription cut in letters of good character: "Hen ri cus Ri che rd son huic Rec tor hos fe cit Sup tus Dñi M° CCCCC° XX° VII° So li Dei Ho nor et glo ri a." In front of the poppy-heads are figures of animals chiefly heraldic. Commencing at the south-east: (1) a wyvern, (2) bear, (3) lion, (4) griffin, (5) hare, (6) unicorn, chained. The execution of the hare especially is very spirited and life-like. Two bench ends have achievements: (1) The arms of Scrope and Tiptoft, with helm with open bars, and two Cornish choughs as supporters, (2) Scrope and Tiptoft, quarterly impaling Dacre and Warren; beneath, the initials H. R. The woodwork at the east end of the north aisle is a portion of the parclose of the Scrope chantry from Easby Abbey, and is crowded with heraldic bearings giving the alliances of the house of Scrope. The Perpendicular work is, however, set behind some poor Renaissance work, the whole forming the Bolton family pew.

There is a fine marble slab in the north aisle bearing the effigies of a male and female of the Scrope family and dated 1525. In the nave pavement is a stone with an inscription round it of the exaggerated size of 8ft. 2in. by 6ft. 2in. The most remarkable of the monuments in the church, however, is the magnificent full-length



SPENNITHORNE HALL.

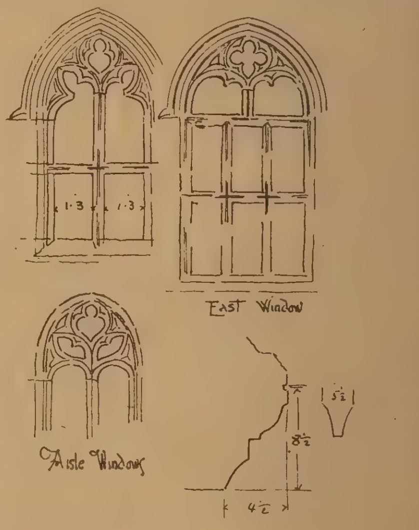


CASTLE BOLTON CHURCH.

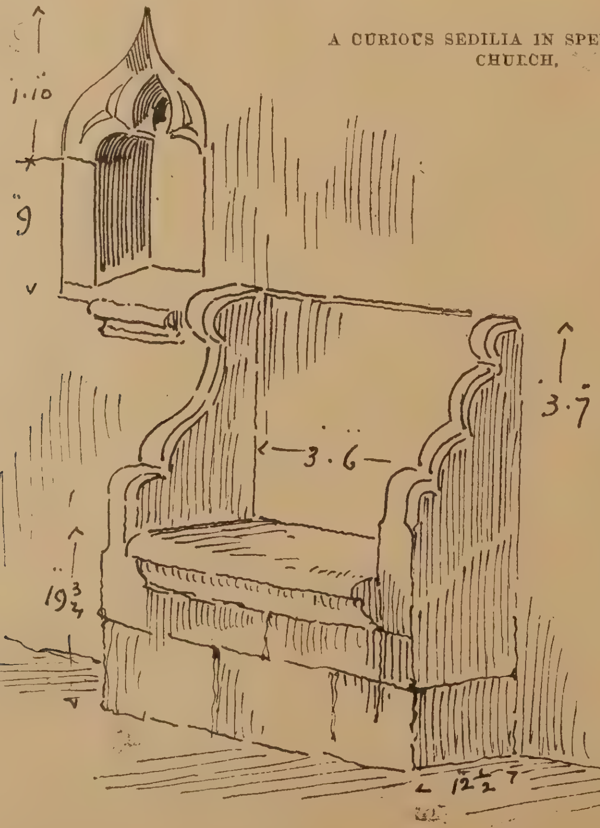
brass of a Catholic rector or warden in complete vestments, with the veiled chalice above his crossed hands. The inscription is removed, but the name is known to be that of Sir Simon de Wenslagh, rector 1390, from the will of Oswald Dykes, rector in 1607, who desired to be buried under this stone, and an inscription concerning whom is let in at the head of the brass, to its injury. This economical form of perpetuating their memory seems to have been frequently practised by our ancestors, as one has often heard of brasses found to have been turned over and re-used, but the above is a very glaring example, possibly more one of religious zeal than of miserliness, the memorial being to a Catholic rector. The east window contains some old glass chiefly heraldic. Evidence of the former existence of a Saxon church is given by a stone built in the north aisle wall, which shows a cross with two birds in the top corners and two dragons in the lower. Beneath, in Saxon characters, is the name DOMFRID. The nave and chancel have their old oak roofs, but the aisles are ceiled in plaster, and the whole church is coated inside with whitewash and paint and is badly in need of careful restoration; the fact, however, that the old oak altar-rails had recently been newly painted and grained augurs ill for any intelligence in this direction. There is a quaint double-decked pulpit and desk of late character and old pews and benches in the nave and aisles of oak; also a font of sixteenth-century workmanship.

Middleham, one mile from Wensley, is a curious mixture of large village and small country town, and was once the "capital" of the dale, a charter for a weekly market having been granted by Richard II. in 1388. Two market crosses still remaining attest this fact—one, comparatively modern, and the other, which is known as the Boar Cross, having a rude representation of a boar standing on the north side, the cognisance of Richard III. The town is dominated by the ancient castle, under whose ruined walls the houses are closely crowded. The ruins are very extensive, occupying a space of 210ft. by 178ft. and flanked by a square tower at each angle. In the centre of the grass-grown enclosure is the Norman keep built by Robert Fitz Ralph about 1190, around which are grouped the buildings of the Nevilles, erected to accommodate their vast train and to support their princely habits; for when residing at Middleham the Nevilles were at the zenith of their power, and the castle became renowned throughout the land for its hospitality and vast entertainments. To give an account of the historical associations of the castle would take up too much space; suffice it to say that here was brought a prisoner, Edward IV., by the great baron, the last of the Nevilles in the male line, and also the greatest—Richard, Earl of Warwick and Salisbury, known as the king-maker, Lytton's "last of the Barons." Middleham was also the favourite residence of Richard III., the son-in-law of Warwick.

The parish church has been restored. Dedicated to the Blessed Virgin and St. Alkelda, its general character is Decorated, with later insertions: the plan is made up of a nave, aisles and chancel, west tower, south porch and vestry. On the south side of the tower is a window which looks towards the castle, and the arrangement of the interior of the tower in the storey to which it belongs leads to a suspicion that this was at least a watch tower, if not a chamber of defence, connected with the military works of the castle; for it is obviously intended at least as a temporary residence, being furnished with a fireplace. Richard III. made the church collegiate, with a dean and six canons. One of the canons of modern times was the Rev. Charles Kingsley. The tower arch is lofty and the west window good Perpendicular. On the north wall inside the tower is the sepulchral stone that once covered the coffin of Robert Thornton, twenty-second Abbot of Jervaulx and Dean of Middleham, and is remarkable for his rebus elaborately and beautifully carved upon it. At the foot of the stone is a "Tun," out of which issues a thorn tree, forming the rebus Thorn-ton, which fills the stone with its innate ramifications; surmounting the Tun is a mitre and crozier, and at the sides are the initials R.T. Two shields at the top bear the sacred monogram. Round the border of the stone runs this legend, each word divided by a thorn leaf: "Orate · Pro · a'i'a Dompni · Roberti · Thorneton · Abbat · Sc'di." In the west window of the north aisle are some fragments of old glass. This aisle, which retains its old oak roof in good preservation, is, however, greatly disfigured by the wretched gallery which blocks up the arches. Passing through the town and mounting the rising ground, you presently emerge upon the wide moorland, well-known as a training ground for racehorses. From here the Vale of the Cover is spread out before you. On the opposite side is Braithwaite Hall, an early seventeenth-century structure, now a farm. One room is panelled to the ceiling, with a carved oak mantel and secret door and passage. On the north side of the river near the bridge are the remains of the Abbey of Coverham, which was founded in 1214 as a home for white canons by Ralph Fitz-Robert, a descendant of Ralph de Glanville, some time Lord Chief Justice of



CASTLE BOLTON CH:



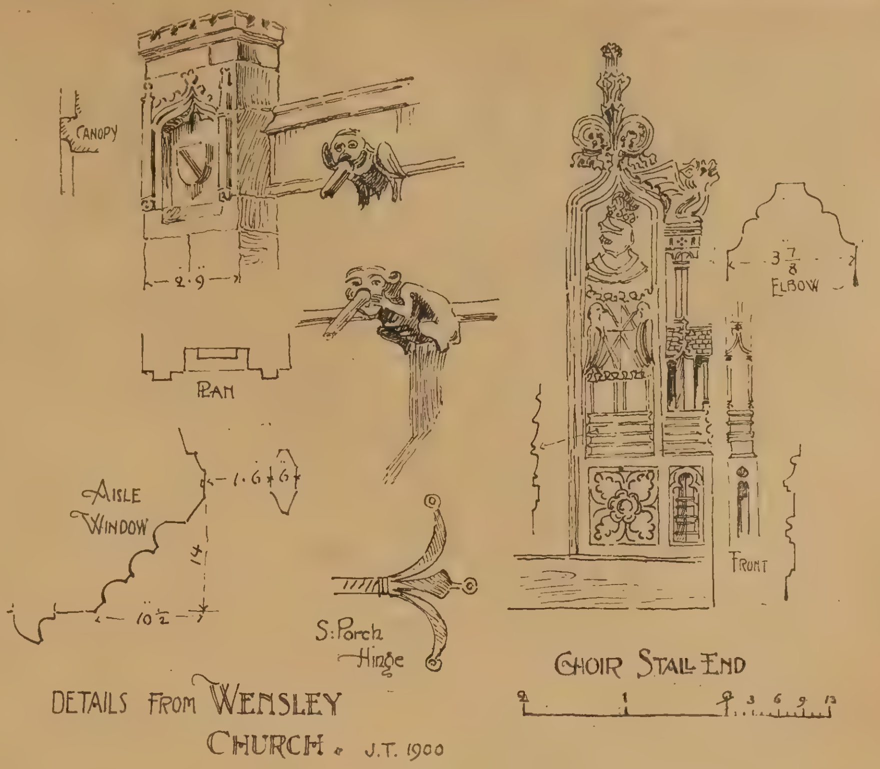
A CURIOUS SEDILIA IN SPENNITHORNE CHURCH.

England. The remains of the church show it to have been not a large, but a very graceful, Early English fabric. Two arches of the nave of the Decorated period remain, and also part of the abbot's lodgings and the Norman entrance gateway. The abbot's lodgings have been converted into a dwelling-house, and the gardener of the owner is constantly unearthing carved stones and coffin lids; indeed, just before we were there he discovered a very fine stone coffin in perfect condition, of which there are many specimens about. Two very singular cross-legged sepulchral figures are reared against the wall of the adjoining garden. One of them is the very remarkable figure of Ralph, son of Robert Neville, showing the figure surrounded with a stag and hounds in full chase. He was buried in the choir in 1331. There are many inscribed stones and monograms inserted in the wall of the old abbey buildings, mostly of the same date and late workmanship, and which seem to point to a fondness on the part of some individual for working the sacred monogram, &c.

A very fine altar stone, which has been brought from this abbey, is built into the wall near the entrance at "Bear Park," Aysgarth, the seat of Mr. T. Bradley. The sacred monogram, &c., with figures of angels and the emblems of the Crucifixion, are here employed, with an inscription below part of which is worn away. "Bear Park" is in the Tudor style, but has been not very carefully restored; it has, however, very fine panelled oak rooms, furnished with beautiful old furniture which the owner takes a delight in collecting. This house was formerly the seat of a younger branch of the Metcalfes of Nappa. The garden is tastefully laid out, mostly with Alpine plants, and very fine views of the river and woods are here obtained, the house being situated just above the High Falls.

Returning to our journey at the east end of the dale, three miles from Middleham on the south bank of the Yore, and almost at the extremity of the dale, stand the remains of the Cistercian Abbey of Jervaulx or Jorvalle.

The unerring instinct of the monks of old in finding the richest, most beautiful and sheltered sites for the foundation of their abbeys seems to have stood them in good stead in this case, Jervaulx being set in a charming vale, fertile and well-wooded, with the indispensable river flowing close by.

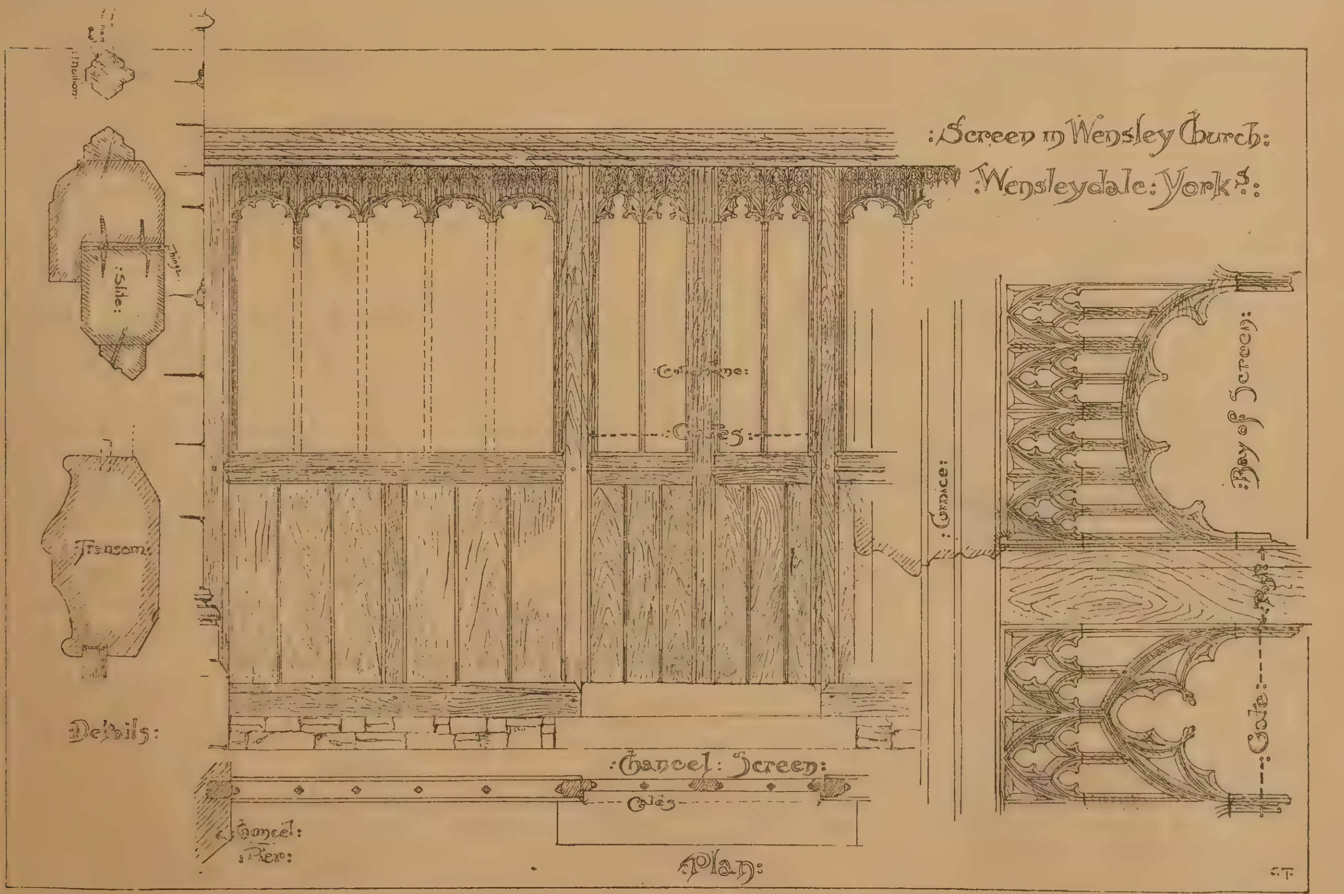


DETAILS FROM WENSLEY CHURCH. J.T. 1900

The original founders of the abbey were some monks from Savigny, who, having obtained a gift of land near Bainbridge (at the west end of the dale) founded the Abbey of Fors, now disappeared, in 1144. They removed to Jervaulx in 1156, when the abbey was built. There were in all twenty-three abbots, John de Kingstone being the first, and Adam Sedburgh, who was executed in 1537 (see Aysgarth Church), the last. The abbey was destroyed in 1538 by order of Henry VIII. The church was razed almost to the ground, but is so exactly marked out by the bases of the pillars and the few courses left on the walls that we might almost fancy the masons had just left the walls above the foundation There are several flat monumental stones extending along the centre of the nave, with beautiful foliated crosses and inscriptions as sharp almost as if recently cut.

More remarkable than these is the stone altar in the north transept, standing upon two steps, perfectly entire and a rare example. The dimensions are: Height 3ft. 3in., length of top 6ft. 3in., breadth 3ft. 3½in. The steps only of the high altar remain, but there have been five others, including one in the south transept similar to the one in the north.

The church measures 270ft. long, 113ft. across



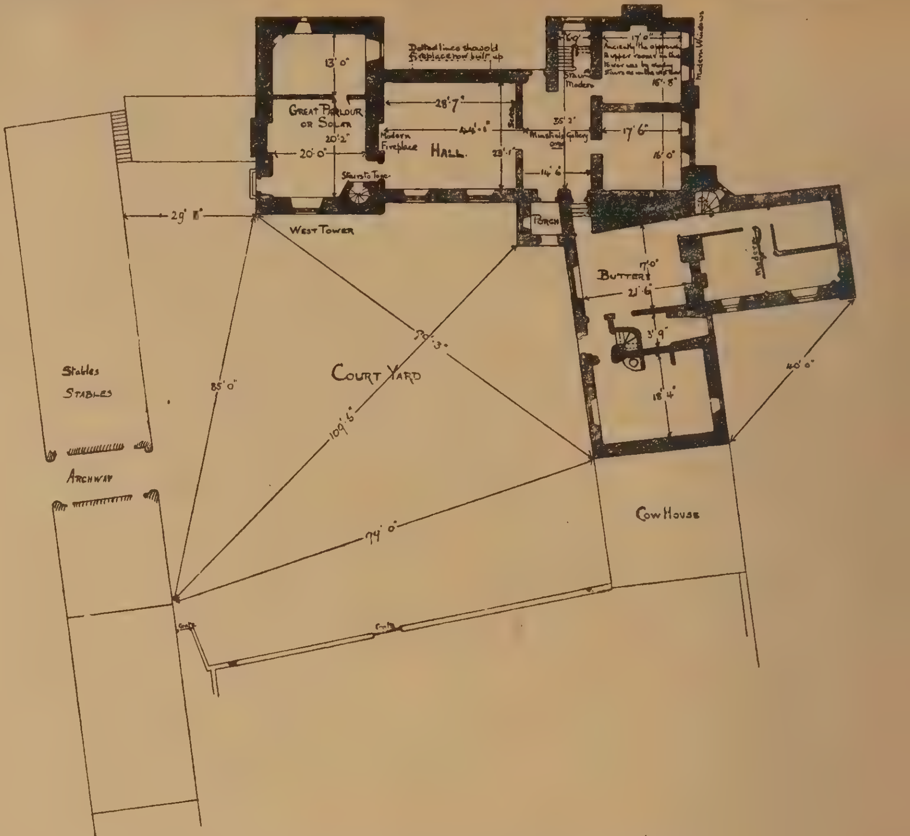
:Screen in Wensley Church: :Wensleydale: Yorks:

the transept and 63ft. across nave and aisles. On the south is the chapter-house, 48ft. by 35ft., originally supported by six marble pillars, of which four are perfect. The caps have a Byzantine appearance, and the bare moulds are as sharp as though cut yesterday.

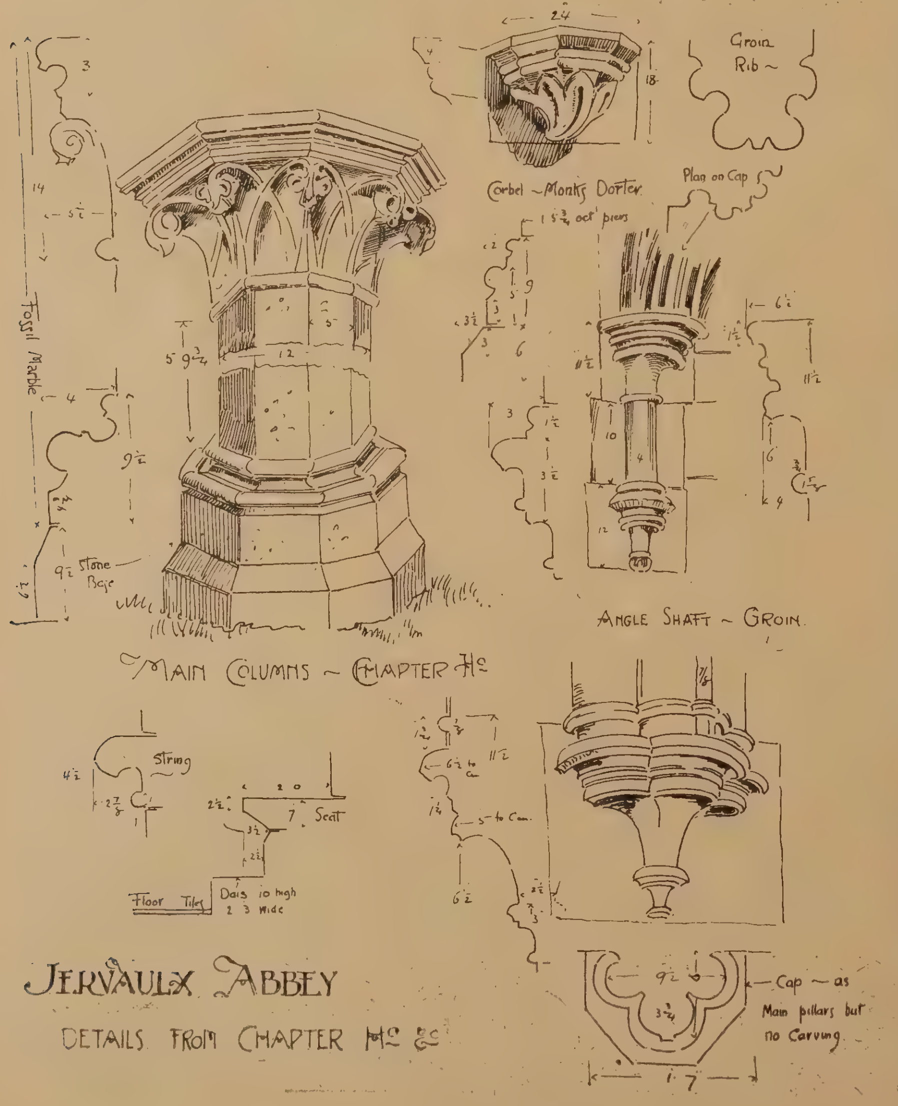
The stone seats and daïs running round three sides are perfect, and there are still remains of tiling. Of the Undercroft with Monks Dortes over, only the outer walls and pillar bases remain. East of the chapter-house is the abbot's lodgings, and further east the great kitchen, with three huge fireplaces, reminiscent of the hospitality for which the abbey was famous. To the west is the refectory, a noble room; at its south end we find a small chapel with a nearly perfect altar. Needless to say that there is plenty of opportunity for the study of mouldings, there being piles of stones of various portions of the doorways, windows, groins, &c., which are all the more "getable," if one may coin a word, from being in the position they are now.

It may be of interest to point out that it was a "Prior Aylmer of Jervaulx" who figured so prominently with "Isaac the Jew, of York" in Sir Walter Scott's "Ivanhoe."

The ruins were overhauled and excavated in 1806 by the then Earl of Ailesbury, but previous to that time had been used as a common quarry by the neighbouring farmers for generations. The present owner is Lord Masham, who keeps the place in good order. The key is obtained at a cottage near.



GROUND PLAN OF NAPPA HALL, WENSLEYDALE, YORKSHIRE.



Returning by Cover Bridge, and passing the inn, you cross the Yore by Ulshaw Bridge, the two rivers meeting near here. This bridge is one of the old picturesque kind, narrow, and with triangular recesses for the safety of foot passengers. Standing in the centre recess is a sundial bearing the date 1674. The road, rising rapidly, presently brings you in view of the castle of Middleham, which looks very massive and dignified from this point across the river. The charmingly situated village of Spennithorne, with its church tower peeping out from a bower of trees and blossom, is soon reached. The church, which is dedicated to St. Michael, dates from 1166, and was built by Robert Fitz Randolph. Three bays of the nave on the north are Norman, the south being Decorated work. About 1200 the church was lengthened one bay westward, the tower built and the chancel lengthened to its present length, and also the south aisle, porch and vestry added; the last, being part of the north aisle and extending into the chancel, was probably the chantry of the Fitz Randolphs. The tower is perhaps the most remarkable part of the church, its character being chiefly owing to the staircase turret which runs up the south-east angle in a rectangular projection, but in this instance is heightened by the appearance of figures surmounting the battlements on the south side, which looks towards Middleham and almost gives the appearance of being occupied by armed men.

Under the embattled parapet is a projecting moulded course with carved heads and bosses at intervals, also gargoyles: the aisles are enriched in a similar manner. The inner porch doorway is a fine Decorated example with foliated caps, and the east window of four lights is Perpendicular, the windows in the south side being Decorated. A curious form of sedilia is to be seen on the south side of the chancel of the form of a moulded stone bench, with shaped moulded elbows of stone 4¾in. thick, the space between the elbows being 3ft. 6in.

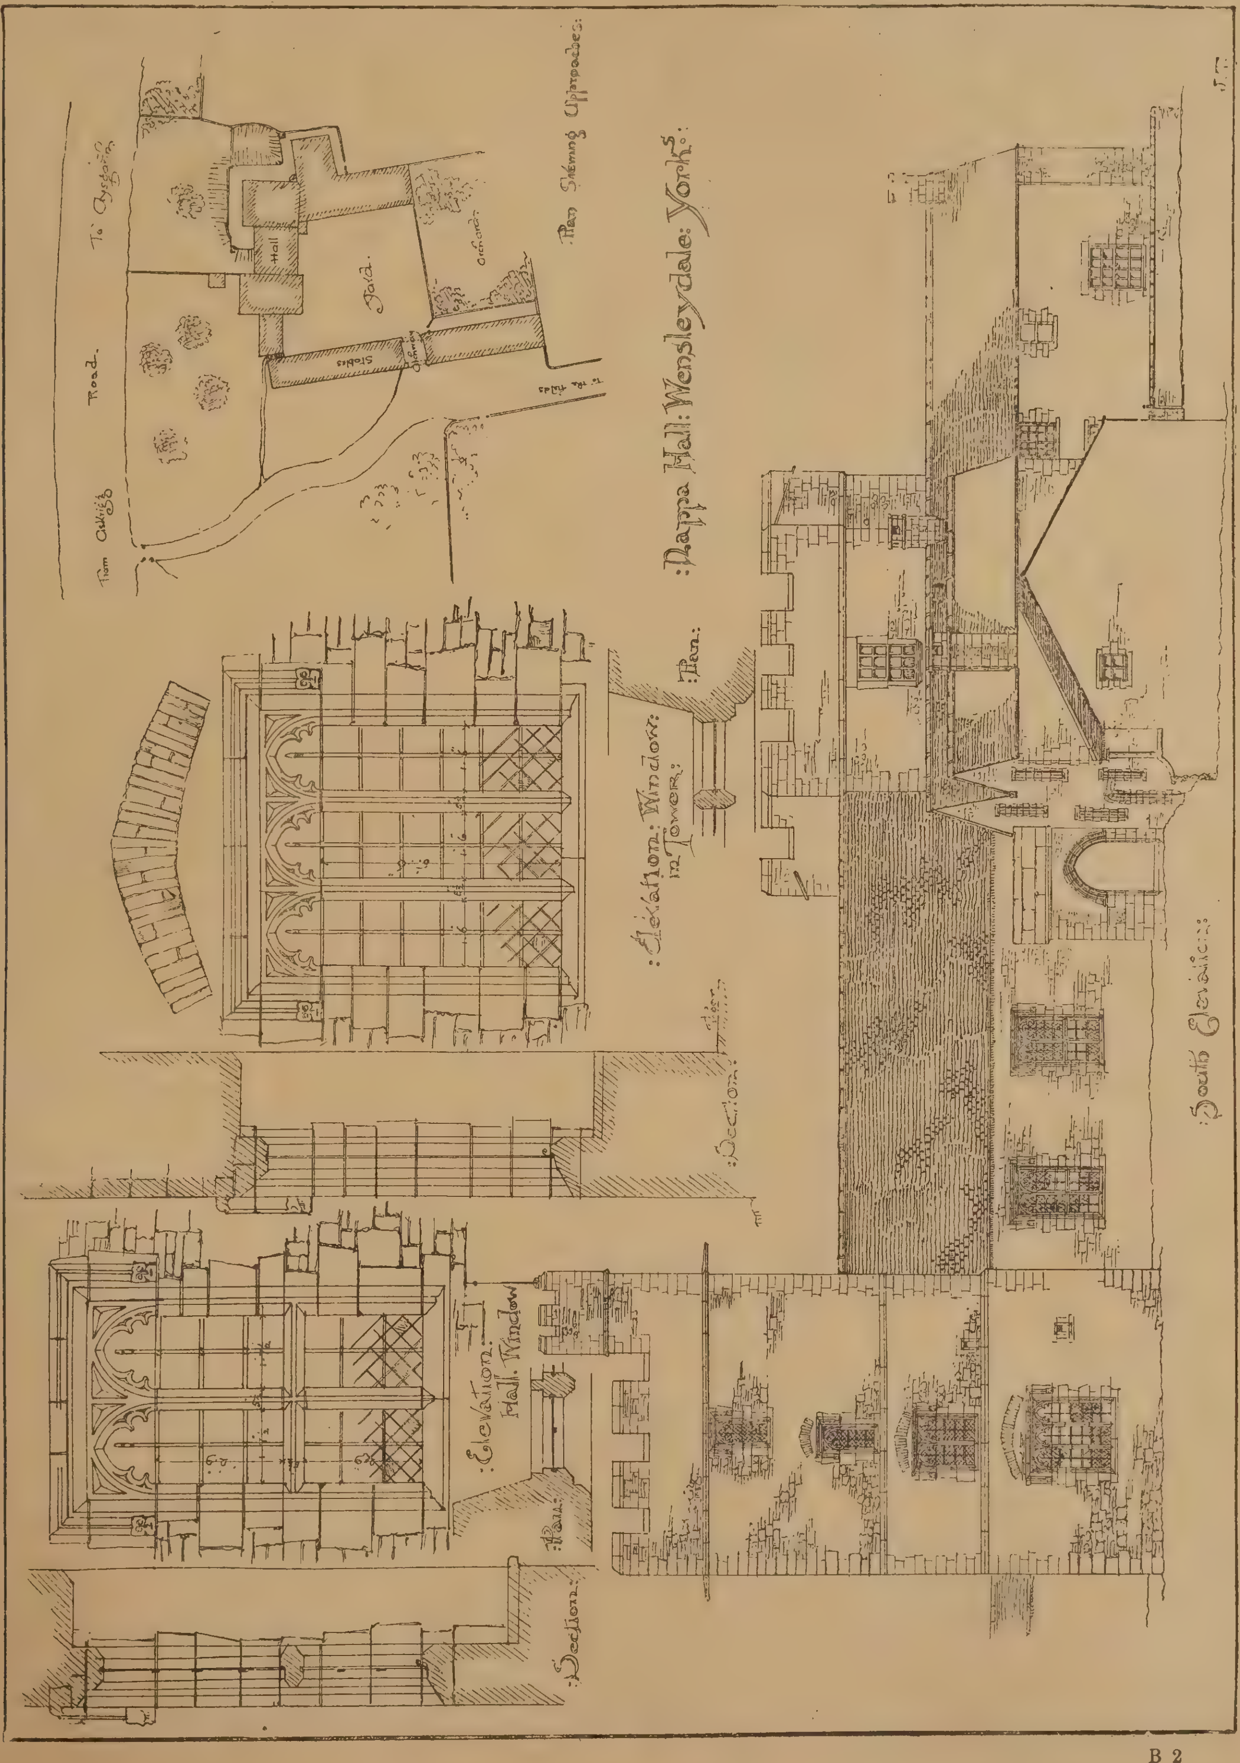
On the west wall of the south aisle is a figure of Time in fresco; this has been preserved by the many coats of whitewash on the wall. The altar tomb with shields and battlements in the north aisle is probably to some member of the Fitz Randolph family.

The parish church in the neighbouring town of Bedale is very fine, with a good tower and a crypt under the chancel. Your tour may easily be extended and terminated if desired at Ripon and York.

[The writer is indebted to J. Douglas, Esq., of Chester, for kind permission to use the plates of Nappa Hall, old stone door-heads at Wensleydale, and screen in Wensley Church—from the Abbey Square Sketch-Book.]

THE ARCHITECTURAL DRAWINGS AT GLASGOW.

A FIRST glance at the architectural section of the Glasgow Exhibition, through the medium of the catalogue, indicates at once the variety and the richness of the collection brought together in the Fine Art Galleries. Especially is this suggested by the collocation of names in the list of exhibitors. Robert Adam and Rowand Anderson, co-workers in the same building, Edinburgh University, though with a century between them, are here found side by side. Berlage Billings and Burnet, Campbell and Cuypers, Palladio and Paterson, Vandremer and Voysey, Webb and Wren—such are a few of the alphabetical groupings which strike the eye, and conjure up visions of the "mother art" in many lands and under many guises, of similar yet vastly different problems in plan, construction and design mastered by many minds. "An inspection of the gallery," says the "Glasgow Herald," "confirms these anticipations, and at the same time shows that the standard of the work exhibited is a high one; that of the 500 frames, of which many contain several drawings or photographs, few indeed are unworthy of careful study. There is matter for regret at the same time that the space at the disposal of this section of the Fine Arts Committee was so entirely inadequate for the amount of work placed at their disposal, with the result that

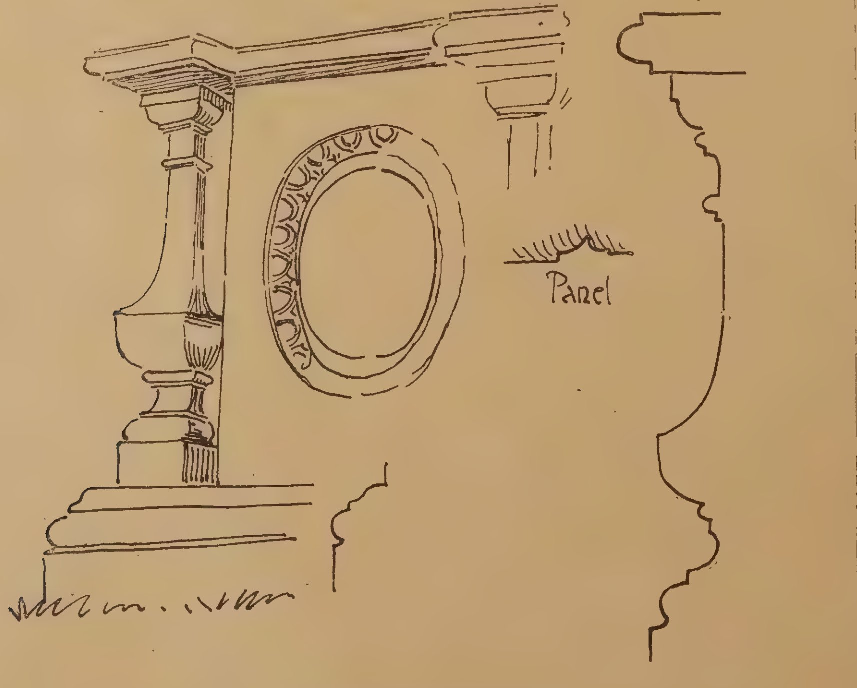


many interesting exhibits had been hung too high to be properly seen, while the grouping of works by the same artists and of similar character, which was originally intended, has had to be largely departed from.

"Not only so, but the collection has had to be dispersed throughout various sections of the buildings, the drawings from foreign sources being hung in the so-called North Balcony, while the interesting collection of photographs illustrating the architecture of Glasgow, brought together by the local Institute of Architects, has been hung at wide intervals under the arches leading into and round the walls of the Archæological West Court. In the east, or Architectural Court proper, the space on either side is divided up into a series of bays by screens extending from the wall to the stone piers supporting the galleries over; the back of each of these bays it was originally intended to devote to the work of one architect or group, but, as already indicated, the proposed arrangement had to be largely departed from owing to lack of space elsewhere to accommodate the works which could not be so grouped. In three or four cases it has been possible to adhere almost entirely, and in others partially, to this method of arrangement, with the result that a certain character is given to the exhibition, and the examination of the works either for study or review is rendered at once easier and more interesting, a result which might have been further assisted had the bays themselves been numbered. The one which first calls for notice, though not the first in the catalogue order, is that occupied mainly by a collection of work forwarded by the Royal Institute of British Architects, a collection in which the arts of architecture, sculpture and painting are all represented. The architects represented are all "old masters"; Palladio, the sponsor, and Inigo Jones, the father of Renaissance architecture in England, together with equally famous disciples and followers, Sir Christopher Wren, John Webb, and others, are represented by most interesting autograph sketch designs for chimneypieces, ceilings and other decorative feature. Sculpture of a personal kind adds a note of interest in the busts of Inigo Jones, G. E. Street and Sir Charles Barry, while of no less interest, personal and artistic, are the painted portraits of three more past presidents of the Institute—Professor Cockerell, by Boxall; Sir George Gilbert Scott, by Richmond; and F. C. Penrose, by Sargent; the last a brilliant example of the work of this artist, who, curiously enough, is not represented elsewhere in the galleries. Other works in the same group, and also forwarded by the Royal Institute, are a series of interesting drawings in colour or wash of notable buildings—the Middle Temple Hall, St. Paul's Cathedral, St. George's Hall, Liverpool, and others; while, though not sponsored by the Institute, the Hanging Committee has appropriately added in the adjoining spaces the design by the present president, Mr. William Emerson, for South Kensington Museum, balanced by that for the circular court of the new Government offices by the very recently deceased and greatly regretted J. M. Brydon, who was a vice-president at the time of his death."

THE NEW DOCK AT DOVER.

THE work on the new commercial dock at Dover is to be pushed forward as rapidly as possible. Until the Prince of Wales's pier, which has been completed at a cost of about £600,000, is connected with the South-Eastern and Chatham Railway systems, the Transatlantic traffic cannot be adequately dealt with. It is proposed to provide the necessary railway facilities in connection with the improvement of the old outer harbour, which is to be deepened. Lockgates are to be constructed at the entrance to this harbour, and the Prince of Wales's pier is to be connected with the railways by means of lines over these gates. The main portion of the scheme yet to be carried out is the erection of a water-station in the commercial harbour. This station, which will be 2½ times larger than Charing Cross Station, will accommodate sixteen trains under cover and have berths for four cross-Channel boats. The total cost of the works, including the sum required to pay off the debentures on the Prince of Wales's pier, will be £1,750,000. A largely-increased cross-Channel traffic, in addition to the development of a Transatlantic service, is anticipated. It is estimated that the harbour will be prepared for the Transatlantic traffic in two years, but it will take four years to complete the water-station.



A TOMB IN MIDDLEHAM CHURCHYARD.

THE WIDENING OF LONDON BRIDGE.

ARRANGEMENTS are now being definitely made by the Corporation for widening London Bridge, and this month a committee meeting will be held to discuss the sending out of circulars for tenders. The necessary plans and working drawings are being prepared in the office of Mr. Andrew Murray, the City Surveyor, and the work will probably be commenced next year. The problem of widening the bridge is one of immense difficulty, and has puzzled the City authorities for nearly a generation. The bridge throws a weight of five tons on every sq. ft. of its foundations in the London clay beneath the bed of the Thames, and when it was completed nearly seventy-five years ago the withdrawal of the surrounding piles and the squeezing out of the clay caused a somewhat unequal settlement of the foundations. This did not affect the stability of the structure, and there has been no perceptible movement since the first few months. But it is impossible to forecast the effect of driving piles or sinking steel cylinders near the foundations for the purpose of extending them, and engineers agree that the enterprise would be too risky. The complete rebuilding of the bridge would cost millions and untold inconvenience.

In 1879 a scheme was propounded for widening the bridge by projecting iron footways, really a sort of mantel-shelf, extending along each side, and supported upon the present arches. The ugliness of this was strongly resented by architects and others, and the scheme was defeated in Parliament. Two years ago the increased revenue due to the falling in of the leases in Finsbury Circus and London Wall, on property held in trust for the Thames bridges, led the Corporation to again consider if anything could be done with advantage to London Bridge. Enquiry showed that, while the Tower Bridge had relieved the vehicular traffic of London Bridge, the foot passengers were more numerous than ever, and that it is the footways which chiefly need extension. The idea of widening the carriage-way so as to allow six instead of four lines of vehicles was abandoned, and the City Surveyor and the resident engineer of the Tower Bridge, Mr. Cruttwell, suggested a scheme which, like that of 1879, extended the footways over the water on the "mantel-shelf" principle.

The new scheme (a plan and section were published on page 341 of our issue for November 28th, 1900) provided for stonework in harmony with the structure of the bridge, and passed through Parliament without opposition. It widens the bridge from 53ft. to 65ft., thus giving about 6ft. additional width to the footways on each side. The projecting part of the footway will end in a cornice supported by granite corbels, and surmounted not by a solid stone wall like the present one, which would be too heavy to place on the outer edge of the shelf, but by an open stone balustrade. Steelwork will be used to aid in supporting the footway and to assist the bolting of the corbels to the main structure, but this will be buried under the pavement and will be invisible. Owing to the substitution of a balustrade for the present heavy stone wall, the new work will only add 67lb. per sq. ft. to the weight thrown on the foundations of the bridge. As the clay bed of the river will not be disturbed, Sir Benjamin Baker, the eminent engineer, considers that the increased weight is too trivial to need the slightest consideration.

THE SMOKE NUISANCE

AND THE DECAY OF LONDON BUILDINGS.

THE London County Council have recently issued the annual report of Mr. Alfred Spencer, the chief officer of the Public Control Department. One portion of this report deals with the smoke nuisance.

The Public Health (London) Act, 1891 (sections 23 and 24A), makes it an offence to use a furnace in premises used for trade purposes so constructed as not to consume its own smoke, or to use a furnace so negligently that the smoke arising therefrom is not wholly consumed. Section 24B declares a chimney (not being the chimney of a private dwelling-house) sending forth black smoke in such quantity as to be a nuisance, to be a nuisance within the meaning of the Act.

Sections 23 and 24A, however, are so crippled by qualifying words that it is very difficult to obtain convictions under them. The only provision that is really valuable is section 24B, which deals with black smoke, and probably this is the only part of the smoke sections of the Act (except the sub-section dealing with river steamers) which is enforced in London. Smoke of other colour than black may, and does, when it is discharged in considerable volume cause very serious nuisance. In addition to this limitation on the powers of a sanitary authority for dealing with smoke nuisance the statutory procedure involves much unnecessary delay. Two successive formal notices have to be served before any liability to penalties is incurred, so that for a time nuisance can be continued with impunity.

The Council has no direct control over smoke nuisance, the duty of enforcing the provisions in the county of London resting with the various Metropolitan borough councils, who are the sanitary authorities under the Acts. Under section 100, however, the Council has a general power of acting where a sanitary authority is in default, and the Council's inspectors of explosives and coal officers have therefore been instructed to report any nuisance from black smoke of serious duration which comes to their notice in the course of their other duties.

More than a Thousand Cases in One Year.

This instruction has been in force since June, 1892, and under it evidence of 5,436 cases of smoke nuisance has been furnished by the Council to the various sanitary authorities in London. Of these, 1,018 cases were reported during the twelve months from April 1st, 1900. This is an increase as compared with the previous year, and is alleged by manufacturers to be due to the difficulty in obtaining supplies of smokeless coal. The Council has not had to act in default, although it was necessary to warn one sanitary authority that unless action was taken against a certain offender the Council would have to proceed in default. The local authority, however, took the necessary steps, and the nuisance was abated.

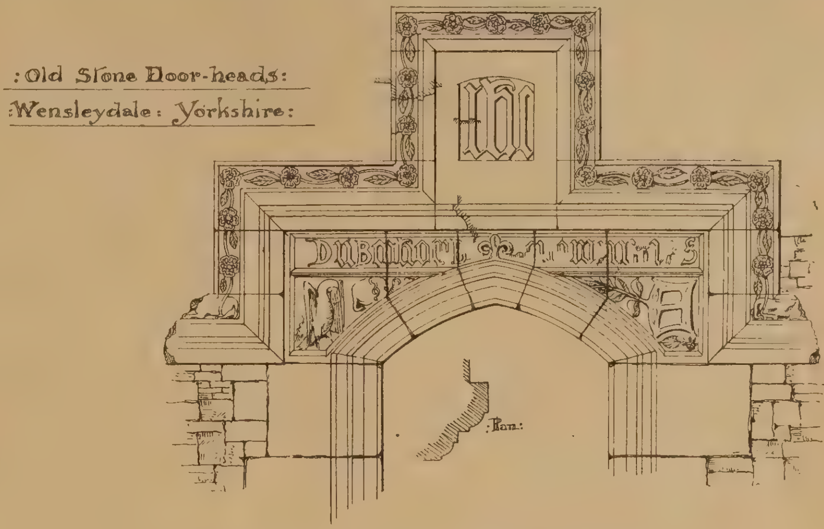
Altogether, the Council has put into force its powers under section 100 of the Act in respcct of smoke nuisance in fourteen cases, but in only two of these cases has legal proceedings followed against the occupiers or owners of the offending premises. In the remaining cases either the sanitary authority has itself at the last moment initiated proceedings or the nuisance has been abated on the service of the Council's statutory notice. What appears to be wanted is a power to the Council to act independently of the sanitary authority in cases of smoke nuisance. In this connection it is desirable to draw attention to section 12 of the Public Health (London) Act, 1891, which is as follows :—

"Complaint of the existence of a nuisance, liable to be dealt with summarily under this Act, on any premises within the district of a sanitary authority, may be made by any person, and thereupon the like proceedings shall be had with the like incidents and consequences as to making of orders, fines for disobedience of orders, appeal and otherwise, as in the case of a like complaint by the sanitary authority."

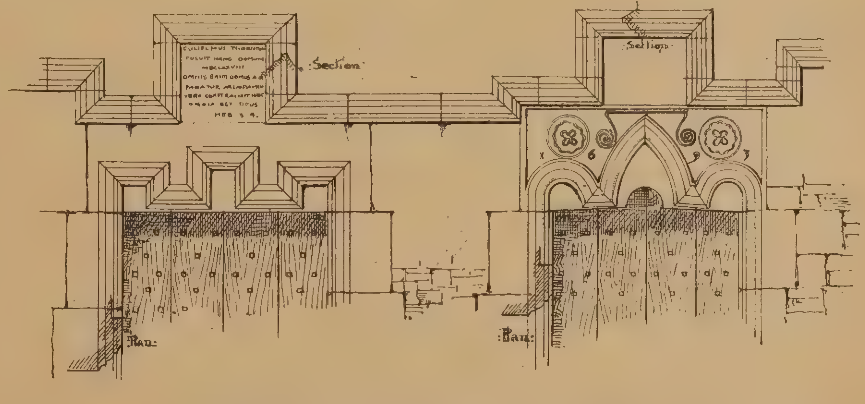
This section is a consolidation and extension of powers contained in the Nuisance Removal Amendment Act, 1860 (section 13) and the Sanitary Law Amendment Act, 1874 (section 59). Prior to the passing of the Public Health (London) Act, the power of acting independently of a sanitary authority under the last-mentioned sections was confined to "aggrieved persons." Now this restriction has been removed, and "any person" can put into operation the powers given by the section.

Mr. Spencer has endeavoured to collect particulars as to the statutory proceedings taken by the various sanitary authorities in the county of London in respect of smoke nuisance between April 1st, 1900, and March 31st, 1901. From five boroughs he has not been able to obtain particulars, but in the remainder he finds that in all 241 statutory notices were served, which were followed in 123 cases by legal proceedings, resulting in convictions in 102 cases, with penalties amounting to £454 16s.

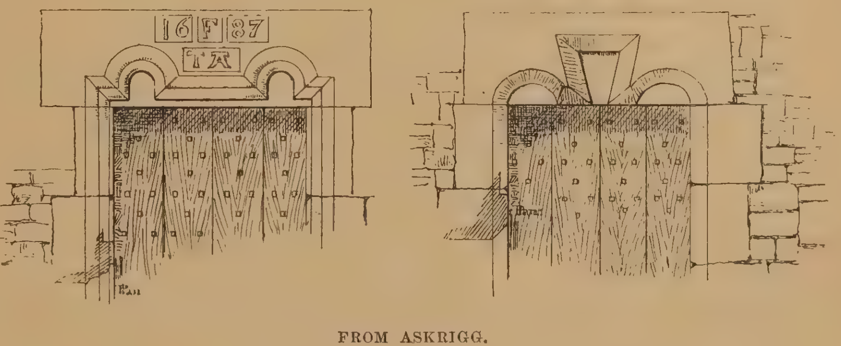
Having regard to the amount of smoke nuisance reported in the same period by the Council's officers, this return does not appear to adequately represent the number of convictions that might have been obtained. On the other hand, it is possible that, as already pointed out, a great deal of smoke was emitted while the cumbrous machinery provided by the law was being got under way. Mr. Spencer finds that in this respect London is in a far worse position than some of the provincial cities and towns, as *e.g.* Glasgow, where nuisance from smoke is an offence immediately punishable in a court of summary jurisdiction.



FROM COVERHAM ABBEY: ABBOT'S LODGINGS.



FROM THE ANCIENT HOUSE OF THE THORNTONS.



FROM ASKRIGG.

The Effect of Smoke on Westminster Abbey and Lambeth Palace.

Apart from the injury a smoky atmosphere causes to health and comfort, the damage to stone buildings in London is considerable. Few building stones will stand the London smoke for any great length of time, and the ordinary limestones which are mostly used for building purposes are found to decay very rapidly.

Complaint has been made from time to time of the decay of Lambeth Palace and Westminster Abbey, the decay being largely attributed to the fumes of hydrochloric acid emitted in the salt-glazing process at the Lambeth potteries. Acting on the instructions of the Committee, Mr. Spencer investigated the subject, and found that considerable care is taken to minimise the emission of the acid fumes and smoke from the potteries, and that experiments are continually being made to effect further improvements in this direction. The Chief Officer also found that the number of salt-glazing kilns, which alone emit acid fumes, has been considerably reduced in recent years, and that a still greater reduction had been made in the quantity of salt and coal used in the kilns. The proprietors of the potteries contend that the emissions of acid fumes are now so slight as to be quite powerless to cause injury either to stone or plants, and they point to the flourishing condition of the trees and shrubs on the Albert Embankment and in Lambeth Palace Gardens as affording conclusive proof of the correctness of their statements.

There is no doubt that in some portions of Lambeth Palace and Westminster Abbey the decay is very serious. In order to ascertain whether this could be attributed to hydrochloric acid fumes, analyses were made of portions of the decayed stone. The result showed that only a very small percentage of hydrochloric acid or its compounds was present; certainly not more than the normal percentage found in similar stone in other buildings in towns. In addition to this, an examination was made of about a hundred old stone buildings in various parts of London. It was found that nearly all these buildings also showed signs of decay as serious as that at Lambeth or Westminster. From this it would appear that the decay of the stonework of Westminster Abbey and Lambeth Palace is not more serious and rapid than that of other stone buildings in London. Moreover, before the Lambeth potteries were established, attention had been directed to the bad condition of the stone on the outside of Westminster Abbey, and Sir Christopher Wren stated that "the stone is decayed 4in. deep, and falls off perpetually in great scales."

Having regard to these facts it is reasonable to infer that the decay of these buildings cannot be specially attributed to fumes from the potteries, but is due partly to the great age of the buildings, the natural decay of which has no doubt been accelerated by the generally smoky atmosphere of London, and partly to the fact that much of the stone used is not well suited to resist such an atmosphere.

The Hackney Polytechnic Competition has been decided in favour of Mr. A. W. Cooksey, A.R.I.B.A. The assessor was Mr. Thomas Blashill, and Messrs. A. W. S. Cross and E. W. Mountford, were the only other competitors. The cost will be £50,000.

The Industrial Art of Paris continues to make great progress, and the municipal authorities encourage Parisian craftsmen in a generous way. The latest boon granted to the workmen artists is a salle in the Musée Galliera to be devoted to the art works of the ouvriers of the Faubourg Saint Antoine.

A New Market Cross and Drinking Fountain at Hexham has been erected in the Market Place. There is a large moulded trough, the stone for which was obtained from Heworth, county Durham. Connected with this trough is a smaller one for dogs. Rising from the centre of the trough is the fountain proper. On the four sides of it are copper plates of repoussé work. On the north side is a grotesque bracket, from which will flow a constant supply of pure water. At each of the four angles is an ornamental lamp (resting on wrought-iron foliage work), with copper tops and glass globes, under an ogee moulded canopy. The body of the fountain is of Cumberland red stone (which has been obtained from the well-known Harraby Quarries, near Carlisle) and is replete with carved work. There are carved pilaster panels with Ionic capitals. Above the pilaster are three lions rampant guardant. Over and above the pediments which surmount the Ionic capitals are heraldic panels filled with the coats or arms of the sees of York, Durham, Newcastle and Carlisle. Above these is a small moulded dental dome, and surmounting the whole in a stone cross. The architect for the work is Mr. W. H. Knowles, F.S.A., Newcastle. The stone carving has been executed by Mr. G. W. Milburn, sculptor, Bootham Bar, York: and the foundation has been erected by Messrs. J. Herdman & Son, builders, of Hexham.

THE OFFICE OF WORKS.

A VIGOROUS CRITICISM.

THE EARL OF WEMYSS, who has had sixty years' experience of public life, says that in all that time he knows nothing to equal the present unjustifiable exercise of casual, temporary, executive authority by the Office of Works with regard to the new public offices in Whitehall. Thus the War Office is now being proceeded with—*vide* the scaffolding, &c., in process of erection on the intended site—regardless of the request that models of the proposed buildings should first be made and publicly exhibited in accordance with time-honoured precedents. The Professor of Architecture (Mr. Aitchison), the Royal Institute of British Architects, the council of the new city of Westminster, and, lastly, the House of Lords, each in their several ways have expressed their desire that by means of models—the only safe and sure way—the public may be placed in a position to judge the public buildings their public servant at the Office of Works is about to erect at their—the public's—expense. The resolution to this effect was independently carried against the Government by forty-one to twenty, and when the minority is analysed it is found that all, save three, are in some form or other members of the Ministry, and of these twenty-two at least would (if free) have voted with the majority. The Earl of Wemyss now asks all interested in good government to say whether or not this is the way in which the public should be treated by their paid servant, who thus absolutely ignores public opinion in a matter æsthetically so vital to the Metropolis. And what, asks the noble Earl again, is the architectural qualification of the present autocrat of the Office of Works who thus abuses his casual official position? Before his appointment was he ever heard of as an architectural authority whose opinion would weigh against professional authorities such as those referred to, and justify his ignoring in his procedure alike their advice and the wise practice of centuries and of all civilised nations in the use of architectural models? Earl Wemyss owns to never having heard of his being previous to his appointment an authority on such matters; and he hardly thinks that successful action as the Conservative Whip in the Commons necessarily fits a man for the First Commissionership of his Majesty's Office of Works. But as it is in the present so it has been in the past. Men are sent to the Office of Works, not on account of their special fitness for the work they have to do, but as a matter of political convenience or necessity in the card-shuffling necessitated by the construction—not of buildings—but of Ministries. Now, surely this is wrong—very wrong—and in some form or other we should have Parliamentary security against abuses of power such as that from which we are now suffering on the part of the Office of Works, and which will make our aftercomers curse a system that has thus led to the neglect of needful precautions in dealing with the greatest opportunity in recent times of architecturally embellishing London. One thing as regards the future we can do, says Earl Wemyss, and that is appoint a permanent Royal Commission to whom all designs for public buildings, public monuments, or plans for the mutilation of our parks shall be submitted, and if approved be exhibited in model for public criticism before they are finally adopted. Further, all railway or other works in the Metropolis requiring the sanction of Parliament should as regards their design be equally submitted to the same permanent Commission as a security against engineering monstrosities in the shape of railway bridges and stations such as now unfortunately disfigure our previously beautiful Metropolitan river.

When, therefore, Parliament reassembles Earl Wemyss purposes, D.V., to move an address to the Crown praying for the appointment of such a permanent Commission, and he confidently looks for support from those peers who have, alike by memorial to Lord Salisbury two years ago—signed by 140—and by the recent division in the Lords shown their independence and practical interest in matters so materially affecting the Metropolis as the character of our public buildings.

SANITARY INSPECTORS IN CONFERENCE.

THE Autumn Conference of the Sanitary Inspectors' Association opened on Thursday last at Carpenters' Hall, Throgmorton Avenue. The chair was taken by the president, Sir Hugh Gilzean Reid, who in his opening speech said that the object of the Association was to raise the standard of the profession, protect its interests and extend its powers and privileges. He referred to the Bill introduced in Parliament to secure fixity of tenure for sanitary inspectors and medical officers of health, and congratulated the Association on having for the first time elected a lady member.

Sir Alexander Binnie, late engineer to the London County Council, read a paper describing the main drainage system of the Metropolis, with its network of sewers and intercepting sewers leading to the outfalls below London at Abbey Mills and Crossness. The difficulty of the work was increased by the fact that 12 sq. miles of Central and South London is below Thames high-water mark. The sewage is first treated with chemicals and its heavy matter allowed to sink, the remainder flowing into the river and being so pure that it makes the Thames water clearer than before it enters. The condition of the river has marvellously improved since the system was begun. The heavy deposit or sludge is taken out by ships and cast into the sea twenty miles beyond the Nore. He also referred to the experiments which are being made with a view to eliminating dissolved impurities from the effluent water by bacterial filtration.

In reply to questions, Sir Alexander said that the 4,000 or 5,000 tons of sludge daily sent to sea was useless as a fertiliser, its manurial value having been washed out by the water in which it came down the sewers. The Council had spent thousands in trying to make manure of the sludge, only to find that the stuff had to be burned after all. If the Council had control of London's water-supply it would greatly help them to deal effectively with sewers.

A paper by Professor Clowes, chemical adviser to the Council, was read on the bacterial treatment of sewage, by which after its solid matter has settled the remaining water containing dissolved organic impurities is passed through tanks full of coke. On the surface of the coke bacteria collect and liquefy and render inodorous the organic matter in the water. At present the system, which would be very costly, is only in operation on a small scale as an experiment. The older the coke beds the more efficient their action.

A paper by Mr. Prim, late resident engineer of the Houses of Parliament, was read on the system of ventilating, heating, cooling, lighting and draining those buildings. It was mentioned that at the close of the debate on the Home Rule Bill of 1886 there were in the chamber of the House of Commons 905 persons, and that the ventilating arrangements supplied every person with 1,326 cubic ft. of air per hour, or 22ft. a minute.

A curious story was told by Sir Alexander Binnie during the discussion on sewage treatment. Such is the destructive action of bacteria on sewage, he said, that even a cesspool is a bacterial filter and will empty itself if left long alone. When the King (then Prince of Wales) had been ill of enteric fever a searching enquiry was made into the drainage of his residences. It was found that Marlborough House drained into the old vaults of the nunnery formerly standing on the site. Although this condition of things was very offensive, it was noticed that the vaults had not been filled up by long years of use, bacterial action having constantly diminished the contents.

In the evening a dinner was held at the Holborn Restaurant.

On Friday a trip was made to Crossness and the Blackwall Tunnel, and on Saturday the drainage of the Houses of Parliament was inspected and a visit paid to Southend.

A Cookery School.—The Liverpool Training School of Cookery and Technical College of Domestic Science has been rehousing itself. New premises have been built in Colquitt Street from designs by Messrs. Pain & Charles Blease, architects, of North John Street, Liverpool.

ST PAUL'S.

An Explanation about the Underlying Water.

In a letter to the "Times" with reference to St. Paul's Cathedral Mr. G. Johnstone Stoney says :—

The important information given in your columns by Mr. Somers Clarke, the architect to the Dean and Chapter of St Paul's (see page 536 of our issue for August 14th), indicates that the foundations of the cathedral were carried by Sir Christopher Wren through an upper layer 15ft. or 16ft. thick consisting of the débris of old London. In the lower part of this layer the foundations were spread out to enlarge their foothold on the next stratum underneath, which is a thin layer of "pot earth" varying from 4ft to 6ft. in thickness.

It would appear from the facts as described by Mr. Clarke that the subsidence which has been going on more or less since the cathedral was built is to be mainly attributed to the removal and rearrangement of material by water, and chiefly by the water travelling sideways through the lower part of the layer of sand and over the upper surface of the London clay.

The Action of Water Travelling over Sand.

Water making its way along a layer of sand or gravel resting on clay acts in three ways. Such water is always charged with carbonic acid (and in this case probably with other solvent agencies), whereby parts of the constituents of the grains of sand and pebbles that it meets with are dissolved. Even pure water is able slowly to dissolve silicates. These chemical actions are what make the water where it oozes from such a stratum more or less hard. The percolating water is also constantly engaged in rearranging, however slowly, the pebbles and grains of sand between which it makes its way, and it slightly washes away the surface of any clay over which it travels. It is evident, too, that the subsidence to which these events give rise is likely to be more in some places than in others, thus doing all the more mischief.

Prevention Better than Cure.

It is evident, then, that if we can prevent any water from having access to the layer of sand, the chief cause of the subsidence which has been going on will be removed. The layer of pot earth which lies over the sand, being thin, is probably not in all parts impervious to water, and surface water may reach the layer of sand through it. But the greater part of the supply probably comes from the slow horizontal travelling of water which always takes place in a nearly horizontal porous stratum which has clay or other impervious material under it. The direction in which this subterranean water travels in that part of London is probably known, and at all events can be ascertained. It probably is from the north and east towards the south and west. If so, it would probably not be impossible to intercept the inflowing water, and carry it round, instead of under, the cathedral by a deep-seated sewer to the north and east of the cathedral ; and also to guard the layer of sand under the cathedral from surface water percolating downwards. If all water can be kept from having access to the part of the porous stratum which is under and near the cathedral, we may reasonably expect that further change in this layer will be prevented. and that the subsidence of the cathedral, so far as it is caused by this, which is probably the chief cause of the subsidence, will be arrested. It is evident too that deep-seated excavations like those of the District Railway and Central London Railway may, so far as their influence on the flow of water is concerned, have either a useful or a prejudicial effect—useful if they tend to intercept water which would otherwise ooze into the sand under the cathedral, prejudicial if they lie on the other side of the cathedral and drain away water from the layer of sand, thus increasing the flow of water through it.

The present letter does not take account of another possible cause of subsidence, viz., the squeezing out laterally of the London clay when tunnels at some distance from the cathedral are made through it. The effect produced in this way is probably of trifling amount, and moreover sufficiently uniform to lead to a tolerably equable subsidence of the whole building. A subsidence of this kind does little harm.

Correspondence.

The Site for the Queen Victoria Memorial.

To the Editor of The Builders' Journal.

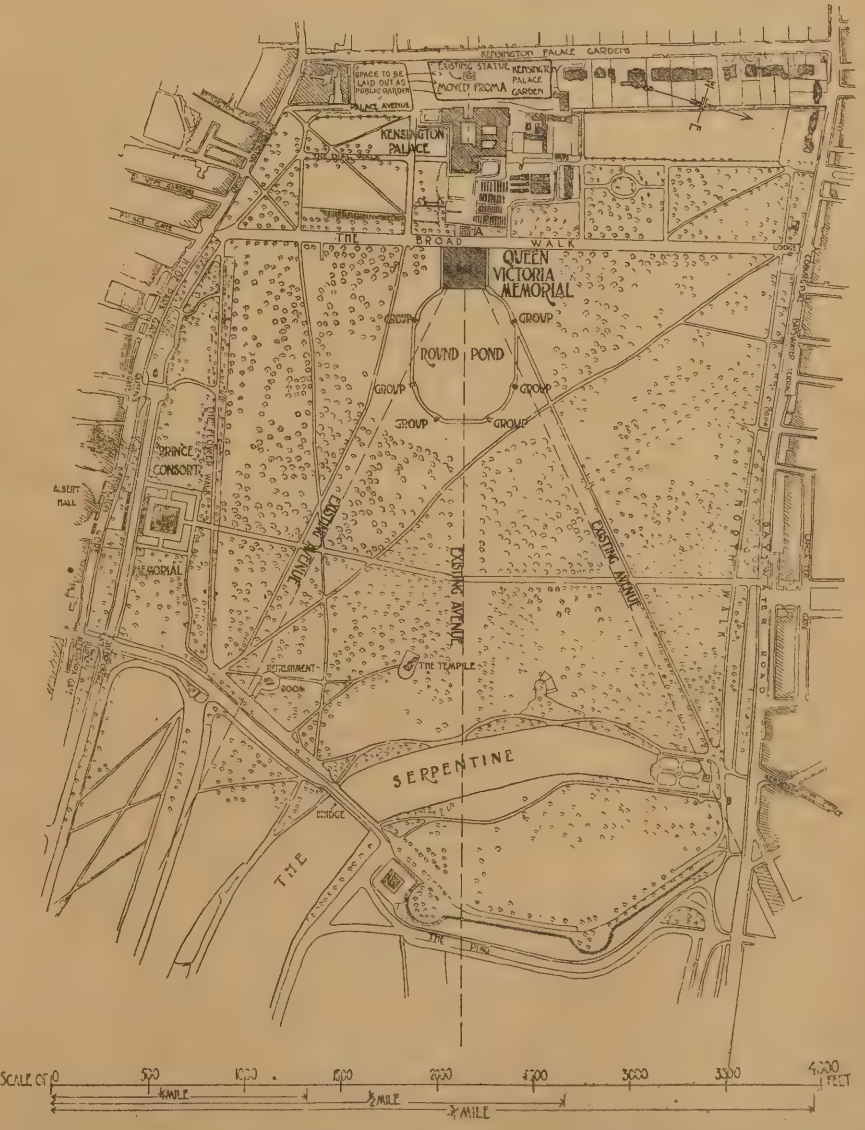
Sir,—I have been urged, even at the eleventh hour, to bring under your notice an alternative site for the Queen Victoria Memorial—on the elevated plateau in front of Kensington Palace—which about a month ago I ventured to suggest to an important member of the Memorial Committee. The accompanying plan, reduced from the Ordnance sheet, shows the site in question. With its converging avenues, fine sheet of water, open space, and endless ornamental possibility (without the sacrifice of a single tree or altering in any way the present character of Kensington Gardens), this site is of unequalled importance and beauty. Further, its special fitness for the Memorial to the late Queen rests on her having been born at Kensington Palace—where her toys are still preserved—while it was there she was told of her succession to the Throne. No such associations gather round Buckingham Palace. I am therefore not without hope that you may be induced to give the subscribers and the general public, as is just and right, an opportunity of judging as to the relative fitness of suggested sites for the National Memorial to our great Queen.—Yours truly. WEMYSS.

[It is to be regretted that Lord Wemyss did not make his suggestion earlier. We fear it is too late now for this site to be entertained.—Ed. B. J.]

THE ARCHITECTURAL ASSOCIATION.

THE SESSIONAL PROGRAMME.

We have just received the curricula of the Architectural Association for the Session 1901–2. Here for the first time appears the syllabus of the new day school of the association, of which we have already published particulars. The opening meeting of the session will be on Friday, October 11th, when the president, Mr. W. Howard Seth-Smith, will deliver his address and distribute the prizes awarded last session. The papers to be read are of the usual interesting character, and consist of the following : Mr. A. Wood, M.A., F.S.A., on "Cambridge in Early and Mediæval Times," Mr. Max Clarke on "The Sanitation of a Country House," Mr. Francis Bond, M.A., on "Capitals," Mr. J. E. Forbes on "Travelling Students' Notes," Mr. J. A. Gotch on "The Development of Domestic Architecture from the Twelfth to the Eighteenth Century," Mr. T. C. Cunnington on "Architectural and Constructional Engineering," Mr. C. Harrison Townsend on "Originality in Architectural Design," Miss Ethel Charles on "A Plea for Women practising Architecture," Mr. James Miller on "The Glasgow Exhibition," Mr. W. H. Lever on "The Dwellings erected at Port Sunlight and Thornton Hough," Mr. W. D. Caröe on "The Preservation of Ancient Buildings," Mr. E. A. Gruning on "Arbitrations," Mr. Owen Fleming on "Artizans' Dwellings from the Municipal Point of View," and Mr. Louis Ambler on "Artizans' Dwellings from the Private Point of View. " The following papers have been arranged for in the Discussion Section : Mr. H. Gregory Collins on "Stables and Stable Fittings," Mr. W. E. Davis on "The



New site for the Queen Victoria Memorial, suggested by the Earl of Wemyss.

Finishing of a Dwelling-house," Mr. Vivian H. King on "Designs in Furniture," Mr. Sydney Perks on "The Ethics of Dilapidations," Mr. H. Howard Humphreys on "The Manufacture, Testing, and Uses of Portland Cement," Mr. P. W. Mulready on "The Work and Influence of Augustus Welby Pugin," Mr. F. G. W. Buss on "The Clerk of Works, his Duties and Responsibilities," Mr. J. Dudley Forsyth on "Stained Glass," Mr. F. C. Eden on "The Organ: Its proper Position and Architectural Treatment," Mr. T. H. Russell, M.A., on "Dartmoor Granite," Mr. H. C. Lander on "Co-operative Homes," Mr. A. Needham Wilson on "A Tour in the South of France."

LONDON FLATS.

The Opinions of Two Medical Officers of Health.

THE subject of London flats and their relation to health, which is referred to in the letter by Dr. Bridges published on page 545 of our issue for August 14th last, is receiving increasing attention.

"Flats," says the "Daily News," "are a great subject. They are multiplying enormously. Rich and poor alike have taken to them. The working man calls his flat a dwelling. His well-to-do brother prefers the word 'mansion'; but, whatever be the name, the thing is imperatively demanded by the monstrous growth of the Metropolis."

Dr. R. Dudfield, the medical officer of health for Paddington, says that in many of the blocks of flats the buildings are so arranged that no proper accommodation is provided for the dustbin, while the accommodation available is often too close to the windows of the lower flats. Given these two sets of circumstances, the only remedy which will prove effective is a more frequent removal of dust. A daily removal is in force in many of the provincial and a few Metropolitan areas. Generally speaking, the rooms are too small and the system crowds people on to a small area. Flat life is particularly bad for children. They do not get enough air or light, and they miss the variety and exercise available by a garden or even a yard. There is another point to be considered. Blocks divided into flats are usually much higher than the ordinary house. That means a diminution of light and air for neighbouring buildings. Besides, even the better-class flats are sometimes built so that they have no through ventilation, and workmen's dwellings suffer still oftener in this respect. In both cases you find dwellings into which air and light can only enter at one side; so that there is very often a stagnant atmosphere and insufficient light in the rooms. It is true that in the high-class block you will probably find a central well, but even that is not a perfect arrangement, for though it may give the flats a certain amount of through ventilation it does not admit sunlight.

Dr. Sykes, the medical officer of health for St. Pancras, has studied the housing question earnestly for eleven years, and may be considered an authority on it, especially as St. Pancras is rich in flats of nearly all kinds. In March and April he gave at the Royal College of Physicians a series of lectures on "The effect of building on health in relation to the changing style of habitation." These discourses will shortly appear in book form.

The housing question, says Dr. Sykes, is quite different in London from what it is in other towns. Here it means flats; there it means cottages. If you want to build cottages here you have to do it on the outskirts, and he very much doubts whether the working people whose employment is in the centre of the town will travel so far. In Dr. Sykes' opinion the only way to get over the difficulty is to rebuild central London in flats, and that is what is happening.

Asked as to whether he thought that as regards health flats are all they should be, Dr. Sykes replied: "Certainly not. I say they are what they should not be, but they can be improved, and they ought to be, but the law will have to be altered. The London Building Act of 1894 was an attempt to improve matters, but in some respects it makes them worse. The landlords were too sharp for the County Council. Previous to 1894 rebuilding on an old site was accompanied by the restriction that a yard or other open space within the area must be left open, but since the passing of the Act it has been possible to build on such open spaces to a height of 16ft. This means less light and air. And the worst of it is that the landlord may reckon the height of his new building not from the pavement but from the top of the 16ft. structure. Even where he has not this special opportunity of diminishing light and air, the case is bad enough. The County Council fought to keep the height of buildings no greater than the width of the street. They only succeeded as far as artisan's dwellings are concerned. I am speaking of old streets. As for brand new ones, you have to go five miles out to find them. That is not all. The greatest injury to public health was done by the provision relating to spaces at the backs of houses and other buildings. The Act says that the height of a building may be twice as great as the width of the space at the rear, a provision most injurious to health.

"Even flats at £200 or £300 a year are not perfect from the point of view of health. They are often built round a central well, where the air is stagnant and no sunlight shines. The system is infinitely worse than the courtyard arrangement of France and Germany, because in those countries the central well or courtyard communicates with the street by means of a carriage-way. With regard to the want of through ventilation in flats, it is a difficult subject, but undoubtedly there is such a drawback and it ought not to be allowed. The fact is that many flats are practically back-to-back houses. It is a nice cheap arrangement for the landlord, but the result is that for each dwelling there is only light and ventilation from one side. I suggest that of every two rooms in each dwelling one should be on a front opposite to that where the other is situated.

"We want much more stringent regulations as regards flats; and, more important still, old houses let in tenements, a purpose for which they were not intended, should be converted into flats. While I condemn some of the things in connection with flats, I find the system infinitely better than that of tenement houses. There are examples of the two close together at Somers Town, and you can see at a glance that the flat-dwellers have much better health than the tenement-dwellers. Those that live in the tenements pay 6d. a week more for their rooms, and they are 1s. worse. The great solution of the housing question in London is to change the tenements into flats and insist on healthy conditions for the more modern system."

THE OXFORD MUSIC HALL.

THE Oxford Music Hall, London, has just undergone considerable alteration and redecoration. Under the superintendence of Messrs. Wylson & Long, the well known theatre architects, the interior has been entirely re-decorated. Changes have also been made in the colour of the upholstery, which has been carried out in Utrecht velvet of a deep rich crimson, instead of brown as formerly, while the old green tableaux curtains are replaced by others of crimson silk brocade, which, with corresponding draperies, form an effective stage *portière*. New carpets, of a similar colour, have been laid throughout the building, and the tones of the wall and ceiling decoration have been kept subdued, ivory and gold being the prevailing colours, relieved here and there by pale sea-green. A new feature in theatre-decoration is the liberal use of art metal from the workshops of Messss. Benham and Froud. The whole of the pillars are encased with hammered and repoussé copper, and the dados on the ground floor and in the balcony contain panels of rich gold metal. The existing saloons have been re-decorated, and a new crushroom is in course of construction in the balcony. In addition the stage has been considerably enlarged, and an extension has been made in Hanway Street in the shape of an additional exit for the audience, a stage entrance for performers and workers, and new dressing-rooms fitted with every convenience. Attention has been paid to lighting and ventilation; while a fireproof curtain has been fitted to shut off the stage from the auditorium.

Masters and Men.

A Strike in Camberwell has occurred of the whole of the workmen employed in the erection of the new Camberwell Infirmary, Havil Street, Camberwell, as a protest against the summary dismissal of two of their number.

The Penrhyn Strike.—Experts dispatched some months ago to inspect the recently discovered vein of slate at Smith's Sound, in Newfoundland, have reported so favourably that there is to be a large emigration of quarrymen forthwith from North Wales. The newly-opened quarry at Smith's Sound is already being worked by about thirty Welshmen, whose numbers will now be largely recruited from the dissatisfied quarrymen.

The Union of Carpenters and Joiners have opened a new branch in Burton. Mr. Elliott (president of the Derby branch) occupied the chair at the meeting for its formation, and with him were Mr. Matkin, J.P., Liverpool (general secretary), Mr. Gaskill, Mr. Potter, Mr. Shylock, Mr. Thomas, Mr. Seamer (secretary of the Derby branch) and Mr. F. A. Hill. Mr. Matkin, J.P., in a speech condemned the introduction of piecework. Mr. F. A. Hill was appointed secretary of the new branch.

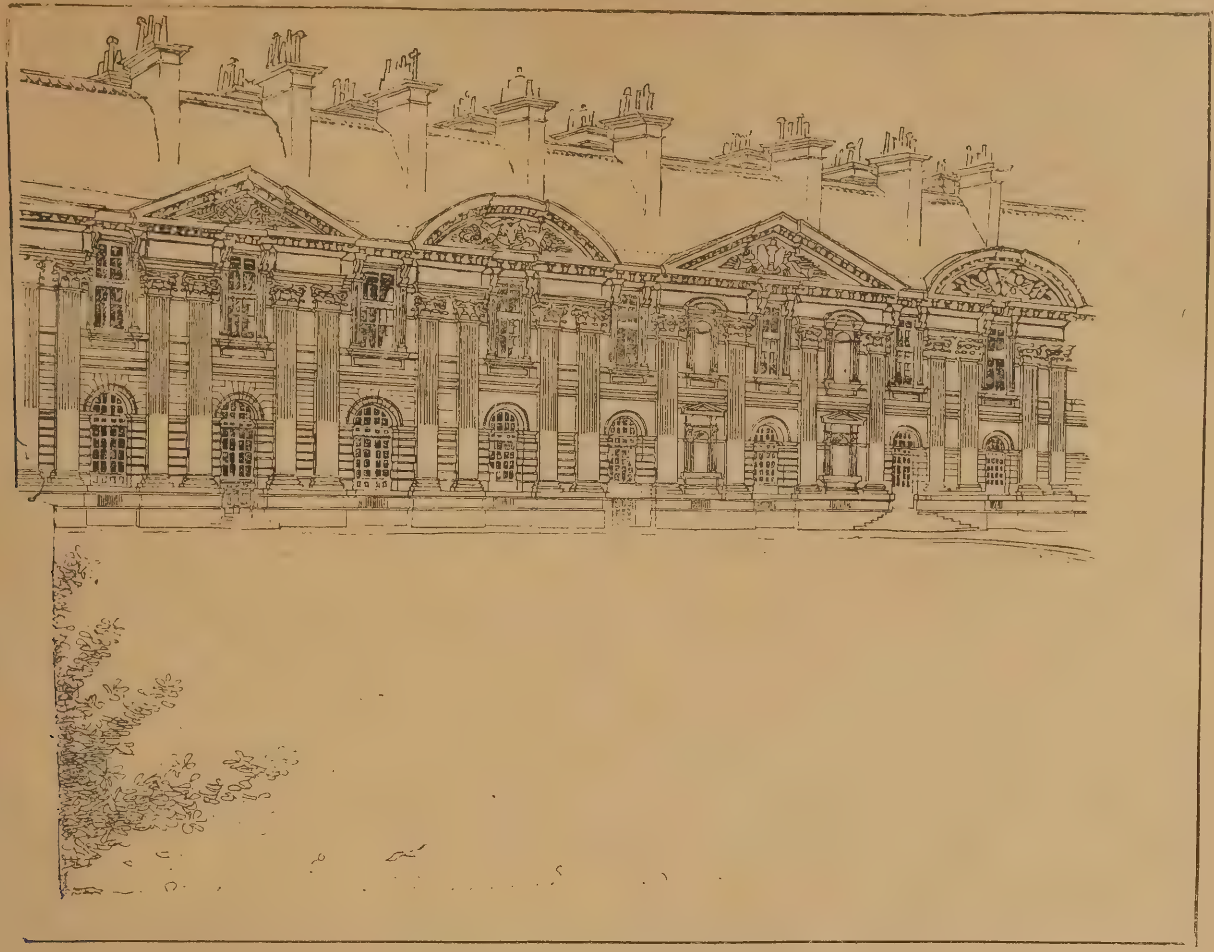
A Curious Sunderland Strike.—A number of painters employed in redecorating Christ Church, Sunderland, struck work last week because women were being employed to clean and scrub the seats. The contractor immediately called a meeting of the Master-Painters' Association, and they agreed to support him in resisting the strikers. As the work was urgent, they proceeded in a body fourteen strong to the church, where, in their shirt-sleeves, they took up the work abandoned by the men and completed the work in a few hours.

Newcastle Building Dispute Settled.—In the action of *Reid* v. *Sanderson*, which came before Mr. Justice Joyce in the Vacation Court, London, last week, by way of a motion to restrain the defendant from erecting a building in Newcastle, Mr. Bramwell Davies, K.C., said that the parties had now arranged matters. They had agreed that the action should be discontinued, the plaintiff having agreed not to take action against the defendant. The matter had been got over by the building being sold, and each party would pay their own costs.

The London Housing Problem and Workmen's Wages.—At the monthly meeting of the Metropolitan Radical Federation, held at Paddington, a discussion took place upon housing accommodation in London, when the following resolution was unanimously passed: "That, in view of the heavy cost of housing accommodation, and the continually increasing cost of living in London, the Federation is of opinion that no male adult labourer engaged and living within the Metropolitan area should be employed by the London County Council at a lower wages than 30s per. week."

NEW MASONIC HALL AT OKEHAMPTON.

THE new temple of Masonic Lodge Obedience, 1753, at the corner of Station Road, Okehampton, was dedicated last week. The new building is of stone, in the Renaissance style, with slated roof. Externally the structure is plastered, with rubber brick dressings, relieved by moulded wood; while the roof is surmounted by an ornamental turret, and there is an imposing elevation to Station Road. The accommodation comprises robing- and retiring-rooms, a lodge room 36ft. by 22ft. with a height of 18ft., a lavatory and the necessary offices. The entrance lobbies and corridors are furnished with tile floors, and all are provided with swing doors. The lodge room has an open roof, with a pitch-pine dado, and an ornamental mantel with eagle grate. The whole of the woodwork is tinted ivory. The premises are heated by means of open fireplaces, gas is laid on throughout and ventilation is provided in the roof. Muranese glass has been used throughout for the windows. The contractor was Mr. Sleeman, of Okehampton, who executed the work in accordance with the designs of Mr. J. A. Lucas, F.S.I., of Exeter.



THE LOUVRE, PARIS: FRONT TO THE PLACE DU CARROUSEL. PERCIER AND FONTAINE, ARCHITECTS. DRAWN BY H. F. COOKE.

BOY BUILDERS.

WHAT THEY ARE DOING AT FELIXSTOWE.

VISITORS to Felixstowe may be invited to take note of a building scheme now in progress there which is unique in its way and forms quite a remarkable instance of what can be accomplished by self-helpfulness and voluntary effort. At present the outward and visible sign of this enterprise is not very conspicuous. It consists of a half-finished edifice in red brick, with the scaffold-poles still around, standing on a plot of ground near the Bath Hotel stables. There is nothing to distinguish it from any ordinary work of the kind, but its interest lies in the fact that the boys of the place, helped in contributions of material by sympathetic friends, are here building for themselves what may be fairly called a "local habitation and a name."

In Old Felixstowe, somewhere near the old church, there is a village club and reading-room. Into this institute boys were once admitted, but they were eventually turned out by the adult members. This fact came to the knowledge of several ladies, and a meeting-place for the lads was found in a room kindly lent by one of these ladies. Within two or three weeks, however, the attendance was so large that further accommodation had to be looked for, and a move was made to the Felixstowe and Walton School, the members of the board granting the use of a room free of charge. Here, with some sixty names on the roll, the average number present each evening of the "session" was about thirty, and classes were instituted in numerous subjects—carpentering and building construction, chip carving, brushwork, clay-modelling, drawing, writing, arithmetic, Swedish drill, book-keeping, paper-designing, netting, physiology and singing. Amongst the students a few were careless or indifferent, but a great majority showed both aptitude and application. Some specimens have been seen of brushwork and of clay-modelling which prove that these boys, many of whom come straight "off the land," possess natural powers and capacities which it would be a shame and a waste to leave undeveloped.

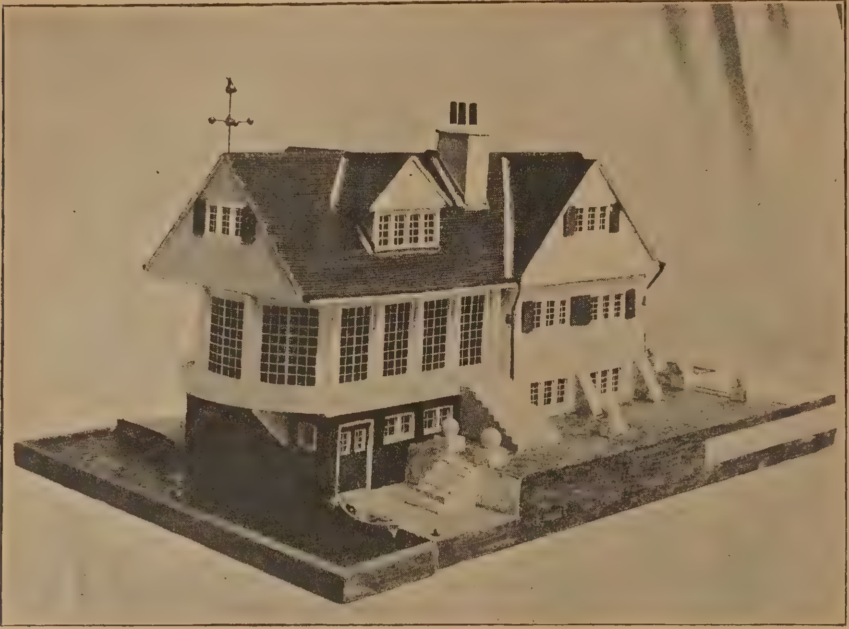
The feeling was generally entertained, however, that the accommodation provided at the Board schools was in some respects unsatisfactory; and the determination to have a club-house and home of their own took definite shape and form. This was largely due to the advice of Mr. Arthur Leggett, who, with Mr. Carter, conducted building construction classes; and at one meeting of the committee he brought out the somewhat startling proposition that the boys should undertake the construction of a suitable building under his supervision.

Mr. Felix Cobbold gave permission for the building to be erected on his land; Mr. G. W. Leighton prepared the necessary plans; Mr. C. A. Creasey, Mr. Woodmancey and Messrs. Bugg & Jolly provided bricks; Mr. F. W. Mason, the cement, lime, and timber; Captain Pretyman, M.P., shingle and tiles; Mr. Linzell, the "damp-course"; Mr. Fred Bennett, the scaffolding; Mr. Andrews, some appliances; Mr. H. P. Varley, Mr. Chalmers and Mr. Hyem did the carting; Mr. Harry Bennett undertook the roof work; and Mr. Napier Prentice has promised to instal the electric light. These were all the names mentioned, but the probability is that the list does not include every donor, and it should be said that by the express desire of the boys the proceeds of a very successful sale of their work during the winter was devoted to the same purpose.

The work of building was commenced early in the present season, and is for the present restricted to the erection of one room measuring 40ft. by 24ft. To this there will be added in future one or two classrooms and other adjuncts to a well-appointed club. At the present time the structure is ready for the roof-covering, and all the boys who have any notion of carpentering are working in Mr. H. Bennett's yard. As operations upon the spot are temporarily suspended, therefore, no sufficiently vivid conception can be formed of the voluntary labour that is now represented in solid bricks and mortar. Some boys have stuck to their self-imposed task for several evenings in each week and during the whole of Bank holidays; their friends, including one member of the district council at least, have from time to time dropped in to lend a helping hand; one of the ladies even has been seen on top of the scaffolding engaged in the rough task of laying bricks; and it is said that a visiting clergyman—now indisposed, unfortunately—evinced such an active interest in the work that he went through a brief apprenticeship to the business, starting right from the elementary task of learning how to mix mortar. Thanks to Mr. Leggett's oversight, too, the result of these amateur performances is highly satisfactory. The "courses" may not be quite so straight and perfect as those laid by skilled artizans; but the walls are strong and substantial, and the house will stand for many a year as a monument to the industry of the Felixstowe and Walton boys and the practical philanthropy of their friends and advisers.

It may be said in conclusion, as was hinted at to begin with, that there is probably no other place in the kingdom where the boys of the locality are building a club-house for themselves and where such a work is being carried through without payment of a single penny to those engaged in it. This notice was not written with any "begging" purpose, but further help and encouragement will be heartily welcomed; the hon. secretary is Miss Adams, who lives at "Langwarren," on the Bath Road, nearly opposite the site on which the new club-house is being erected. Visitors interested can inspect the building on Saturday afternoon, or after six o'clock on any evening except Wednesday. A notice board, on the right of the Bath stables, walking toward Felixstowe, indicates the site.

The Carpenters' Company are offering two free scholarships at King's College for building construction. The examination will be held on Thursday, September 26th, and candidates are required to send in their names before Friday, September 20th, to Mr. S. W. Preston, Carpenters' Hall, London Wall, E.C.

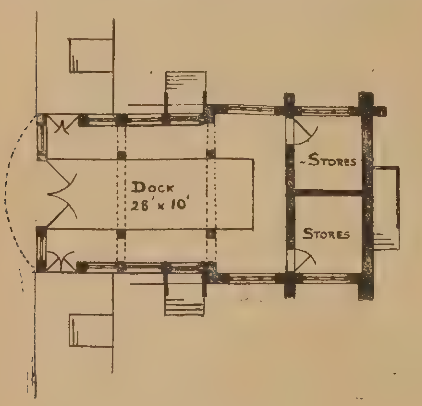


PROPOSED BOATHOUSE AT MAIDENHEAD FOR MRS. BROWN POTTER. LIONEL CRANE, ARCHITECT. (*Photo by Henry Irving.*)

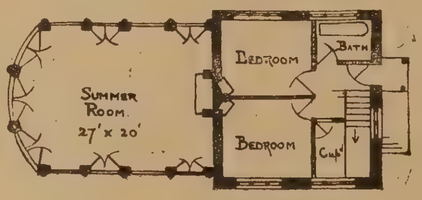
L'ART NOUVEAU AT SOUTH KENSINGTON.

"THE ARCHITECTURAL REVIEW" for September illustrates a number of the objects in the collection of "L'Art Nouveau" furniture, pottery, glass and so forth, which was recently given to the South Kensington Museum. Surprise is expressed that the authorities could have been brought to admit pretentious trash like this to the hospitality of a national museum. "The donor," says this magazine, "is Mr. George Donaldson, described as 'Vice-President of the Jury of Awards' in the Paris Exhibitions of 1889 and 1900. The notice in the gallery explains that Mr. Donaldson selected these objects in the recent Exhibition, and presented them to the Victoria and Albert Museum 'to show European developments in this direction to British furniture designers.' The British furniture designer has no need, one would think, to go so far abroad for examples of what to avoid in design. One can hardly suppose, however, that this was Mr. Donaldson's idea in buying and presenting the collection. But if he regards them as examples to be followed, what are we to think of the value of awards for design given by a committee of which this gentleman was vice-president? Not only are the things wretched in design and construction and indifferent in workmanship, but they are not even the typical and original examples of a bad fashion. They are the rinsings of the dish, the after-effects of the fantastic malady. The Belgian and French designers who started the fashion (on English inspiration) are not represented; we have merely the commercial hackneying up and down Europe of motives at a fifth, sixth . . . tenth remove from an unhappy original. The things, then, have no claim for their own sake to a place of honour; nor, even were South Kensington a pathological museum for design-disease, would they have any claim to attention as symptoms. Indeed, it would be a wholesome rule to be extremely stingy in admitting anything contemporary. Works of art ought to be filtered through the appreciation of a generation at least before they are taken into our museums. South Kensington, moreover, is not only a storehouse of art, it was intended to be a school for designers. Can anything be more deplorable than to set examples like these before our art students with an official stamp of approval? Art students are only too ready to catch up the most recent craze; this ill-bred 'new art' is offered to them from every corner in Europe by the art reviews; and the one or two weedy ideas that run through it sow fresh crops wherever the seed falls. Architecture itself is attacked by the disease, and in Germany and Austria queer goitred styles have sprung up in which some 'decorative' feature has swallowed constructive significance and beauty."

This indictment is a very heavy one when it is remembered that "THE ARCHITECTURAL REVIEW" is directed by an editorial committee composed of our most eminent and best-known architects, including Messrs. Norman Shaw, R.A., John Belcher, A.R.A., F. T. Baggallay, Reginald Blomfield, G. C. Horsley, Mervyn Macartney, E. J. May, Walter Millard, Ernest Newton, E. S. Prior, Halsey Ricardo, Leonard Stokes, Professor F. M. Simpson, and Mr. D. S. Maccoll, the well-known art critic.



PLAN AT WATER LEVEL.



GROUND-FLOOR PLAN.

Builders' Notes.

Smithfield Market to be Re-painted.—About fifty tons of paint will be used and some £12,000 spent in the painting of Smithfield Market, which is just going to be carried out by the Corporation. It is ten years since the market was last done, and it is estimated to take eight or nine months to finish the work. The predominant colours will be blue and yellow.

New Union Offices at Birkenhead.—The Board of Guardians have accepted the tender of Mr. W. H. Forde, builder, Birkenhead, to erect the new union offices in Conway Street, near the Haymarket, for £18,010. The total cost, including land, buildings, fittings, furniture and all expenses, including the architect's fees, will be approximately £24,000.

Taking Advantage of an Error in a Contract.—At a recent meeting of the Public Works Committee of the Merthyr Urban District Council a letter was read from Mr. J. Morgan, whose tender had been accepted for the erection of 100 workmen's dwellings at Penydarren, stating that he had made an error in the figures, which should have been £15,600. On the motion of Mr. D. W. Jones it was agreed that the contractor be compelled to carry out the work or that steps be taken to make him do so. The council, Mr. Jones said, had had a deal of trouble through contractors, after their contracts had been accepted, writing to get errors in figures amended.

Mr. Robert George Seaman, builder, of 2, Priory Place, Friars Street, Ipswich, met with his death last week by a fall from a scaffold. The deceased, whose business premises are in Crown Street, had a contract for the erection of two houses in Stirling Street. Besides personally supervising the work, Mr. Seaman himself took part in the building operations, and was so engaged when he met with the accident. Towards the end of the afternoon Mr. Seaman was putting up some troughing, and the staging upon which he was standing consisted of a plank, which rested upon a scaffold pole forming part of the scaffolding round the house, and a ladder. This seems to have suddenly fallen away, and Mr. Seaman, probably without warning, fell into the yard of an adjoining house, a distance of 16ft.

Mr. William Gibson, a well-known contractor, of St. Leonards, Exeter, died recently. He was born at Bankhead, in the parish of Monikie, county Forfar, on June 18th, 1853. He left Scotland at the age of sixteen and worked in Newcastle, afterwards going to London, where, at the age of nineteen, he was engaged on various large works. Six years later he went to Exeter and acted as foreman for Mr. Luscombe, in connection with the restoration of the Lady Chapel of Exeter Cathedral and other important undertakings, including the restoration of the castle front. Twenty-one years ago he commenced business for himself, his first contract being the new tower to Misbery Church, Essex. After this he took up contracts for the erection of villas in Tiverton Road and Union Road Exeter. He was also entrusted with large contracts in Devon, Cornwall, Somerset, Dorset, London, &c., while at the time of his death he had large works in hand at Weston-super-Mare.

Failures of London Builders.—In the London Bankruptcy Court last week the first statutory meeting under the failure of Messrs. W. Antill & Co., builders, of Mornington Crescent, Camden Town, was held. The partners were William Antill, A. W. Peterson, William Henry, and E. A. Young. The joint accounts showed gross liabilities amounting to £10,898, of which £10,211 were expected to rank, and assets estimated at £7,462, after providing for preferential claims. A resolution for bankruptcy was passed.—A first meeting of creditors was also held under the failure of John James Weibking, who carried on the business of a builder under the style of John Weibking & Sons, at 65, Southgate Road, also at Islington and Hoxton. The liabilities were estimated at £15,494, and the assets at £7,768. The debtor consented to an adjudication.—There was also a first meeting under the failure of Mr. R. V. Wellesley, a builder, of Shepherd's Bush. The liabilities were estimated at about £7,000, with assets of small amount.

Law Cases.

The Law Affecting Sun Blinds.—An important decision concerning the use of shop-blinds was given by Mr. Pitt-Lewis, K.C., at the City of London Court last week. Messrs. Diviani Brothers, restaurateurs, 157, Fenchurch Street, E.C., sued Mr. Gay, farmer, Eastbrook End, Essex, for £10 15s., damage caused to a sun-blind. In July last one of defendant's large vegetable waggons was returning from the Borough Market through Fenchurch Street, and as it passed the plaintiffs' shop it pulled the sun-blind down, damaging the facia and smashing the blind. The roadway was up at the time, and that confined the space reserved for vehicular traffic. The defendant's case was that the plaintiffs' blind, in coming down to within 14in. of the curb, was brought too near the roadway, and that the plaintiffs had only themselves to blame. The plaintiffs said that the regulations of the City authorities allowed them to do so, and that their blind was not a public nuisance as alleged. It had been in use for fourteen years. Mr. Hohler, defendant's counsel, said that the blind should have been within 2ft. of the curb, and not 1ft. Sergeant Tucker, of the City Police, said that blinds might come within 1ft. of the curb, but District-inspector Watson said there was no such rule. The deputy judge said when the streets were dedicated to the public use the shopkeepers had a right to use sun-blinds so long as they did not become a nuisance. The plaintiffs' blind was not a nuisance, as it had been in the same place for fourteen years. He was sorry for defendant's driver, as he did not believe he was guilty of carelessness. Accidents would happen, and it was all the result of the roads being up. Nowadays the roads were always up. The rights of electrical companies and the like were preferred to the public convenience, but it could not be helped. In the meantime the defendant's man had done the damage, and there must be judgment for the plaintiffs with costs. He refused leave to appeal.

WASSENAAR CASTLE, HOLLAND. C. MUYSKEN, ARCHITECT.

The Sale of Two Houses: Alleged Fraud.—At the Coventry County Court recently an action was brought by Mathew Dodwell, of Coventry, against Enoch Green, chief building surveyor to the Birmingham Corporation, to recover damages for concealment of a material fact which, it was alleged, defendant ought to have disclosed on the sale of two dwelling-houses in Berkswell. The amount of the claim was £26 13s. 2d. The plaintiff bought the houses at a public auction, and they were conveyed to him on July 26th, 1900. Before the date of the contract defendant received a notice from the inspector of nuisances to the Meriden Rural District Council requiring him to clean out the ditch into which the property drained and to construct a dumb-well. This was not complied with. The defendant, through his solicitor, was asked in writing: "Has the vendor or his solicitor received any notice from the sanitary authority requiring any work to be done?" and the reply was "No." Plaintiff had since carried out these works, and the cost of these was the amount of the claim. At the time the villas were built the Meriden Council had made no building by-laws, and the defendant laid the drains of his house into the road ditch. Up to that point the Council could not interfere, but as soon as the drains were used a nuisance was created. On the suggestion of His Honour the claim was amended to that of an indemnity in respect of work which had been done since the completion of the purchase. Defendant said he never intended to swindle plaintiff out of a farthing. He even offered to pay £5 towards the cost of the work. He did receive a letter from the inspector of nuisances asking him to clean out the ditch, but no mention was made of a dumb-well. His Honour pointed out that the letter which the inspector of nuisances was said to have written to defendant was not forthcoming, that there was a difference of opinion between defendant and the inspector of nuisances as to its contents, and that in the absence of the document there was nothing to show that defendant had been guilty of fraud. He accordingly gave judgment for defendant with costs.

Pulling down Dilapidated Buildings.—At the Birmingham Police Court John Cartwright was recently summoned to show cause why an order should not be made upon him to take down, repair or secure a boundary wall, and the walls and roofs of washhouses and closets at 3Court, Rea Street South, of which he is the owner, and which are deemed by the city surveyor to be in a ruinous and dangerous condition. Mr. Reay Nadin (from the town clerk's office) prosecuted, and stated the application was made under section 75 of the Town Improvement Clauses Act. The property defendant owned in Rea Street was very old. The boundary wall built upon defendant's land was in a very dilapidated condition. The bricks were absolutely rotten, while the mortar was falling out. A dangerous accident was liable to take place at any time. Two ranges of closets and also some washhouses in the centre of the court were in a similar condition. The ordinary notice to pull the dangerous buildings down or have them secured was served upon the defendant on June 27th, but he refused to comply with it. He (Mr. Nadin) wished the magistrates to make an order to compel the defendant to do the work at once. Mr. F. W. Rinder, the district building surveyor, and Mr. Henry Price, building surveyor, described the bad condition of the brickwork, and expressed the opinion that the only way to deal with the buildings was to have them pulled down. Defendant said it was not necessary to take the property down, and he called a labourer who said that he had been at work in repairing and securing the walls for five or six weeks. The magistrates made an order for the buildings to be pulled down within seven days, and the defendant had to pay the costs of the summons.

The Affairs of Mr. Alfred Gilbert, R.A.—On Thursday last the first meeting of creditors was held under the failure of Alfred Gilbert, R.A., the well-known sculptor. The debtor, who presented his own petition, states that he has been engaged in his profession for the past twenty-four years, the income from which from 1884 to 1894 amounted to £2,000 a year. In the latter year, upon the death of Sir Edgar Boehm, he was engaged by the executors to complete a quantity of his unfinished work, with the result that he neglected his own, and although remunerated did not make the income he had previously made. He was encouraged to undertake big statuary, which necessitated larger premises, and he started building his present studio, to complete which he borrowed £7,500 on mortgage of the premises. Being pressed by creditors about the middle of 1898 he borrowed £2,000, which he paid into a bank in the name of Mr. G. G. Lewis and another, and since that time they had practically controlled his finances. His income from 1898 to the present time had amounted to about £2,700, and he attributed his failure to undertaking larger statuary work which proved unremunerative. He states his debts at £7,000. The assets are stated to be mainly dependent upon the completion of commissions in hand. Proofs to the amount of £6,948 were put in, and resolutions were passed winding up the estate in bankruptcy, with Mr. Lawrence Hasluck, C.A., Holborn Viaduct, as trustee.

Bricks and Mortar.

APHORISM FOR THE WEEK.

An artist has more than two eyes.—SAM SLICK.

Our Plates. THE design for a private chapel by Mr. E. B. Lamb was prepared for a site situated in a very rustic and thickly wooded portion of a park. The aged and infirm villagers in a small agricultural hamlet close by would be permitted to worship here, their own parish church being some distance away, and the whole of the nave west of the transepts (thirty sittings) would therefore be regarded as free. It is cruciform in plan with octagonal transepts. The style is in keeping with the Hall, which was erected at the end of the last century, and the character of a village church has been adopted rather than that for the exclusive use of one family and servants. The seating would be of oak and the walls would be covered with oak panelling to the height of the seats. An oak screen of early Georgian design would be placed at the chancel arch and a handsome oak reredos beneath the East window. The tower is on the south side of the chancel, and would contain a peal of bells. An unusual effect is obtained inside by long angle principals crossing from the piers at angles of aisles outside, obviating the necessity of any piers at the junction of the nave and the chancel with the transepts. The picturesqueness of the cruciform plan inside thus remains, while an uninterrupted view of the whole of the church can be obtained from any part, which (though subject to many objections in a larger building) is of great advantage in a church of such small internal dimensions. The total seating is eighty-five. The view is taken from the south-west. The cost is estimated at £1,000, without the screen and panelling.—The Crown Hotel, Shrewsbury, situate close to the corner formed by the junction of Castle Street and St. Mary's Street, but just within the latter and immediately opposite the General Post Office, formerly a comparatively small establishment, having been acquired by the Church Stretton Hotel Co., has lately been practically rebuilt and greatly enlarged. The front of the hotel, facing the post-office and the side looking on the grand old church of St. Mary, has been entirely rebuilt in half-timbered style, to be in keeping with the old houses for which the town is famous. Over the plain walls and windows of the ground floors stand out the many-paned bay windows surmounted by curiously-carved gable ends. A feature of the front elevation is a monster wyvern, a "fearsome beastie," whose claws hold a shield bearing the name of the establishment, and from whose mouth is suspended a copy of an ancient horn lantern for the electric light. Opening off the entrance hall are a large reading- and writing-room, enquiry and booking office, with telephone, manager's room and a smoking-room bar, so constructed and arranged as to be cool in summer and most cosy in winter. To the right of this is a lofty dining-room 38ft. by 22ft., capable of accommodating 100 people at dinner. On the first floor in the main building are the commercials' dining- and reading-rooms. There are also in the hotel three large private sitting-rooms and over thirty bedrooms, in addition to the rooms reserved for the use of the staff. The electric light, with gas in case of any accident, is fitted in all the sitting- and bedrooms as in the public rooms. The bedrooms are so arranged and the lavatories, bathrooms, &c., are so placed that several suites of rooms can be separately let; and the set of rooms in the block looking towards St. Mary's Church can be quite shut off from the rest of the house. On the ground floor are two large stock and sale rooms, and the offices, kitchens, &c. The architect of the corner building was the late Mr. J. R. Withers, who also was responsible for a great part of the inside work, including the dining-room; whilst the post-office elevation was designed by Mr. Sidney Gingell Jones, of Shrewsbury. Mr. Bickerton, of Shrewsbury, built the corner structure, and Mr. E. H. Nicholas, of Coleham, Shrewsbury, carried out the alterations in the old part of the hotel and erected the new front facing the post-office. The decoration of the dining-room, ground floor, reading-room, hall and bar was the work of Messrs. Cole & Sons, Shrewsbury. The illustrations are from photographs by Mr. W. H. Gilbert, Wyle Cop, Shrewsbury.

The Spire of Yatton Church. THE peculiar shape of the truncated spire of Yatton Church came about in this way. It is said to have been built about the year 1455, and is mentioned occasionally in some of the early churchwardens' accounts. At that time it was, presumably, carried to a point, for when we come to the years 1595–96 the churchwardens' accounts reveal the fact that some portion of it was taken down. Between Michaelmas and Christmas, 1595, it was noticed that something was wrong, for three free masons were got to come and examine it, one of them by the name of Jeninge one of them "of Bristoe," and the other "out of ye forest." The first two of these are paid 2s. each, and the last 6s. while a labourer is employed "for ii dayes work about the steeple" at 1s. a day, and finally twelve pence is given "to the Free Mason in earnest for taking down the steeple." Soon after Easter, 1596, poles and lugges, and a rope which cost 13s. 8d., are bought, and men are employed to cut boughs and lay them on the church. A warrant is obtained from the bishop, and then there follows a number of payments to the plumber and glazier. The stones were apparently taken down and laid on the leads, for three men were employed to remove them from the leads, and another is employed to clean the leads. A feofment or rate of twopence an acre was then made, and brought in £14 6s. 8d., which was a large sum in those days, but there were some delinquents who, a year or so later, had not paid what was due from them. Then follow their numerous payments to the free mason whose name was Jones, but funds seem to have run short, and the wardens borrowed from the vicar, Mr. Clapham, in order to pay Jones. Towards the end of 1596, on February 17th (for the legal year then ended on March 24th), the churchwardens passed their accounts, but there is a note made that "Jones doth owe to the parish for coveringe the steeple vij*s* viii*d*," and apparently he did not complete his work, for between All Saints' Day and Christmas, 1597, there are purchases of "lyme, bordes, and nayles," and a payment of 6s. 8d. is made to John Marks "for covering the steple." The new churchwardens came into office on February 24th, 1597, and they paid a plumber from Bath for mending the leads throughout. This is the last payment in connection with the taking down of the steeple, but a memorandum is made of the persons who have not paid the rate towards it. These entries are sufficient to show that the spire was taken down to a certain point and then covered in, which leaves on one's mind the impression that it formerly rose to a point. Mr. John Harrison, who has investigated these old documents, has not been able yet to follow the history of the spire through all the years which have intervened since, but there is evidence that the battlements round the tower were repaired in 1824–5, when the bells were made a peal of eight; and that the weathercock was then erected on the spire either for the first time or after having been taken down for repair. At present the spire is being rebuilt, owing to its being in a very bad condition, but great care has been taken to preserve its shape, and to replace every sound stone exactly in the place from which it was taken.

The Caerwent Excavations. THE excavations at Caerwent are in full progress at the present moment; and although the houses uncovered during the past two years have been again covered up, the results of this season's work are such as to amply repay those who are interested in the history of Roman Britain for the trouble of making a pilgrimage to this ancient site. These results are, mainly, a house of unusual size in the south-west quarter of the city and the gate in the north city wall, which, as regards the extent of its preservation, is perhaps unique. The excavations will if possible continue till October, and will (if funds allow) be reopened early next year. The Fund has a very promising site of at least four acres secured for further excavations, but no means for providing for the expenses of labour are as yet furnished. Descriptions and plans of the previous work are now in the press, and will appear in the forthcoming volume of "Archæologia." The nearest station is Severn Tunnel Junction, and the postal address Caerwent, near Chepstow. Mr. A. T. Martin, hon. secretary, Clifton College, is now in residence superintending the work, and will be pleased to answer any communications on the subject.

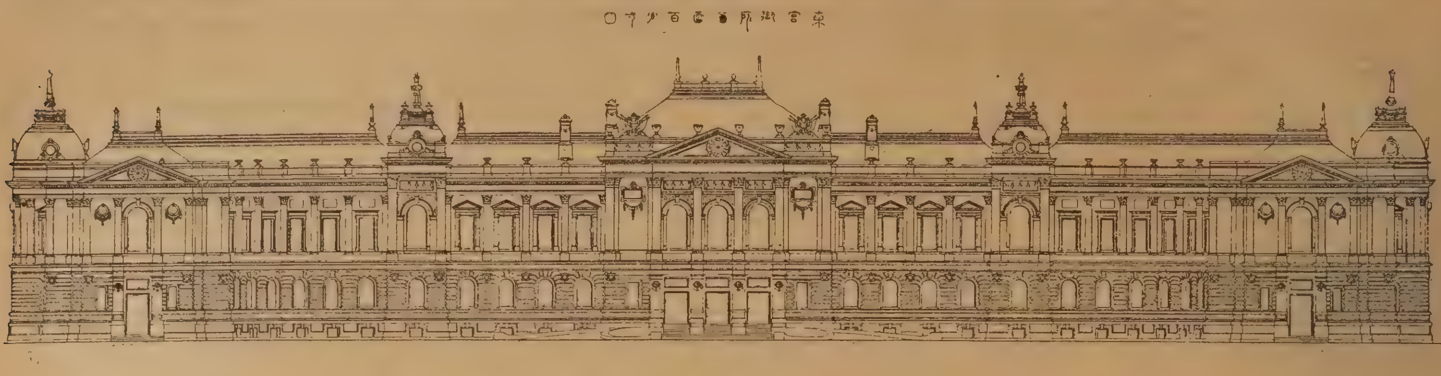
The New Gaiety and Mr. Norman Shaw. AT Spring Gardens is to be seen a small and carefully-built model of the first instalment of the Strand end of the new avenue—the western corner of the great crescent which will be occupied by the New Gaiety Theatre, the Gaiety Restaurant and Short's. In the designs for these new buildings a curious difficulty arose. The theatre at the corner, diving deep beneath the surface, had no aspirations towards loftiness, but the restaurant had towering ambitions, and so had Short's. Consequently the theatre, which will occupy the most conspicuous place at the corner, offered a stunted aspect beside its neighbours, and the general effect was well-nigh ruined. In this emergency Mr. Norman Shaw came modestly forward, being invited to make a suggestion. He ran a loggia round the summit of the theatre, passing through the domed tower at the corner. The suggestion, which simply and instantly gave unity to the general design, was enthusiastically welcomed, and the model at Spring Gardens promises at least one point of architectural dignity. When thanked by a leading member of the Improvements Committee who professed a desire to do something for London, Mr. Norman Shaw merely replied, "Do you think you are the only people who want to do something for London?"

Birmingham Artizans and the Crafts. THE artizans of Birmingham, working through the medium of their trades council, have organised a movement for providing bursary scholarships for the children of their class in the Birmingham University. In furtherance of this object a polytechnic exhibition was opened recently at Bingley Hall. Primarily the exhibition is designed to illustrate the variety and distinguishing characteristics of local manufacturing and commercial pursuits, and incidentally it presents a microcosm of the educational system by which invention, research, craftsmanship and artistic attributes are cultivated in the youth of Birmingham. The numerous objects of local manufacture make a very interesting collection, the attractiveness of which is enhanced both from the educational and from the mere sight-seeing standpoints by the demonstration of some of the processes. Many artisans contribute specimens of their own handiwork which serve to show the value of the work of those municipal and other agencies which are labouring to evoke and discipline the artistic instinct in conjunction with manual dexterity. There is a comprehensive exhibit setting forth the work of the students at the municipal technical school, and another from the municipal school of art. The West Bromwich Municipal School of Art also co-operates in exemplifying the work which is being done in giving a practical turn to the artistic resources of the district. The efforts of the artisans to make the exhibition successful have received the active support of the University authorities. Professor Lapworth has arranged a geological section and Professor Bridge is responsible for a natural history display. The Chancellor of the University, Mr. Chamberlain, has expressed his hearty approval of the object in view and his good wishes for the success of the scheme; while the principal, Dr. Oliver Lodge, has given active help to the promoters.

A Bradford Memorial to Queen Victoria.

MR. ALFRED DRURY, A.R.A., has prepared a model of the statue of Queen Victoria which is to be erected as a memorial of her late Majesty at Bradford. The statue will be placed in Victoria Square. As that space now stands the upper portion—a plot of ground which was formerly the graveyard of Horton Lane Chapel—is terraced, and a flight of steps, not at present available for the public, has been constructed to afford access from the garden below. These steps will now be removed and their site will be occupied by the large statue of the Queen. The statue will be of bronze, and will represent the Queen in her state robes as she appeared about 1887. Her Majesty holds in her hands the sceptre and globe, and wears a small imperial crown, and a widow's veil falls back over her ermine collar. The statue stands on a pedestal flanked by architectural works which are simple and dignified in design. Below the figure and raised only slightly above the level of the existing garden, upon a spacious stepped platform, will be a semicircular space, enclosed by low walls, and forming a small ornamental basin fed by fountains. The fountains will be wholly decorative in character, the intention being that the statue of the Queen, while it is the purpose of the whole work, shall also be the main artistic item in the composition. Any attempt at allegory or story-telling is therefore avoided. The principal fountain supplying the basin will, according to the present design, represent the head of Neptune, having on either side life-sized figures of children holding fishes. From the mouths of the fishes and of Neptune will spurt jets of water falling into a large scallop shell and overflowing into the basin. On either side of this central composition will be small drinking-fountains decorated with female heads and dolphins. These sculptural groups will, like the statue and the plinth on which it stands, be in bronze, and the architectural work will be of Yorkshire stone brought to a high finish. ¶ The whole work will be of heroic proportions. ¶ The Victoria Square, with the roads with which it is

CHARTRES CATHEDRAL: THE FLYING BUTTRESSES.



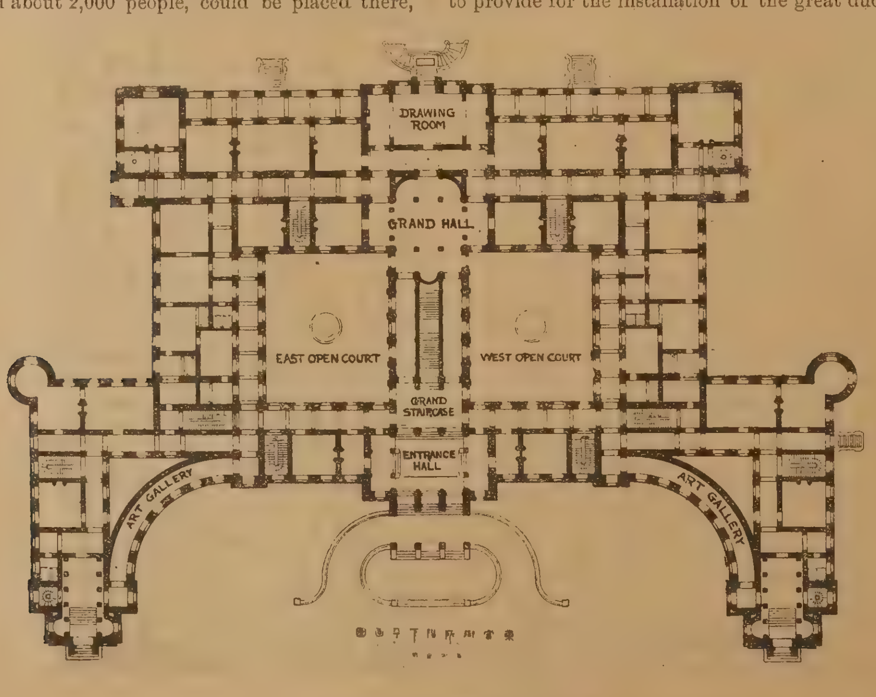
DESIGN FOR THE NEW IMPERIAL PALACE AT TOKIO, JAPAN. DR. TOKUMA KATAYMA, IMPERIAL ARCHITECT.

surrounded, occupies a considerable area, and any small composition would be dwarfed by the surroundings. Horton Lane Chapel is a large building which will necessarily from most points of view form the background of the memorial. The statue itself will be 9ft. 6in. in height, independently of the bronze plinth, which will add another 15in. The architectural work from the platform to the base of the plinth will be 11ft. in height, and the whole of the architectural composition will be some 36ft. from side to side. Upon the face of the architectural pedestal it is proposed to place three bronze tablets. Mr. Drury expects to have the statue and the sculptural works ready within about a year.

The Abbey and the Coronation. MR. SOMERS CLARKE thinks that the arrangements for the Coronation ceremony in Westminster Abbey should be of such a character as to avoid many objectionable features that have characterised its predecessors. He protests against the "monstrous blockade of galleries in every possible and impossible corner." In view of the fact, he says, that the ceremony is of a religious character; that it takes place in one of the most beautiful churches in the world; and that unless it be conducted with dignity it had better not be done at all; is it right to cram in, at the risk not only of their own lives but of the lives of the royal personages, twice as many people as the place will reasonably hold, merely that they may be spectators? Treated with decency and reverence, he continues, the place will accommodate perhaps 5,000, and the rest can be very adequately accommodated elsewhere. The remedy he proposes is the elaboration and enlargement of a structure which has on previous occasions been erected at the west front of the church. A large and stately hall, to hold about 2,000 people, could be placed there, wtih waiting-rooms attached, and as it would stand in the open, abundance of stairs could be arranged for the safety of spectators, whilst the structure itself could be composed of incombustible materials. In addition, he suggests that Dean's Yard, Poet's Corner, and St. Margaret's churchyard could be enclosed and covered in as assembling and waiting-places for the spectators.

A JAPANESE PALACE.

WE give on this page the front elevation and ground-floor plan of the new palace now being erected at Tokio, Japan, for His Imperial Highness the Crown Prince from designs by Dr. Katayma, imperial architect of Japan. This building, costing more than £600,000, will be one of the largest palaces in the world; and while being built primarily as a residence for the Crown Prince, it is also intended as a memorial to the reign of the present Emperor. It is, besides being thoroughly fireproof, also earthquake-proof; this being accomplished by the erection of very heavy walls tied and supported by a most elaborate system of steel construction. The greatest care has been taken in the planning of every detail to make the palace not only a work of art, but a luxurious semi-public building for the entertainment of Japanese royalty. The great banqueting hall is on one side of the building and the ball-room on the opposite side. The reception-rooms, apartments of His Imperial Highness and Her Imperial Highness, the smoking-room, and several suites throughout the building, will be equipped with the most modern hygienic and sanitary appliances, especially as regards the heating and ventilating plant by Messrs. Walker & Chambers, of New York. It required much study and skill to provide for the installation of the great ducts and pipes for the supply and discharge of air to and from the several rooms and not to interfere with the special "earthquake-proof feature." It has all been accomplished very ingeniously, and the plant itself is an elaborate one. The architect and his consulting engineers sought the best talent in America and Europe in connection with this important matter of heating and ventilating.



GROUND-FLOOR PLAN.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Architectural Handbooks.

H. R. writes: "Kindly recommend some good books on (1) styles of lettering for plans, &c.; (2) colouring perspective sketches, &c., and (3) a waistcoat-pocket architects' and surveyors' handbook."

(1) "Alphabets, Old and New," by Lewis F. Day (3s. 6d. nett). (2) "Hints on Architectural Draughtsmanship," by G. W. Tuxford Hallatt (1s. 6d.). (3) "Architectural Surveyor's Handbook of Formulæ, Tables and Memoranda," by J. T. Hurst (4s. nett). These can be obtained from Mr. B. T. Batsford, of 94, High Holborn.

Laying Wood-Block Floors.

GLASGOW.—R. R. writes: "Kindly give information about the materials required for laying wood-block floors; also the method of laying the blocks, and the names of firms who supply the composition."

In laying wood-block floors the area to be floored should be excavated to a depth of 6in. or 8in. below the intended floor-line, and then levelled and well rammed. Stakes should then be driven into the ground about 6ft. or 8ft. apart around the space, with their heads levelled to the required height of the concrete, which should be poured in, rammed, and struck off to the tops of the stakes. After allowing a few days to elapse, screeds of cement 3in. wide and 1in. thick should be run around about 6in. from the walls, carefully levelled and made straight with rules. The whole space should then be floated with Portland cement and struck off from the screeds to a level surface. When this is dry it should be swept clean, and (about 2ft. at a time) be well covered with boiling tar. Dantzic red deals, "flatted," make good blocks, so also do Gefle white battens; pitch-pine wears well but splits in drying. The blocks of wood should be ploughed all round, and loose tongues inserted when laying. The blocks, previously baked, should be dipped into a kettle of tar to a depth of half their thickness, and quickly rubbed into position, a few taps with a hammer being given to consolidate them. If the tar is thin a little pitch may be added to stiffen it. The work should be commenced at the farthest corner from and finished at the doorway. You should apply to the local sawmills for prices of wood blocks. There are several patent systems of wood-block flooring the manufacturers of which can be found in Laxton's or Lockwood's price-books, and most of these would also be willing to quote you for plain blocks.

Architectural Engineering.

Dumpy Level writes: "I have been articled for three years to an architect and surveyor, and am now an assistant in an architect's office, where, I believe, I am giving satisfaction. I have, however, no liking for the profession, at any rate not for its artistic side, as my tastes lie in the direction of engineering, both civil (so-called) and mechanical. I am nearly nineteen years of age, and, I think, an accurate and delicate draughsman (*sic*) and good land surveyor. I have received a good general education, and have a fairly wide, though in most cases cursory, knowledge of scientific subjects. My ambition is to become a civil engineer. What course would you advise me to follow, taking into consideration the fact that I could not well afford to accept a situation with a salary of less than one pound, or at the very least fifteen shillings, a week? Please also recommend me a practical book on builders' book-keeping, also a good book on specifications the price of which does not exceed 7s. or 8s."

"Dumpy Level"—an architect's assistant, aged nineteen years, with anti-artistic instincts, fostered by an ambition to be a civil engineer, and withal an accurate and delicate draughtsman, and a good land surveyor (does not he tell us so?)—is not modest. "Dumpy Level" must be more patient; he must wait awhile, for "practice makes perfect." We do not advise you to abandon all the knowledge which you have been acquiring during the last few years and to start afresh as a civil engineer. If, as you say, you have a liking for engineering, there is plenty of opportunity to satisfy your desire, for there is such a thing as architectural engineering (the designing of iron roofs, bridges, &c.), and you could thus profitably employ the knowledge you now possess (see the replies under the heading "Theoretical Mechanics" on page 122 of our issue for March 20th last; under "Architectural Training" on page 346 of our issue for June 5th; under "R.I.B.A. Examinations" on p. 477 of our issue for January 23rd, 1901, and under the heading of "Scientific Masonry" on p. 11 of ou rissue for August 14th. There is no *practical* book on builders' book-keeping. "Specification No. 4" (published at these offices, price 5s. nett) will exactly suit your needs.

Measuring Paintwork.

Warrington—H. & S. C. write: "What would be the proper measurement for cornice (one coat of paint) of 1ft. 9in. girth? We measure all below the underside of cornice into sq. or super. ft., but we consider treble measurement allowable for an enriched cornice."

We consider that it would be only a fair measurement to take the cornice treble, but a price per sq. yard is usually given for the room as a whole, measured by the length of walls and height from ceiling to floor, or the wall taken separately and the cornice at per ft. run.

The Temple at Eleusis.

Taunton—D. P. A. writes: "I should be glad of any information about the temple at Eleusis (general plan, &c.) from which Mr. Phené Spiers takes the Ionic Order given in his book on the Orders."

See page 93 of our issue for September 5th, 1900.

Land Surveying.

Ipswich.—Area writes: "I presume that in the table given in 'Practical Surveying' on Land Quantities, that 10 sq. chains equal one acre, Mr. G. W. Usill refers to Gunter's chain of 66ft. and not to the 100ft. chain which is sometimes used."

Gunter's chain of 66ft. is referred to.

Measuring Internal Plastered Work.

Nottingham.—F. W. writes: "Which is the correct way to measure the plastered work of a room 10ft. 5in. high with a cornice which works down the wall 6in. and a skirting 11in.? Should it be measured from the top of the skirting to the under side of the conice; also, should the ceiling be measured inside the cornice or between the walls? Should the fireplace openings be deducted?"

Measure between skirtings and ceiling, or, if rendered behind skirtings, measure all in from floor to ceiling. The correct way is to deduct from the ceiling the projection of cornice at one side and end, but this is generally neglected unless the cornice is unusually large, say, of 24in. girth. Cornices of not more than 12in. girth are taken by the foot run; if larger than this, by the foot super. If they do not exceed 12in. in girth the length of walls will be sufficiently exact for length of cornice; but when the girth is more take the mean length. Number all mitres, stopped ends, mitred and returned ends, stating girth of cornice, and circular corners, stating girth of corner and cornice. Plastering in small quantities is kept separate from the rest and measured by the super. foot instead of by the yard. No deductions are usually made for chimney openings, this being considered equal to making good, but if deducted add for making good.

Green Stain for Wood.

Sunderland.—Enquirer writes: "Some red pine was stained green and varnished two coats. The green colour is fading (the wood being near the window) and parts are turning yellowish-brown. What is the cause of this? I have some more woodwork to stain. What stain will be the best to use?"

You do not state the composition of your stain, but we presume an analine green was used. Analine colours will not stand, as exposure to the atmosphere causes them in time to fade and turn into a brown resin. It is difficult to recommend a green stain. We do not know of one good in colour that will last. A solution of verdigris or chrome green might be used. Then there are Brunswick green and green verditer, but these are more in the nature of paints. You could also turn the wood yellow by brushing with a solution of nitric acid, *i.e.*, aqua fortis, and then stain it blue, say, by using Prussian blue. See reply about "Green Stain" on page 388 of our issue for August 2nd, 1899.

Site for Houses.

Heywood.—Enquiry writes: "Which will be the best site on which to build two houses, as per enclosed sketch (not reproduced)? The site is almost the highest point in Heywood. You will see that the living-room will be the most important room."

The south side of the road is the most suitable; the living-room will then face the south and obtain plenty of sun, and the front room will face the road. The kitchen is in an awkward position in both houses, but the one with the kitchen window facing west is the better of the two.

Buildings in Lancashire and Cheshire.

Manchester.—J. H. writes: "I should be glad to know (1) whether the oak screen (date about 1640) in Cartmel Priory Church, North Lancs., is a suitable subject to measure for the R.I.B.A. Final Examination; and (2) I should also be glad of any suggestions of work to measure in Cheshire or the surrounding counties."

(1) Yes. (2) Illustrated articles on Lancaster and the neighbourhood appeared in our issues for August 11th and 18th, 1897. In Cheshire the following Elizabethan mansions are worthy of note: Bramall Hall, near Stockport; Brereton Hall, near Sandbach; Crewe Hall, the seat of Lord Crewe; and Eaton Hall, the seat of the Duke of Westminster. Then there are Chester Cathedral, the old half-timber houses of Chester, and Wrexham Parish Church. If you consult any good archæological record of the county, you will be able to select many more Early English Renaissance and Gothic buildings that are worth measuring.

The Monument to the late General Sir William Penn Symons, now in course of erection in the Victoria Gardens, Saltash, will be built of granite from the Merivale quarries, and will be surmounted by a carved crown heavily gilded. At the base will be empanelled a bronze medallion bust of the late general, designed and executed by Mr. Alfred Drury, A.R.A.

New Patents.

These patents are open to opposition until October 8th.

1900.—Instrument for Setting-out Curves.—11,666. H. Fischer, Ansbach, Bavaria. This instrument is to all intents a simple form of theodolite minus the ordinary telescope and fine-sighting adjustments. It is designed for approximate measurements of angles to be used for projecting curves, but it can also be used for approximate surveying, and has the advantage, where great accuracy is not required, of being inexpensive.

Plastic Decorations.—13,602. H. Schudt, 51, Savigny-Strasse, Frankfort-on-Maine, Germany. A dough-like mixture is used of (say) 70 per cent. of chalk, 10 per cent. of a mixture of glue, resin and varnish (say 4 per cent. glue, 3 per cent. resin and 3 per cent. varnish), and 20 per cent. of boiled linseed oil combined with colouring matter of the desired shade. This is applied in successive layers with a brush. For very sharp effects a filling material is employed, such as string or wire. The decoration remains uninjured by exposure. No moulds are used.

Sculpture-copying Apparatus.—13,640. F. Denny, 20, Corbyn Street, Hornsey Road, London, N. By this apparatus pieces of sculpture, carving, ornament, &c., can be copied, either enlarged, reduced or of the same size as the original; carving, for example, can be worked by the machine on the face of a building. The invention consists of two similar and opposite shafts with two similar and opposite pantographs, all movable on one pivot and controlling the opposite ends of a tracer-rod and cutter-rod. A contrivance is also provided for undercutting.

Concrete Piles.—15,932. G. L. Mouchel, 38, Victoria Street, Westminster, S.W. This invention relates to connecting two or more lengths of pile. Hitherto, if a concrete pile driven into the ground was to be lengthened, a timber mould was built up on the head for moulding the new length—an expensive work, and one involving loss of time, as the new length must set for about a month before driving can be recommenced. According to this invention the pile is moulded in separate lengths, each with a central socket and core-piece at the ends, an iron collar securing the whole. When the pile is driven home grout is forced into the space between the core-piece and the socket, and this completes the connection.

Wood-Paving Blocks.—17,448. J. A. Brodie City Engineer, Liverpool. To prevent the blocks being forced up, "dogs" are fixed between them. These "dogs" are metal stampings or castings having three spikes projecting at each side of a centre plate, which serves to separate the blocks for the pitching.

Fire-grates.—18,459. J. Alves, 50 and 51, Lime Street, London, E.C. The grate has an air-chamber at the back, or at each side, in direct communication with the ash-pan.

1901.—Sash Cords.—8,465. R. A. Ray, 94, Cleethorpe Road, Great Grimsby. The cords are made of six or more fine steel wires and one or two copper wires of a similar gauge, combined with a soft cotton, hempen or other cord. Such cords are claimed to be more durable and more pliable.

Lavatory Basin Frames.—9,141. G. D. Innes, Hyde Road, Ardwick, Manchester. The frame is made in three parts to suit basins of different sizes.

The following specifications were published on Saturday last, and are open to opposition until October 14th. A summary of the more important of them will be given next week.

1900.—14,091, Lovett, sanitary van. 14,278, Passow, process for producing first-class cement. 13,211, Thorp & Marsh, gas-pressure recording apparatus. 15,349, Dutton, guards for wood-cutting machines. 15,769, Holdsworth, Midgley & Holdsworth, vehicles (known as timber-wheels) to expedite unloading. 16,109, Smyth, apparatus for manufacturing acetylene gas. 16,572, Lewis, combined mallet and rule. 16,661, Leisering, varnish can. 17,315, Parkes & Appleby, latch and other locks. 17,593, Leach gulley traps. 17,726, Henry Brook & Co., Ltd.,

& Sykes, traps for street gulleys. 17,890, Sherwin, lavatory basin overflow passages. 17,907, Parker & Parker, sash-windows. 18,098, Robertson, cranes. 18,840, Watson, refuse destructors.

1901.—481, Drouillard & Scully, ventilating water-closets. 6,839, Nash, die for making bricks, tiles, pipes, &c. 11,068, Mörth, dust carts. 11,651, Long, guards for circular saws. 11,679, Delehanty, pipe connections chiefly designed for water-closets. 13,111, Heaton & Boice, machine for tonguing or grooving lumber. 13,776, Midgley, sash-fasteners. 13,817, Wuhrmann, wooden blocks or prisms applicable to mosaic slabs or boards.

Engineering Notes.

The Construction of the Keyham Harbour, Devonport, Extension has been secured by the Thames Ironworks against five other competitors. The amount of the contract price is said to exceed £400,000.

Elevators at Buckingham Palace.—The contract for the supply and erection of elevators at Buckingham Palace has been placed with the Otis Elevator Company, 4, Queen Victoria Street.

Change of Address.—The Pulsometer Engineering Co., Ltd., has removed its works and offices from Nine Elms, S.W., to Nine Elms Iron Works, Reading, Berks. The offices and showroom at 63, Queen Victoria Street, London, E.C., are still retained.

A New Bridge at Allanaquoich, Braemar, is proposed to be erected by the Aberdeen County Council. The design shows a road bridge about 95yds. higher up the stream, with concrete piers carrying steel girders covered with pitch-pine in a single span of 50ft., at an estimated cost, including diversion of road and formation of retaining walls, of £200.

Bursting of a Water Main.—In Finchley Road, Hampstead, last week, a water main belonging to the West Middlesex Waterworks Company, and situated immediately over the main-line tunnel of the Midland Railway, burst. The water main, which is one of three supplying a large district, is 15in. in diameter and about 2ft. below the surface of the roadway. The pressure of the released water caused the upheaval of the wood pavement to the height of 18in. across the roadway, and the heavy granite kerbstones of the footways were displaced and broken. The wood-paving blocks were displaced for a distance of over 300 yards, and the water spread across the road and paths, in some places reaching to the doors of the shops on both sides. The flow of water continued for half an hour, and a large volume penetrated to the tunnel below, through which runs the goods lines of the Midland Railway. The structure, however, was not damaged, and no suspension of the traffic was necessary. The vehicular traffic along the road had to be diverted, and cannot be resumed until the wood-paving has been relaid. The flow of water was stopped by the cutting off of the supply at the pumping station at Barrow Hill Road.

Steel Works in Japan.—The Imperial Selet Factory at Wakamatsu was founded in April, 1900, and commenced in February last the manufacture of pig iron, and in May the work of manufacturing (about 40 tons a day) Siemens' steel. Two of the five roll mill plants having been completed, the production of medium and small rails and plates was started towards the end of June. The other plant will be completed by the end of September, and the manufacture of large rails and other ware will be started at once. It is estimated that 90,000 to 100,000 tons of steel could be produced in a year, when all the arrangements shall have been completed, and the operations can be carried out to their full extent. Next year the factory will use iron obtained from Akiya in Echigo, where ore has been found, stated to be equal in quality to the best imported mineral.

A Fatal Crane Accident, which resulted in the death of three men and serious injury to a fourth, occurred at the North-Eastern Railway Company's Central Station Hotel, Newcastle-on-Tyne, last week. An addition is being made to the hotel, and there was a jib-crane in use for the construction of the building, consisting of an upright and a movable arm, the jib working in a socket and having a rise and fall of about 65ft. from the vertical to the horizontal position. Beneath this jib a small crowd of workmen, numbering about thirty-five, were engaged in mixing cement and in other occupations. The jib gave way owing to causes not yet ascertainable and fell amongst the men, killing three outright and very severely injuring another. The accident caused great excitement, occurring as it did in one of the busiest thoroughfares. The victims were so tightly held down by the jib that much difficulty was found in extricating the bodies. Had the jib fallen 15in. to the south-west, neither fatality nor injury would have been caused by the accident.

The New Harbour Works at Montevideo.—July 18th last was a great day for Montevideo, as on that day the foundation-stone was laid of the new harbour works which, it is hoped, will more or less restore the lost position of Montevideo as the principal port on the south-west coast of South America. The site selected for the inaugural ceremony was a large vacant esplanade at the extreme east point of the city, whence will spring the main breakwater of the new port on the eastern side, in a direct line with Calle Sarandi, the dividing street of the "old" city. The port works, though they require from six to eight years for their completion, will have a stimulating effect on commerce and industry, promoting a return of general prosperity and progress. The new port is being constructed by a French syndicate formed *ad hoc*, consisting of MM. Allard, Cirseau, Couvreux, Dollfus, Duparchy and Wiriot, names all well known in engineering and financial circles. The contract price is 9,916,336 dols. gold—say, £2,115,000—but the State has to provide dredging material to a sum not exceeding 4,900,000f. The plans for the works were drawn up by M. Guerard, of Marseilles, and Herr Kummer of Hamburg, on the basis of surveys made by Luther & Co.; and Herr Kummer has accepted the post of technical inspector of the works. The funds are provided by special import and export duties yielding about a million gold dollars per annum, on the guarantee of which port bonds will be issued and will be taken up by the contractors themselves at current rate.

Indian Irrigation.—In view of Lord George Hamilton's announcement that a Commission, to be presided over by Sir Colin Scott-Moncrieff, is being appointed to lay down rules for the interlacing, encouragement and control of irrigation works in India, the figures given in the annual review of irrigation issued at the end of last month in India are of interest. From them it appears that twenty-two of the large productive works realised a nett revenue amounting to 9·52 per cent. on the capital outlay, while thirteen others yielded only 0·79 per cent., reducing the average return to 7 per cent. The total area of the crops irrigated or protected exceeded 18½ millions of acres, being an increase of over three-quarters of a million during the year. The principal enhancements were in respect to the Punjab canals, the area irrigated there exceeding all previous records by over 300,000 acres, while the nett return on capital in respect to that province was as high as 10·24 per cent. Still more gratifying results may be looked for in the current year, since the great Jehlum Canal, begun in the autumn of 1898, is to be formally opened in October, and will irrigate a vast tract of country lying between the Chenab and Jehlum rivers, a great portion of which has hitherto lain waste. Other large projects are being carried out in the Punjab. The total surplus revenue earned since irrigation works were undertaken by Government has been nearly ten million sterling. This is the purely financial result of irrigation, regarded as an investment, and the figure quoted has no reference to its economic value in increasing food supplies, in preventing famine and in strengthening the position of the owners and occupiers of the land. Neither does it take into account the increase of land revenue received by the State as a result of bringing waste tracts under cultivation.

Keystones.

Mr. Hamo Thornycroft's Colossal Statute of Alfred the Great is to be unveiled at Winchester on September 20th.

The Devonian Club have elected Mr. C. H. Brodie, A.R.I.B.A., as the secretary in succession to Mr. George Wreford, C.C.

At the Union Infirmary, Great Dunmow, Essex, new bathrooms and iron staircase will be erected from the designs of Mr. Richard Creed, of 11, Finsbury Circus.

Mr. D. W. Stevenson, R.S.A., who has just been commissioned to execute a statue of Burns for Toronto, is one of two brothers who follow the profession of sculptor, W. G. being a painter also.

A New Organ is to be erected at the expense of the Chinese Government in the chapel at St. Augustine's College, Canterbury. The instrument is to be a memorial of the Rev. Sydney M. W. Brooks, formerly a student at St. Augustine's, who was killed in China last year.

In the Church of Stoke-Bruerne, Northants, a baptistery has been formed at the south-west end as a memorial to the late Mr. George Savage, a former churchwarden. The baptistery has been surrounded with wrought-iron railings of suitable design, and the font has been transferred there from its previous inconvenient position. Other improvements have been effected.

The New R.C. School at Wishaw, in Graham Street, has been erected to accommodate 500 scholars, and has cost £4,000. It has a frontage of 104ft. and a depth of 49ft. The lower flat contains four classrooms for the junior department, also masters' and mistress's retiring-rooms, closets and lavatories, children's cloakrooms and working-rooms. The stairs on either side lead to the upper departments.

A Monument to Nadejda Dourova is to be erected in Elabouga, Russia. The father of this remarkable woman was a captain of cavalry, and at the age of twenty-three she enlisted in a Lancer regiment as a man and was known as Sokolov. Later her sex was discovered, and she was recalled to St. Petersburg, but the Emperor, hearing the circumstances and seeing her, authorised the Amazon to remain in the army in a regiment of Hussars under the name of Alexandrov. As an officer she distinguished herself in the campaign against Napoleon in 1812, being wounded at Borodino, and received the Cross of St. George.

Archæology in Greece.—It has been decided that invitations to a Congress of Archæologists, to be held at Athens in April, 1903, shall be issued by a committee, composed of the Minister of Public Instruction and the directors of the French and German Archæological Institutes, with the Crown Prince as honorary president. The subjects of discussion will be notified beforehand. Five meetings will be held at Athens, and ten other meetings during excursions to Olympus, Delphi and other places of antiquarian interest. The invitations will be addressed to all Governments, academies and universities in the world. It is estimated that about five hundred delegates will attend the congress.

In St. Day Church a new altar and choir stalls have been placed at a cost of £150. The improvements in the chancel consist of the substitution of masonry steps and floor, in place of the wooden structure that existed formerly. These steps, three in number, have granite risers, whilst the treads and floor are paved with dark-red encaustic tiles of mosaic pattern. On the floor a daïs formed of granite kerb and tile pavement supports the new altar, which is a beautiful specimen of ecclesiastical carving. It is of oak and is a replica of that in the recently restored church at Kea, excepting some slight modifications in measurement, rendered necesary from the fact that this stands in a semicircular apse. The front of the altar is divided into five spaces for panels, the upper and lower parts of which are filled with tracing of intricate design. The painting of these panels is the work of a member of the choir, Mr. Harry Brock. The new choir stalls, also of oak, are of Gothic design.

For a new Grammar School at Holt, Norfolk, the designs of Mr. Chatfeild Clarke have been accepted by the Fishmongers' Company.

Mr. G. D. Martin is the architect of the new buildings about to be placed on the site recently occupied by the Roman Catholic Church, Moorfields.

Cottage Homes are to be erected by the Bermondsey Guardians for the poor children of Bermondsey, at a cost of £148,000.

The Guildhall Art Exhibition.—The exhibition of works of Spanish artists which has been on view at the Guildhall since May 1st closed last Wednesday with a total attendance of 305,000 persons. The attendance was higher than at any previous picture exhibition held under the auspices of the City Corporation.

Mr. Charles Abbey, a well-known architectural sculptor, passed away at his residence at Rosemont Road, Richmond Hill, on August 21st, in his sixty-sixth year. He was widely and deservedly respected in his profession. For some years he was partner in Dublin with Mr. Charles W. Harrison, now senior member of the firm of Messrs. Harrison & Sons, monumental statuaries, of Great Brunswick Street, Dublin.

Pocklington Church is undergoing a long-needed restoration. The architect is Mr. John Bilson, F.S.A., of Hull, whose name will be a sufficient guarantee that the work will be carefully and well done. The condition of the fabric is very bad. The roof of the nave might at any time have fallen in, and if this had happened during service it would have repeated that sad and fatal disaster which occurred at St. Mary's, Beverley, on the third Sunday after Easter, 1520. The pews are worm-eaten and rotten, and cannot be put back.

A Protest against a Board School Site.—Poplar is protesting against the London School Board's proposal to spend some £66,000 in building a school on a most unsuitable site—some waste land by the dismal Lea at Bromley-by-Bow, close to the stables of the London General Omnibus Company. At a recent meeting of the Poplar Borough Council the site was described as a rubbish shoot. It is also unsuitable in situation and in other respects. Yet the School Board have given nearly £6,000 for the site and propose to pay £60,000 for a school on it.

A New Public Hall at Kingswells, Aberdeen, is being erected by the side of the public road, nearly opposite Kingswells United Free Church, the west side of the building facing the road leading to Fairley and Cloghill. It is to be a plain structure, estimated to cost nearly £1,000. In the basement provision is made for cooking, and there is other accommodation which will be used as a storeroom. On the ground level, entered from the public road, there will be a large hall capable of accommodating from 450 to 500 people and a small hall to contain about 100 persons. Considerable progress has been already made with the work, the walls being almost completed and joists for the flooring being laid. The contractors are: Mason, Mr. David Main, Aberdeen; joiner, Mr. Alexander Hall, Mile End, Aberdeen; slater and plumber, Mr. S. Christie, jun., Dyce; and painter and glazier, Mr. G. Bowman, Inverurie.

New Offices for the Tottenham and Edmonton Gas Light and Coke Co. have been built recently from plans prepared by Mr. John S. Corder, of Wimborne House, Ipswich. The style is a free treatment of German Renaissance. The structure rests on a rough granite base 4ft. high, and above this the construction is of red bricks, relieved by red Ballochmyle stone, yellow Mansfield stone and Gunton's terra-cotta. The roof is of Broseley tiles, whilst the flats at the back are concrete and asphalt. Special difficulties arose in connection with the building from the fact that the Moselle Brook runs completely under the foundations, and great precautions had to be taken to ensure the safety of such a heavy structure coming in such close proximity to it. The building has two important street-frontages, and the principal front is relieved by a large projecting porch surmounted by a carved pedimented gable, and a smaller gable of similar design is placed between the porch and the angle of the building. At the corner a large octagonal oriel is constructed, springing from a stone corbel. The clerk of the works has been Mr. Harry Cockrell.

Municipal Turkish Baths are to be erected by the Camberwell Borough Council in the Old Kent Road. The cost is estimated at £3,000.

A New Organ in St. John the Baptist Church, New Springs, has been erected at a cost of about £700. It has been built by Messrs. Peter Conacher & Co., of Huddersfield.

St. John's Church, Gainsborough, is to be enlarged by lengthening the nave by three bays at an estimated cost of £2,500 to £3,000. It will provide seats for 240 more people, the present accommodation being for 450.

Alterations in the Fortifications of Langres have brought to light a gate built in the year 301. It is a splendid specimen of Gallo-Roman art, somewhat similar in style to the Roman gates at Reims and Autun, and consists of two arcades (Reims has three) and five Corinthian pilasters.

A New Roman Catholic Church is being erected at Downall Green, Liverpool, in memory of the late Mr. John Mercer, J.P., of Alston Hall, near Preston, founder of the Park Lane Collieries, who left £6,000 towards the erection of the church. The building, with a presbytery, will cost about £10,000.

Anne Boleyn's Castle—also known as Green Street House—East Ham, which is to be converted into a Roman Catholic mission, is a large red-brick mansion, supposed to occupy the site of a seat of the Nevill family. Its most conspicuous feature is a tall tower surmounted by a cross, and here tradition asserts that Anne Boleyn was imprisoned before being taken to Greenwich and thence to the Tower. Another story is that Anne was betrothed to a young nobleman who died, and during the period of mourning Henry VIII. built the tower for her amusement.

St. Paul's and Wren's Prophecy.—In view of the recent discussion regarding the stability of St. Paul's Cathedral, the following passage from an article in the "Lady's Magazine" for August, 1798, headed "Anecdotes of Sir Christopher Wren," is of interest: "This great master of architectural composition always said that if the dome of St. Paul's settled it would settle towards the south. This has taken place as Sir Christopher predicted in consequence of their not allowing him stone as he desired, instead of rubble, to sill up the piers, which are bound round at the bottom with an iron chain let down into melted lead."

The International Exhibition at Wolverhampton will be held next year. Lord Barnard has granted part of the site, and an area of over thirty acres is made up of a portion of the park, including a lake belonging to the town. Mr. H. A. Hedley, the general manager of the Glasgow Exhibition, and Messrs. Walker & Ramsey, the architects of part of the buildings of that undertaking, are now engaged in maturing the plans of the halls in which the exhibition is to be held. Intending exhibitors are reminded that applications must be received not later than October 1st next, at Gresham Chambers, Wolverhampton.

A New Wesleyan Chapel at Idmiston is being erected on a site adjacent to the main road. The building, which is estimated to cost £560 in addition to the £40 for the site, will be 44ft. by 24ft., and will accommodate 135 persons. There will be a small vestry at the rear, and space will be left for eventually building Sunday schools. The building will be of red brick with stone dressings, with an open-timber hammer-beamed roof covered with slates. The style is Gothic of the Early English period. Messrs. Gordon & Gunton, of Blomfield Street, E.C., are the architects; and the builder is Mr. E. Witt, of Salisbury.

A New Public Hall at Bewdley is being erected in the rear of the George Hotel in Load Street. It will be a commodious building, the main room measuring 74ft. by 27ft. and, with the gallery, capable of seating about 500 persons. The entrance is large, and on each side of the doorway are cloakrooms. The roof is open-timbered, and will be stained and varnished, and stained-glass will be inserted in the windows. The platform will be a movable one, and the ante-room large and well arranged. The building will be heated by hot-water pipes and lighted with gas. Messrs. Nicholls & Co., Ltd., of Worcester, are the builders, and Mr. Cross, of Walsall, the architect.

QUERIES ANSWERED

RESPECTING

Our Insurance Schemes.

From time to time we have queries addressed to us by readers on points affecting our Accident Insurance Schemes. The greater number of the queries relate to the conditions of payment, and to enlighten those who may still be in doubt we think it desirable to state

(1.) That it is not necessary to subscribe direct to the office in order to secure the benefits.

(2.) That even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.

(3.) It is sufficient to have an intimation from the newsagent that he supplies copies regularly.

(4.) That policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.

(5.) In applying it is not necessary to write a long letter—a postcard will do, giving the full name and address of the newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the Ocean Accident and Guarantee Corporation, Ltd.

Scheme No. 1 is a free Accident Insurance of **£500.**
FREE.

(*Every regular reader of the Builders' Journal is entitled to this without any payment.*)

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, Premium, £3/-/-

Hazardous Risks, Premium, £3/10/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

If these schemes interest you, write for full particulars to

BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,
STRAND, W.C.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
		BUILDING:		
Sept.	6	Barking, Essex—Iron Building	Urban District Council	C. F. Dawson, Public Offices, Barking.
"	6	Bristol—Alterations	—	A. P. J. Cotterell, 28 Baldwin Street, Bristol.
"	6	Dewsbury—Conveniences, &c.	—	Holdom & Fox, Architects, Corporation Street, Dewsbury.
"	6	Great Yarmouth—House	—	S. Rivett, 5 Southquay, Great Yarmouth.
"	6	Old Penshaw, Durham—Houses	Mr. R. W. Wilson	R. W. Wilson, Westbourne House, Shiney Row.
"	6	Cardiff—Materials	Guardians	A. J. Harris, Queen's Chambers, Cardiff.
"	6	Ponkey, near Ruabon, Wales—Organ Chamber	—	Dover House, Chapel Street, Ponkey.
"	7	Preston—Alterations	—	F. E. Dixon, 49 Lune Street, Preston.
"	7	Great Harwood, Lancs—Schools	—	Rev. W. C. Rank, 141 Blackburn Road, Great Harwood.
"	7	Aber, Wales—Additions	—	A. O. Evans, Pontypridd.
"	7	Comber—Six Kitchen Houses	—	W. H. Wheeler, Architect and Surveyor, Castle Street, Comber.
"	7	Banbridge, Ireland—Schoolhouse, &c.	Select Vestry of Seapatrick Parish	T. Larmour, Dromore Street, Banbridge.
"	7	Edinburgh—Washhouses	Corporation	Public Works Office, City Chambers, Edinburgh.
"	7	Rugby—Public Slaughterhouses, &c.	District Council	D. G. Macdonald, Surveyor to the Council, Rugby.
"	9	London, E.—Bricks	Stepney Borough Council	Mr. W. Jamieson, 15 Great Alie Street, Whitechapel, E.
"	9	War Department Contracts (Aldershot)—Repairs and Materials.	—	Sub-District Commanding Engineer, South Aldershot, R.E. Office.
"	9	Aberdare—Swimming Baths	Urban District Council	Surveyor, Town Hall, Aberdare.
"	9	Cwmavon, Wales—Vestries	—	G. E. Prosser, Cwmavon.
"	9	Griffithstown, near Pontypool—	Panteg Urban District Council	Surveyor's Office, Sunny Bank, Griffithstown.
"	9	Manchester—Walls, &c.	Corporation	City Surveyor, Town Hall, Manchester.
"	9	St. Albans—Lavatory Buildings	Herts County Council	County Surveyor's Office, 41 Parliament Street, Westminster, S.W.
"	9	Southborough, Kent—Chapel, &c.	Urban District Council	W. Harmer, 137 London Road, Southborough.
"	9	Sedgefield—Stores and Office Block	Visiting Committee of Durham Asylum	W. Crozier, County Surveyor, Shire Hall, Durham.
"	9	Braintree—Alterations, &c., at Workhouse	Union Guardians	F. Smoothy, Clerk, New Street, Braintree.
"	10	Wimbledon—Floor	Urban District Council	R. J. Thomson, 47 Hill Road, Wimbledon.
"	10	Ulverston—Bridge Improvements	Main Roads and Bridges Committee	County Bridgemaster's Office, Preston.
"	10	Oxcliffe Marsh, Lancs—Arch	Main Roads and Bridges Committee	County Bridgemaster's Office, Preston.
"	10	Lincoln—Abattoirs	Markets Committee	R. A. Macbrair, City Surveyor, Corporation Offices, Lincoln.
"	10	Kidwelly, Ireland—Coastguard Station	—	A. Ferguson, Insurance Buildings, Donegal Square West, Belfast.
"	10	Bristol—Stable	Great Western Railway Company	Engineer's Office, Bristol Station.
"	10	Wolverton—Caretaker's House	Parish Council	S. Jones, 100 Cambridge Street, Wolverton.
"	10	Northrepps, near Cromer—Classrooms	School Board	J. T. Willis, 25 Cabbell Road, Cromer.
"	11	Hackney—Works at the Brentwood Schools	Guardians	W. A. Finch, 76 Finsbury Pavement, E.C.
"	12	Andover—Bridge	Rural District Council	J. Wormald, The South Cottage, Andover.
"	12	Brighton—Artizans' Dwellings	Town Council	F. J. C. May, Town Hall, Brighton.
"	12	Langho, near Blackburn—Homes	Lancs Inebriate Acts Board	H. Littler, County Architect, County Offices, Preston.
"	12	London, S.E.—Cottage and Shed	Lewisham Borough Council	Surveyor, Town Hall, Catford.
"	13	Llanedy, Carmarthen—School	School Board	J. Davies & Son, Cowell House, Llanelly.
"	14	Flookburgh, Lancs—Rebuilding	Miss Seath	Field Head Farm, Flookburgh.
"	14	Patterdale, Westmoreland—Police Station	—	J. Bintley, 7 Lowther Street, Kendal.
"	16	London, W.—Mortuary Buildings and Chapel	Paddington Borough Council	Surveyor, Town Hall, Paddington, W.
"	16	Mansfield—Schools	School Board	Vallance & Westwick, Mansfield.
"	16	Birmingham—Cottages, &c.	Guardians	Whitwell & Sons, 23 Temple Row, Birmingham.
		ENGINEERING:		
Sept.	7	Tralee, co. Kerry—Rebuilding Bridge	County Surveyor	S. Goodwin, County Surveyor, Tralee, co. Kerry.
"	7	Southend-on-Sea—Electric Lighting Cables	Corporation	D. F. Adamson, Corporation Electricity Works, Southend-on-Sea.
"	7	Usworth, Durham—Lamps, &c.	Parish Council	J. R. Elliott, Fern House, New Washington, co. Durham.
"	9	Penmaenmawr, Wales—Sea Wall	Urban District Council	E. Worrall, Engineer, Council Offices, Penmaenmawr.
"	9	Rawmarsh, Yorks—Repairs to Mains, &c.	Urban District Council	Surveyor, Council Offices, Rawmarsh.
"	9	Swinton, Lancs—Bacteria Filters	Urban District Council	H. Entwisle, Surveyor to the Council, Council Offices, Swinton.
"	9	Swansea—Road Roller	Corporation	Borough Surveyor, Swansea.
"	9	Edinburgh—Electric Light Installation	—	Resident Electrical Engineer, Electricity Supply Station, Dewar Place, Edinburgh.
"	9	Lowestoft—Electric Lighting Plant	Mayor and Corporation	R. B. Nicholson, 115 High Street, Lowestoft.
"	9	Cowes, Isle of Wight—Pumping Machinery	Urban District Council	J. W. Webster, Engineer to the Council, Cowes, I.W.
"	9	Beaminster, Dorset—Adit	Rural District Council	H. Gordon, 9 Downes Street, Bridport, Dorset.
"	10	Oldham—Electric Cranes	Corporation Electricity Committee	A. Andrew, Gas and Water Offices, Oldham.
"	10	Rawtenstall, Lancs—Rebuilding Bridge	Main Roads and Bridges Committee	County Bridgemaster's Office, Preston.
"	10	Briton Ferry and Quaker's Yard, Glamorgan—Reconstructing Bridges.	Great Western Railway Co.	Engineer, Neath Station.
"	11	Godstone, Surrey—Sewerage, &c., Works	Rural District Council	T. C. Barralet, Surveyor to the Council, New Oxted.
"	13	Kirkcaldy, Scotland—Overhead Construction for Electric Tramways.	Corporation	W. L. Macindoe, Town Clerk, Kirkcaldy.
"	13	Torquay—Arc Lamp Carbons	Electric Lighting Committee	P. Storey, Borough Electrical Engineer, Electricity Works, Torquay.
"	14	Shrewsbury—Heating	—	Churchwardens, Abbey Church, Shrewsbury.
"	14	Warrington—Electric Lighting, &c.	Corporation	J. Deas, Engineer, Bank House, Warrington.
"	14	Dundee—Overhead Equipment	Town Council	W. J. Tittensor, City Electrical Engr., Dudhope Cres. Rd., Dundee.
"	14	Batley—Permanent Way	Corporation	Lacey, Clirehurst & Sillar, 2 Queen Anne's Gate, Westminster, S.W.
"	14	Llandudno—Waterworks	Urban District Council	E. P. Stephenson, Engineer & Surveyor to the Council, Llandudno.
		IRON AND STEEL:		
Sept.	6	Valetta, Malta—Pipes, &c.	—	Superintendent of Public Works in Malta.
"	9	Aberdare—Railings	Urban District Council	Surveyor, Town Hall, Aberdare.
"	10	Barking, Essex—Wrought-iron Railings	Urban District Council	C. F. Dawson, Public Offices, Barking.
"	11	Gosport—Railing	Urban District Council	H. Frost, Surveyor, Town Hall, Gosport.
"	11	Downpatrick—Ironmongery, &c.	District Lunatic Asylum	S. Rea, Clerk, Downpatrick.
"	11	London, E.C.—Ironmongery	Guardians of the Holborn Union	J. A. Battersbury, Clerk, Clerkenwell Road, E.C.
"	14	Glasgow—Pipes	Corporation	J. M. Gale, 45 John Street, Glasgow.
"	17	Bournemouth—Steel Rails, &c.	Town Council	F. W. Lacey, Borough Engineer, Municipal Offices, Bournemouth.
"	18	Netherlands—Asphalted Cast Iron Pipes, Railway Carriages, &c.	Ministry for the Colonies	Commercial Department, Foreign Office, S.W.
"	20	London, W.C.—Rails, &c.	British Electric Traction Co., Ltd.	Chief Engineer of the Co., Donington House, Norfolk St., Lon., W.C.
		PAINTING AND PLUMBING:		
Sept.	7	Hunwick—Painting Primitive Methodist Chapel	—	T. Craddock, Hunwick, Willington.
"	9	Jarrow—Repairing, &c. Lamps	Urban Sanitary Authority	Borough Surveyor's Office, Grange Road, Jarrow.
"	11	Cannock, Staffs—Painting, &c.	Guardians	A. W. Carver, Clerk, Union Offices, Cannock.
		ROADS AND CARTAGE:		
Sept.	6	Shrewsbury—Steam Roller, &c.	Atcham Rural District Council	J. Everest, St. John's Hill, Shrewsbury.
"	9	Epping, Essex—Carting	Urban District Council	G. J. Creed, Epping, Essex.
"	9	Romford—Granite Spalls	Guardians of Union	W. Smith, 24 North Street, Romford.
"	9	London, E.—Vans	Stepney Borough Council	M. W. Jamieson, 15 Great Alie Street, Whitechapel, E.
"	9	Nottingham—Forming, &c.	Guardians	A. Marshall, Architect, King Street, Nottingham.
"	9	Ryton-on-Tyne—Cartage	Urban District Council	J. P. Dalton, Surveyor, Ryton-on-Tyne.
"	9	Sunderland—Road, &c.	Corporation	Borough Engineer's Office, Town Hall, Sunderland.
"	9	Swinton, Lancs—Street Works	Urban District Council	H. Entwisle, Surveyor of the Council, Council Offices, Swinton.
"	9	Waterhead, Oldham—Paving and Flagging	Lancs County Council	J. Slater, 2 The Polygon, Eccles, near Manchester.
"	9	Brentwood, Essex—Roads	—	E. Millard, Surveyor, 1 Finsbury Circus, E.C.
"	10	Barking, Essex—Street Works	Urban District Council	C. F. Dawson, Surveyor, Public Offices, Barking.
"	10	Blackwell—Making-up Streets	Rural District Council	H. Silcock, 31b West Gate, Mansfield.
"	10	Christchurch, Hants—Quartzite	—	E. J. Legg, Borough Surveyor, Town Hall, Christchurch.
"	10	Cork—Ballast, &c.	Harbour Commissioners	J. Price, Commissioners' Engineer, Cork.

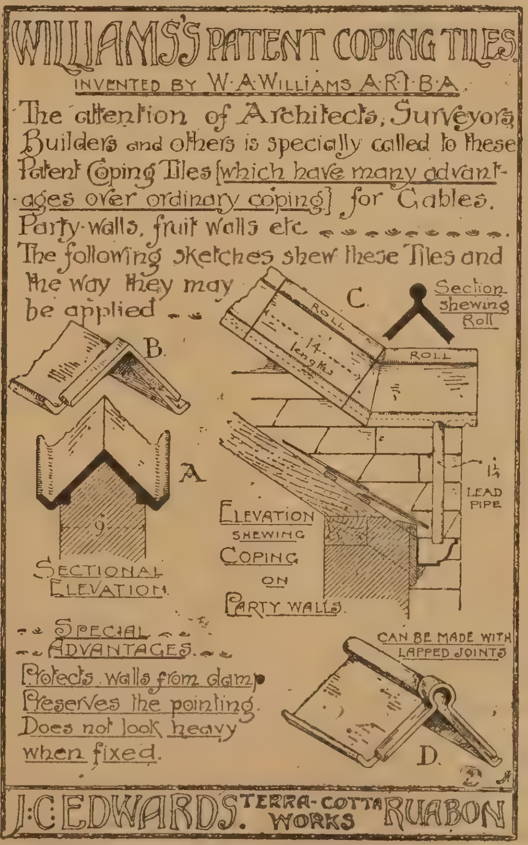
IMPROVED COPING TILE
(*PATENTED*)
For GABLES, PARTY WALLS, &c.



WILLIAMS'S PATENT COPING TILES.
INVENTED BY W·A·WILLIAMS A·R·I·B·A.
The attention of Architects, Surveyors, Builders and others is specially called to these Patent Coping Tiles [which have many advantages over ordinary coping] for Gables, Party-walls, fruit walls etc.
The following sketches shew these Tiles and the way they may be applied
A.
B.
C.
D.
ROLL
ROLL
14 lengths
Section shewing Roll
1¼ LEAD PIPE
9
SECTIONAL ELEVATION.
ELEVATION SHEWING COPING ON PARTY WALLS.
SPECIAL ADVANTAGES.
Protects walls from damp.
Preserves the pointing.
Does not look heavy when fixed.
CAN BE MADE WITH LAPPED JOINTS
J. C. EDWARDS. TERRA-COTTA WORKS RUABON

This Coping prevents the water collected by it from running down and soaking into the wall beneath.

The end tile is provided with outlets, from which the water can be conducted to the eaves gutter or elsewhere by a small lead pipe, or the outlet holes can be omitted, the tile throated and set to let the water shoot clear of the building, but the pipe is recommended and the expense is trifling.

It can be used as well on the flat, as raking, for with a little care it can always be laid to a slight fall, the outlets then should not be more than 10 feet apart.

The Tiles are set and jointed in cement, the edges being scratched up rough to form a key, making a permanent and water-tight joint.

It will be seen that with these Copings the walls are protected from dampness, pointing preserved, rooms in roof kept dry, and defective flashings and fillets do not cause so much leakage. No other ordinary Coping answers the same purpose.

COMING EVENTS.

Wednesday, September 4.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. E. J. Steegmann, M.B., on "Natural Forces: Light, Heat, Electricity, Chemistry," 7 p.m.

IRON AND STEEL INSTITUTE.—Autumn Meeting at Glasgow (Second day).

Thursday, September 5.

IRON AND STEEL INSTITUTE.—Autumn Meeting at Glasgow (Third day).

Friday, September 6.

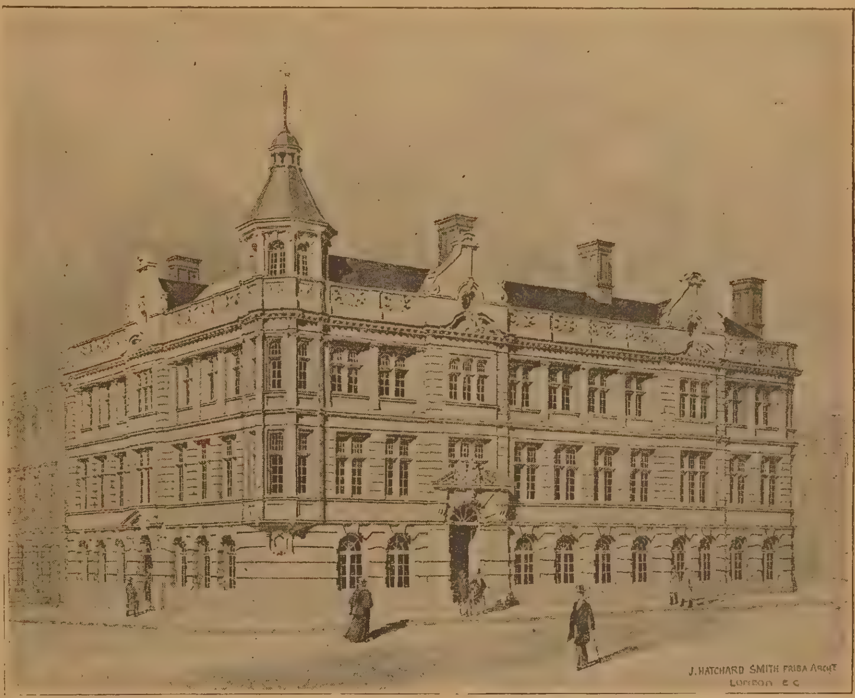
An Architectural Causerie.

The Noble Art of Self-Defence. SINCE it was announced that the new public offices in Whitehall were to be carried out by the Government officials, the First Commissioner of Works and his Department have been the objects of such lively criticism that they evidently thought it was high time to publicly defend themselves; hence the article reprinted on page 66. Because the Record Office in Chancery Lane is—from an official point of view—one of the most beautiful buildings in London, and because the General Post Office North and the Admiralty are—from an official point of view—almost without a flaw, it does not necessarily follow that they are equally satisfactory to those who are not of the official genus; and be it remembered that no man buildeth for himself. As regards the suggestion of employing an outside architect of standing to complete the work, this was abandoned because he would be too individualistic and too busy, so that "a man in the second or third rank of his profession" would have had to be chosen. Yet on the authority of Mr. Leonard Stokes, one of the late Mr. Brydon's executors, we know that the drawings handed over to the Office of Works were but "incomplete drawings for the carcase of the building." Somebody will need to prepare the details, and we do not see that they will be less individualistic when done by Sir John Taylor and Mr. Henry Tanner than if the work were in the hands of one of those eminent outside architects who are "deeply committed to their own ideas of art": and individualism is of many kinds. In conclusion we would draw attention to the fact that, while Mr. Akers-Douglas distinctly stated that he hoped to effect "a considerable saving," the inspired writer of the article in question informs us that "financially it is highly improbable that any saving will be effected," which information we leave our readers to cogitate when pondering over the treatment of official architecture in this country.

The Earliest of Art. THE subject of art is so complex that it is not surprising to find no general conviction concerning its origin and its practice. "Art and Nature," says one writer, "are the two most comprehensive genera of which the human mind has formed the conception." This is the broad statement; as a transcendental one John Stuart Mill says that Art is as much Nature as anything else; that everything which is artificial is natural; and that Art has no independent powers of its own, being but the employment of the powers of Nature for an end. Other opinions, as diverse as they are unconvincing, could be cited, but it will suffice for the present to note the most recent which has attracted attention—that of Mr. Yrjö Hirn, who holds the opinion that Art is the outcome of "the natural tendency of every feeling-state to manifest itself externally, the effect of such manifestation being to heighten the pleasure and relieve the pain." From the foregoing it will doubtless be appreciated that the subject, considered from a fundamental standpoint, is likely to lead to innumerable opinions which, however ingenious, make us none the wiser. These several remarks, however, have some bearing on what follows. The study of the rise or development of art (architecture being a part) furnishes much more satisfactory results than an abstruse enquiry into its origin, for there are at least some tangible visible proofs. Vitruvius tells us that primitive man began to imitate the nests of birds and lairs of beasts, and constructed arbours with twigs of trees, after which came walls of dried turf strengthened with reeds and branches, the further progress from huts to houses being easy and gradual. This was most strikingly illustrated by Professor Flinders Petrie in his lecture on the sources and growth of Egyptian architecture (see our issue for May 22nd last). It is generally admitted that the cave, the hut or tent, and the house are the correct sequence in which man provided himself a shelter. With such a prologue we may now refer to a letter by Mr. Auberon Herbert which appeared in the "Times" last week. It is headed "A New Record of Totemism," a title which in these days might be calculated to assure its not being read by one in a thousand: and yet it is of much interest. Professor Petrie in the lecture to which we have referred astonished his hearers by speaking of the art that flourished in Egypt nearly eight thousand years ago. Mr. Herbert's letter carries us back at least eighty thousand years. That was the end of the Glacial period, which, according to Geikie, had lasted 160,000 years. It was then and thereabouts that the Old-stone-cutters or Palæolithic men thrived, men who had "real artistic power" and who traced the outlines of animals on fragments of deer's horn or pieces of schist with a strong clear touch. After them came the New-stone-men, who showed greater advance in the arts of life, making pottery and ornamenting it. Now the gist of Mr. Herbert's letter is this—the great bed of gravel which extends between the mouth of the Avon and Milford (near Lymington) practically consists of *worked* flints, a mass of *worked* stones. Some, he says, may be holy stones, or cup stones, or simply cut for the purposes of decoration. Amazingly delicate work is found on some of them. One appears to represent a pyramid, another a snake, another a fish, another a mountain peak, or a flame, or a beast or bird, or a "low-domed roof with ridges, hollow in the inside": but it is easy to conjure up fanciful resemblances, and the only safe guide is the repetition of the same type. Mr. Herbert says the workers must have been impressionists (how history repeats itself !). They caught some special feature and neglected the other features. They were not constrained by any sense of exactness. If they put in an eye on one side of what may be meant for a bird's head they might put in the other eye somewhere on the other side—it did not matter where; or perhaps they put both eyes in together on the same side, as a child does in drawing a profile, from the conscientious feeling that what is there ought somehow to be expressed. We will not go into further detail, but from what has already been said it will be seen that these early efforts towards Art are of considerable interest. Mr. Herbert hopes other persons will examine gravel beds. The floor of a gravel pit, a heap of gravel by the roadside, the margin of the road itself where the wheels do not pass, a friend's gravel path if not rolled down, or in some cases the bed of a stream or an estuary, will give a fair insight into the matter. The more specimens the more light will be thrown on the subject.



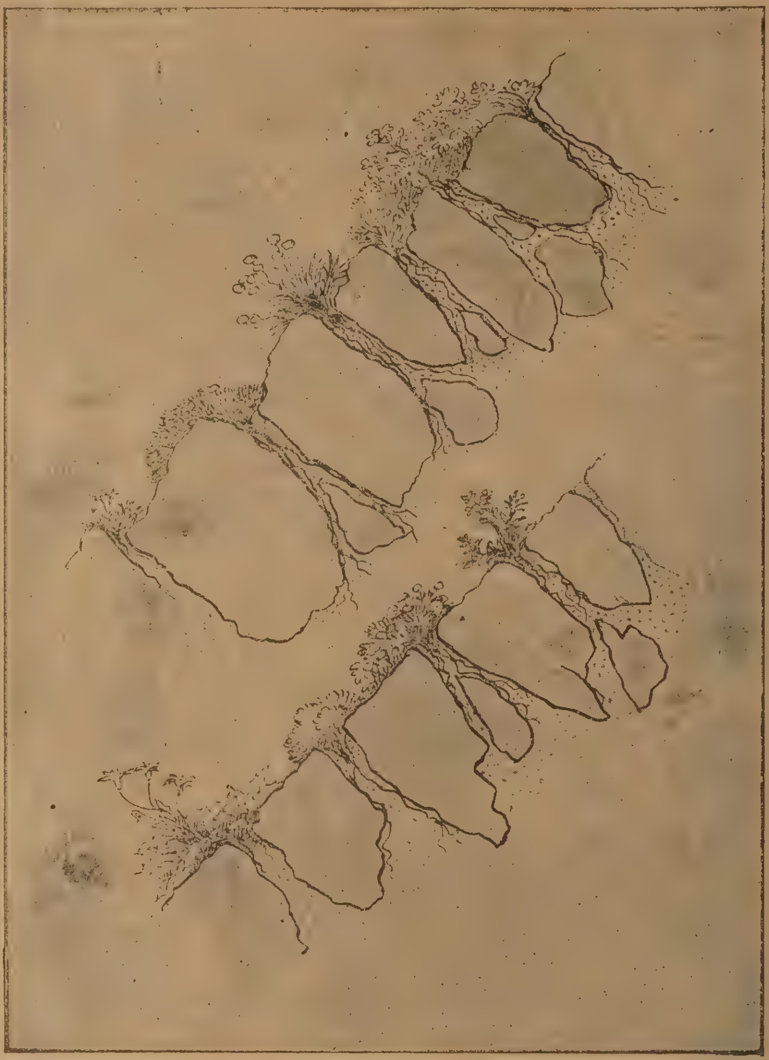
J. HATCHARD SMITH FRIBA ARCHT
LONDON E C

STATION STREET BUILDINGS, HUDDERSFIELD; FOR MESSRS. ARMITAGE & NORTON.

Station Street Buildings, Huddersfield. THESE buildings, illustrated on this page, are now being erected in a prominent position in Huddersfield. The elevations are faced with York stone, and all floors will be fireproof. Messrs. Abbey & Hanson, surveyors, of Huddersfield, prepared the working drawings and generally superintended the work. The buildings are being erected by Mr. M. Brook, of Huddersfield, from the design of Mr. J. Hatchard Smith, F.R.I.B.A., of 41, Moorgate Station Buildings, who periodically visits the work in progress.

GARDENS.

AN interesting and useful book on "Wall and Water Gardens," by Miss Gertrude Jekyll, has recently been published by Messrs. George Newnes, Ltd., of 7–12, Southampton Street, Covent Garden, W.C. (price 12s. 6d. nett); and while reviewing the book it seems opportune to make some remarks upon gardens in general and their design. Miss Jekyll has written much upon the subject of gardening, and in this latest work she has produced a most valuable contribution to garden literature. She writes pleasantly and clearly, with evident keen enthusiasm, and although she takes care to only lay claim to write for amateurs, as one of their number, we feel that she is more to be depended upon than the majority of gardeners or landscape-architects. In fact, we could not recommend a better guide for the beginner to follow, her taste being almost invariably correct. However, even here it is advisable for the student to have some method and general principles to work upon in order that Miss Jekyll's knowledge may be used to the best advantage in the quickest way, by getting to the pith of the matter and avoiding those bypaths in gardening which are to be found in the book. Miss Jekyll's plea that the walls of gardens and places where no hygienic considerations obtain should be constructed in rough dry-walling is a timely one. Most retaining and boundary walls built nowadays are only too uselessly barren. How interesting and beautiful they can become when the careful hand of Nature has placed plants in the crevices can be seen in any old building and in the boundary walls of country lanes. These rough walls, built of stone without mortar, offer a most satisfactory method of treatment in the construction of terraces on a hillside garden. In almost every locality stone can be easily obtained which will be suitable for this kind of walling, though not perhaps for building dwellings, &c.; or, if stone is unobtainable, chalk can be used.



SECTIONAL DIAGRAM SHOWING ALTERNATIVE ARRANGEMENT OF THE FACE OF THE STONES IN A ROCK-WALL AT AN ANGLE OF 45 DEGS.

A GARDEN TANK WITH FLAT KERB.

We may quote Miss Jekyll upon the treatment of garden terracing. "It is well in sharply-sloping ground to keep the paths as nearly level as may be, whether they are in straight lines or whether they curve in following the natural contour of the ground. Many more beautiful garden-pictures may be made by variety in planting even quite straightly terraced spaces than at first appears possible, and the frequent flights of steps, always beautiful if easy and well proportioned, will be of the greatest value. When steps are built in this kind of rough terracing the almost invariable fault is that they are made too steep and too narrow in the tread. It is a good rule to make the steps so easy that one can run up and down them, whether of skilled workmanship (as in the illustration on p. 65 of this issue) or rough. There is no reason or excuse for the steep, ugly, and even dangerous steps one so often sees. Unless the paths come too close together on the upper and lower terraces, space for the more easy gradient can be cut away above, and the steps can also be carried out free below; the ground cut through above being supported by dry-walling at the sides of the steps, and where the steps stand up clear below, their sides built up free. If for any reason this is difficult or inexpedient, a landing can be built out and the steps carried down sideways instead of up and down the face of the hill. In fact, there is no end to the pretty and interesting ways of using such walling and such groups of steps." These steps and walling in time become a garden of delightful small things. "I doubt if there is any way in which a good quantity of plants and of bushes of moderate size can be so well seen and enjoyed as in one of these roughly-terraced gardens, for one sees them up and down and in all sorts of ways, and one has a chance of seeing many lovely flowers clear against the sky, and of perhaps catching some sweetly-scented tiny thing like *Dianthus fragrans* at exactly nose-height and eye-level, and so of enjoying its tender beauty and powerful fragrance in a way that had never before been found possible." The disfiguring steep banks of mown grass generally seen on sloping ground are abominations compared with these delightful wall gardens; they are also troublesome to mow, and waste spaces that might be made of interest. In the author's words: "Not only does the wall afford the shelter needed for plants that would otherwise be scarcely hardy, but the effect of planting them with the roots spread horizontally, and the crown of the plant therefore more or less upright instead of flat, obviates the danger that besets so many tender plants, of an accumulation of wet settling in the crown, then freezing and causing the plant to decay."

A FINE HOUSE WITH UNBROKEN LAWN SPACE AND QUIET WATER-EDGE.

In constructing a dry wall it is best to set the stones more or less in courses or in lines of stratification, as we find them in a stone quarry or on any uncovered mountain side. The courses can run level or dip to right or left as they generally do in nature, but the same order must be kept throughout. "It matters not the least whether the courses are far apart or near together," says Miss Jekyll; "this is naturally settled by the steepness of the ground. In a wall they are necessarily close, and in very steep ground it is convenient to build them with the courses rather near each other. In such a case as a steep slope with an angle of 45 degrees, the face of the rock-bank could be built in either of the two ways shown in the diagram (see opposite page). Both will suit the plants. The flatter the angle of the ground the further apart may be the rocky courses, as the danger of the earth washing away is diminished. . . . But whether a stone lies level or not as to the right and left of its front face, it should always be laid so that its back end tips down into the ground, and its front face, when seen in profile, looks a little upward. This, it will be seen, carries the rain into the ground instead of shooting it off as it would do if it were laid the other way, like the tile or slate on a building." In fact, the whole face of the wall should lean back so as not to lose a drop of rain. Any loose earth at the back must be closely rammed to prevent the danger of the wall being burst outward under heavy rain. Whenever any newly-moved earth behind the wall is noticed it should be at once rammed and made firm in the same way. The spaces left at some of the joints and between the course are for planting, which is best done as the wall goes up, when the roots can be laid well out and larger plants used than if they were to be put in the wall when up.

A most useful suggestion is that the steps which go with the walling need not be entirely paved with stones; if the front edge is carefully fitted and fixed the rest can be levelled up with earth and the sides and angles planted with small growths. Miss Jekyll is somewhat too fond, however, of planting small growths in steps, and we would advise that these should be left to take care of themselves, for artificial planting can be easily overdone and soon becomes noticeable on steps which are generally associated with orderliness, a necessity to their usefulness; if they are overgrown they show that little use is made of them, and no planting can so fittingly suggest this idea as Nature's. Miss Jekyll has no doubt been biased in this by her enthusiasm for living growths, for she even commends such an atrocious anomaly as the flight of steps illustrated on p. 64, and goes so far as to say: "But the presence of such plants gives a keen delight to the flower lover, even though his sympathies with architecture may tell him that for plants to be in such a place is technically wrong." It may be, however, that the author is out of sympathy with this particular design, as she well might be; it is too cold and hard for country domestic work, its Georgian austerity being too stiff and unbending, with a Classic inutility which has no adequate excuse. The concealment of architectural features by climbing growths is also another thing in which the gardener generally errs, and we notice several cases where Miss Jekyll is caught tripping in this respect; this is doubtless caused by the nausea and animosity created in the mind of the Nature-lover by the great amount of bad architectural design to be seen everywhere around us, and a really suitable and fine piece of work is seldom so badly treated as the inferior examples are. This, however, is but another instance of the fact that only an architect is capable of judging architectural values.

It is to be hoped that the public will come to recognise in the near future that shams and makeshifts are not really cheap, and will realise that the logical course is to have that which will last, and not that which is most easily obtained in an inflated market. As an example, we may refer to that cheap and useful abomination, wire-netting. Before this came to desecrate the face of the earth, walls were built where something more permanent than a wooden fence was required, and these remain as a lasting source of delight to all cultured persons. Broken by piers of masonry, with wrought-iron gates of good design, they seem the only appropriate enclosure.

We would now make a few remarks on the ethics of garden treatment in general. Whenever man interferes with Nature he launches himself on a troublous sea—then he finds himself but a puny individual and must use her correctly in her own way, or inevitably fail. Art which deals with inanimate objects has perhaps greater knowledge of the medium in which it expresses itself, but on the other hand the Art which uses animate objects has immense aids, for it need have no concern with constructive work on its materials, having only to use or phrase them on a large scale, all the details being filled in by the finer hand of Nature, transforming crudities into beauties which are harmonic and absolute. This harmony of Nature arises from many causes. The wind sweeping across some open space or through the forest dominantly and irresistably plys the vegetation into one great chord; the particular soil of the locality impresses on the growth; the climate gives another distinctive quality; the neighbouring shelter gives another—in fact, the environment harmonises everything. What man, we would ask, can expect to take adequate cognisance of these actions and use them? To build for utility is the only safety. No one could design with fore-knowledge of the appearance of the old Kentish castellated house illustrated on p. 66. One seems to feel it as part of the wind-blown open-land, the waving flags and water-lilies in the moat and the hardy clinging ivy on its walls all adding to the effect. To show man's cleverness here would be a desecration. We may also refer to the old bridge illustrated which has so fallen into the landscape that to remove it would create an immense void. Such an association of course only comes in course of time.

Locality should influence a garden much, and a harsh note is at once struck when a foreign element is introduced, such as by the introduction of plants that do not belong to the general soil, or by the artificialities of the usual landscape-gardener with his rustic rocky pools, with sunk tubs, &c. Native plants should find more place, for they are the most natural. Modern gardening seems too much in the nature of an exhibition of samples.

One of the best characteristics of Miss Jekyll's book is the reason she advances for everything she does or advises, such as in the soils that suit certain kinds of plants, &c., and she seems to feel throughout what is the natural method of treatment in every case, and writes agreeably on such subjects as stream gardens, lakes, large and small ponds, pools and tanks; but she should not have recommended the making of imitation rock gardens where they form no part of a formal scheme. It is somewhat a pity that she did not place the remarks upon formal gardens more to the front of the book, for it is here that legitimate garden design really lies. The treatment of these is based on showing human contrivance throughout, and by this very fact they seem homely and human, although we agree with the author that the large gardens of grandiloquent design are cold and do not give that contentment to be found in a lovingly-cared-for garden. As she says, large gardens are "only redeemed when some master-mind, accepting the conditions of the place as they are, decides on treating it in some bold way, either in one grand scheme of colour-harmony or as an exposition of this principle combined with the display of magnificent foliage-masses, or by some other such means as may raise it above the usual dull dead-level." The following should be taken to heart—it is a subject we have said much upon of late: "I always suppose that these great wide dull gardens, sprawling over much too large a space, are merely an outgrowth of plan-drawing. The designer sitting over his sheet of paper has it within such easy view on the small scale, and though he lays out the ground in correct proportion with the block-plan of the house, and is therefore right on paper, yet no human eye can ever see it from that point of view; and as for its use in promoting any kind of happiness, it can only be classed among others of those comfortless considerations that perplex and worry the mind with the feeling that they are too much and yet not enough."

The architect should, by rights, design both garden and house, for the two must correlate most intimately; yet the majority of the profession have either ignored the subject or lacked opportunity so that their judgment could not be relied upon, for the utmost refinement and feeling is required in every detail. An instance, not so bad as ordinarily, of the usual non-conformity is to be seen in the garden tank and house illustrated on p. 62. Here the simple old house seems to require a more simple balustrade than that in front of it, and the tank is too classic or austere with its curved ends. What is wanted is a simple square rough-walled tank, as utilitarian and neat as the house. This tank, however, is commendable in other respects, the broad flat kerb of wrought stone being in harmony both with the level lines of the water and the flat expanse of grass. The author says in this connection: "The proper relation of the water-level to the edge of the tank is a matter that is often overlooked. It should not be far from the level of the lower inside line of the kerb. Nothing, except an empty tank or fountain basin, has a much more unsatisfactory appearance than a deep tank with only a little water at the bottom. They are often built quite needlessly deep. . . . . Many people will no doubt put forward an objection to the unprotected edge on account of danger to children. But even a flat-edged tank need not and should not be dangerous. In the first place, there is no need for any tank to be more than two feet deep, while its under-water margin need not be more than one foot deep. It is much better that this should be in two distinct steps, the outer and shallower part being two, three, or more feet wide according to the size of pool. This would also help to keep the water-plants in their place, as in a dressed tank it looks better that whatever is grown in it should be kept away from the edge, and be surrounded by a distinct margin of water." A striking instance of how plants can be used architecturally is afforded by an illustration in the book, in the emphasis and breaking of the monotony of a long line of balustrade caused by growths partly veiling its continuity.

There is a useful chapter entitled "When to let well alone" which might be elaborated with advantage. Reference is here made to the illustration of the noble house in South Middle England (see p. 63): "The picture is complete. The great building is reflected in the still water, and the natural water margin without artificial planting, is wisely left alone. It is all so solemn, so dignified, that any added fussiness of small detail, however beautiful in itself, would be a kind of desecration."

The book is copiously illustrated with admirably reproduced photographs, and these very materially aid the letterpress. The book contains a list of flowers, &c., and much other matter to which we have not space to allude. It should be bought by every garden-planner and every garden-lover.

LLANFAIRFECHAN PUBLIC HALL.

A NEW public hall at Llanfairfechan has just been erected. The building contains on the ground floor two shops, between them being the main entrance to the hall, which is 89ft. extreme length and 50ft. wide inside. At the end is a stage, behind which is a passage communicating with two suites of retiring-rooms. At the side is another entrance door, which provides an approach to the first floor, which contains a room intended for use as a council chamber and three other offices. The masonry, slating and plastering were undertaken and carried out by Mr. Erasmus Jones, Llanfairfechan; the joinery, glazing and painting by Messrs. R. & J. Williams, Upper Bangor; the heating and fire-extinguishing apparatus by Messrs. G. N. Haden & Sons, Birmingham; the ventilating by Messrs. J. Gibbs & Son, Liverpool; the lighting by Messrs. Vaughan & Brown, of London; the drop curtain by Messrs. J. T. Bull & Son, of London. Mr. Richard Davies, of Bangor, was the architect. The outlay on the building is £3,500, but the land and furniture will cost another £1,500.

NORTHAMPTON INSTITUTE CLASSES.

WE have received a copy of the "Announcements" for the session 1901–2 at the Northampton Institute, St. John's Street Road, Clerkenwell, E.C., which is one of the branches of the City Polytechnic. The excellent work done by this institution is too well known to need description. Its classes are multitudinous, and we shall now only speak of those which come within the scope of this journal. Mr. John Ashford, M.I.M.E., is the head of the mechanical engineering and metal trades department, being assisted by Mr. Hugh Davies, F.G.S., A.M.I.M.E., and Mr. J. M. Lester, A.M.I.M.E.; while Mr. John Williams is the head of the artistic crafts department. Among the classes conducted by them are those dealing with graphics, building materials, workshop drawing, building calculations, construction, design and decoration, architectural drawing, and structural engineering. Mr. R. Griffith is the instructor in carpentry and joinery, Mr. W. Firth in practical plumbing, Mr. E. L. Bates in practical brick-cutting, Mr. T. J. White in practical plastering, Mr. C. L. Hartwell in modelling, Mr. H. E. Warren in woodcarving and Mr. A. J. Ireland in painting and decorating. A special course of six lectures, commencing on September 25th, will be given for bricklayers, brick-cutters, stonemasons, &c. (fee 1s.); a special course of seven lectures, commencing on November 6th, for woodworkers (fee 1s. 6d.); a special course of six lectures on sanitation, commencing on January 8th next, for plumbers, sanitary inspectors and others (fee 1s. 6d.); a special course of three lectures on ironwork in buildings, commencing on February 19th next (fee 1s.); a special course of three lectures on plasterers' work, commencing on March 12th next (fee 1s.); and a special course of five lectures on modern building practice, commencing April 9th next (fee 1s.). Special classes will also be held in design for decorative and ornamental ironwork, woodcarving, woodworking, painting and decorating, architectural ornament for builders, modelling for stone and wood carvers, and ornamental modelling for plasterers. The winter term begins on Monday, September 30th. Full particulars can be obtained by applying to Mr. R. Mullineux Walmsley, D.Sc., Principal of the Institute.

CAMPANULA PYRAMIDALIS, ETC., IN THE JOINTS OF STONE STEPS.

SOLOMON'S "SEALED FOUNTAIN."

To be used for supplying Jerusalem with Water.

MANY people will be interested to learn from the correspondent of the "Times" that at last an actual beginning has been made to bring a supply of living water into Jerusalem. The remains of ancient aqueducts and reservoirs testify to the abundant provision which the Holy City had when it flourished as the metropolis of the Jewish State. But it has now long been dependent on the scanty and often polluted accumulations of rainwater from the terraces of different houses gathered in the rock-hewn cistern beneath them. There is already not only a dearth of water for household purposes, but the extensive building operations which form a chief source of employment to the artisans and labourers have had to be suspended, which has deprived thousands of employment.

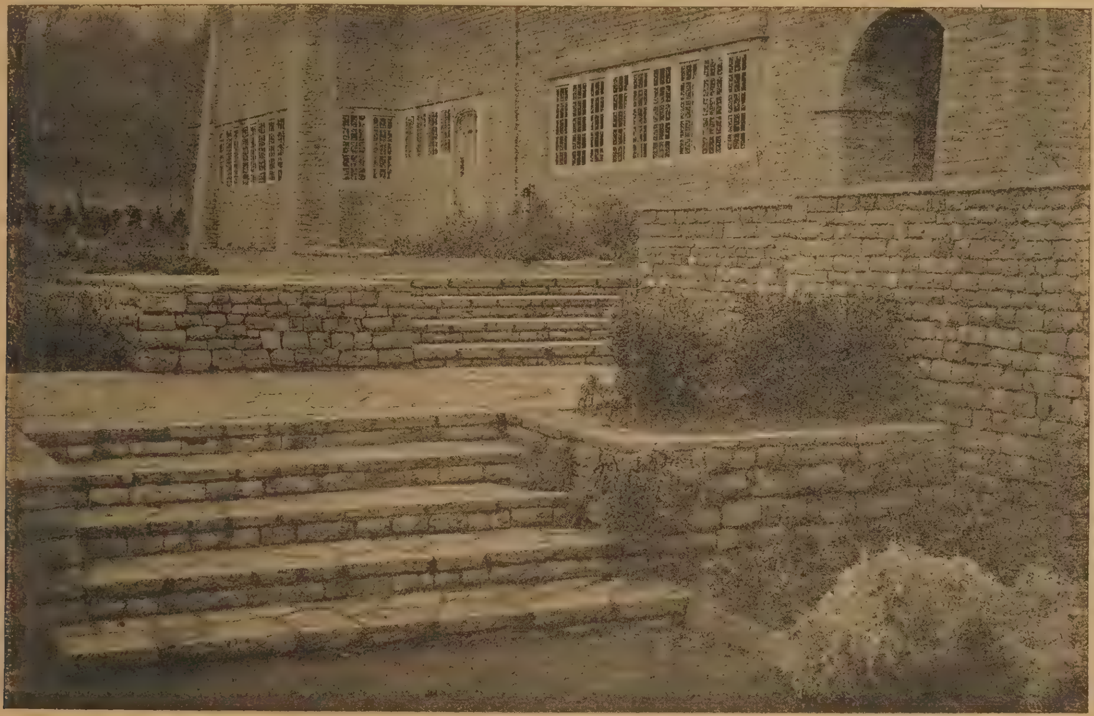
The work just begun is that of laying a pipe of 10c. diameter from the Sealed Fountain at Solomon's Pools (about nine miles south of the city) to Jerusalem. This fountain is supposed to be the work of Solomon and to be alluded to in the Song of Solomon in the words, "My beloved is like a spring shut up, a fountain sealed." It is a deep-down subterranean spring which has, from the time of Solomon, flowed through the arched tunnel built by him to the distributing chamber or reservoir near the north-west corner of the highest of Solomon's Pools. Half a century ago the location of this "hidden" spring, which was still, as in Solomon's time, flowing into the reservoir mentioned, was unknown. The tunnel is roofed by stones leaning against each other like an inverted V, the primitive form of the arch, which is also seen in the roof of the Queen's Chamber of the Great Pyramid. The entrance to this tunnel from the spring is one of the oldest structures in existence. The piping is to be laid along the old aqueduct which formerly, from the time of Solomon, brought this same water to the Temple area. It will require about 20,000 mètres of piping, and several English and Continental firms have been telegraphed to for offers to supply it. The course of the aqueduct is down the valley in which Solomon's Pools are built. Just below the lower pool the waters of Ain Etam join and augment the flow from the Sealed Fountain. At a little distance further down the valley the beautiful site of the ancient Gardens of Solomon, watered from these pools, is passed. The planting of these gardens, as well as the building of the pools of water, is mentioned by Solomon in the book of Ecclesiastes. Here now is Artas, a village in the still well-watered and fruitful valley. Here also has just been erected a Roman Catholic convent, built by a South American bishop at a cost of £15,000, where the nuns of the order of the Daughters of Solomon will conduct a school for Armenian Catholic orphans. Further on, the course of the aqueduct passes Bethlehem, and on northward past Tantour, where live the successors of the real order of the Knights of St. John, past Mar Elias, where Elijah is said to have rested in his flight from Jezebel; then it crosses the historic plain of Rephaim, where David, in the heat of the battle with the Philistines, longed for water from the well at Bethlehem; and finally, after passing around the slope of Zion, it enters the city through the grounds of the mosque of Omar, the old Temple area.

There are eleven or twelve ancient fountains here and there in the city, long unused but now to be utilised, and from which the water may be drawn free to all, several taps being attached to each fountain.

Another work of interest is the successful repairing of

The Virgin's Fount

in the Valley of Jehoshaphat, just outside the city walls. This is a fountain of brackish water with a small intermittent flow. That is to say, after several hours' flow there occurs a short interval during which the water ceases. It is the only fountain which Jerusalem possesses. Its waters pass to the Pool of Siloam through a tunnel on the wall of which was the oldest Hebrew inscription extant. A few years ago this inscription was surreptitiously cut out from its place and stolen, but was recovered by the Turkish authorities before it had been taken out of the country, and is now one of the most interesting objects in the Constantinople museum. About the same time efforts were made by blasting to increase the flow of water from the fountain, which resulted in a greatly diminished flow and in its ceasing altogether in the summer months. Some Siloam villagers undertook to restore the spring to its former effectiveness, for which they were to receive from the municipality 100 napoleons if successful. They found and closed the breaks through which the water was lost, and it is now flowing as formerly, to the great joy of the Siloam people, whose chief source of supply it was.



EASY STEPS IN CONNECTION WITH DRY-WALLING.

LOUGHBOROUGH'S MUNICIPAL OFFICES.

THE Corn Exchange at Loughborough now wears an entirely new aspect. A large stage has been added, and the old platform taken away. It has been fitted in the rear of what used to be the old hall, there being dressing-rooms at the back and store-rooms underneath. Another feature is that corridors of good width have been provided. Originally the only way out of the hall was through the front entrance and by means of the doorway which communicated with the town hall passage. Now there are seven exits. Accommodation has also been made for 120 more people, making the total accommodation something like 750. All the doors open outwards and are fitted with panic bolts, as is also the exit door in the town hall passage. The old council chamber will in future be used as a lecture hall.

On the north corridor, and on the land purchased from the bank, has been constructed the borough accountant's office, clerk's office, a cloak-room and lavatory, and a committee-room on the ground floor 36ft. by 16ft. At the back come the kitchen, scullery and pantry, fitted up to provide for a large number of people; in fact, it is estimated they will be able to cook for about 400 people.

In the west corridor lavatory accommodation is provided, and between the south corridor and the town hall passage are the new offices, which include the borough surveyor's private office, drawing office and clerks' offices. These are contiguous to the south hall, and have communication from the town hall passage to the south corridor. The borough surveyor's office is also the waterworks office. On the other side of the hall is the public rate office and private rate office. There is also another room allocated to the sanitary inspector. At the end of the south corridor is the artistes' entrance to the stage and the public staircase to the council chamber. Upstairs is the council chamber, mayor's parlour and councillors' retiring-room. There is a cloak-room and lavatory attached.

Reverting to the Corn Exchange, we might mention that the lighting and ventilation of the building has been thoroughly overhauled. The old chandeliers have been discarded and replaced by two brilliant sun-burners. There have also been about two dozen inlet ventilators put in, and the fresh air is drawn from the outside of the building and not from the corridors.

The whole of the works have been designed by Mr. A. H. Walker, A.M.I.C.E., borough surveyor, and it is anticipated the offices will be ready for opening in about a week's time, while it is hoped to get the whole of the buildings ready for October.

The premises are heated by low-pressure hot water by Messrs. Messenger & Co., and the contract has been executed by Mr. W. Moss & Sons, Ltd., the total cost being something like £6,000. Messrs. G. Gascoyne & Son, of Nottingham, were entrusted with the glazing.

The old town offices in Ashby Road have been let to the School Board, who in turn have sublet two rooms to the Guardians. The removal of the town offices to the new premises will also allow a slight extension to the Free Library, which is now about to occupy an extra room.

THE NEW PUBLIC OFFICES.

A Defence of the Government's Action.

A CORRESPONDENT to the "Times," in an article on the new public offices, says:—

No Minister in recent times has done more for the improvement of the Metropolis, for the good administration of his office, and for the gratification of the public than Mr. Akers-Douglas; yet, if Lord Wemyss is to be believed, no one is less qualified for the office he holds than the present First Commissioner of Works.

The President of the Academy led an attack upon the scheme, carefully considered as it had been by all the authorities concerned, for a great street improvement; and although that eminent critic did not summon up courage to attend and argue the point with Mr. Akers-Douglas when invited to do so, his polite description of the plan as "idiotic" was endorsed by many who, after hearing the First Commissioner's explanations, must have regretted their hasty acceptance of Sir Edward Poynter's views.

Now Lord Wemyss returns to the charge upon another controversial point, upon which the First Commissioner has had no opportunity of explaining the grounds of his action.

By an extraordinary fatality, the two eminent architects entrusted with the designs of the great public buildings in course of erection in Whitehall died within the space of a few months. Their designs had been completed and had been exhibited for the information of Parliament. They had met with very general approval, the contracts for the foundations had been accepted, and the work was in course of being carried out.

On the death of Mr. Young the First Commissioner decided to complete the work under the joint supervision of Mr. Clyde Young and Sir John Taylor. To this no objection was apparently taken.

On the death of Mr. Brydon a precisely similar question arose, and the First Commissioner decided that the work should be carried out by Mr. Henry Tanner, under the supervision of Sir John Taylor. It seems to be assumed that this decision was taken for financial reasons. This is not a fact. The main motive which actuated Mr. Akers-Douglas was regard for the comfort of the great body of public servants who will be called upon hereafter to occupy the building in question.

The chief concern of the public with both the new War Office and the buildings at the corner of Parliament Street is their outward form. This has been decided by the employment of the deceased architects, whose names will always be associated with the buildings in question. The internal arrangement of these offices is a matter of deep concern to the men who will have to spend long and arduous days within their walls.

In former times very little attention was paid to this not unimportant matter. The externally beautiful building which contains the Treasury is one of the most hopelessly unsatisfactory public offices which could be well imagined. Badly-designed rooms, incommodious passages, inferior ventilation and lighting, and waste of space comprise a conglomeration of every fault, from the point of view of the transaction of public business.

The building erected in Chancery Lane (one of the most beautiful in London) for the Record Office is internally perfect for the purpose for which it was designed by Sir John Taylor. The General Post Office North, designed by Mr. Henry Tanner, is as satisfactory a building for official purposes as could well be constructed. The Admiralty, for the internal planning of which the architects responsible for the building would readily admit their great debt of gratitude to Sir John Taylor, is—from an official point of view—almost without a fault.

It is not surprising that, with these experiences to guide him, Mr. Akers-Douglas should have hesitated to deprive himself of the services of those architects connected with his office whose knowledge of official requirements are unrivalled in the profession. Sir John Taylor's name stands high among living architects. It is true that Mr. Henry Tanner is less well known; but when Sir John Taylor was entrusted with the building of the Record Office he was not well known to the public, but the choice was amply justified. Time will in like manner justify the decision which Mr. Akers-Douglas has taken.

There is a further reason which weighed strongly with the First Commissioner. It has been too readily assumed that an eminent outside architect could be found to carry out Mr. Brydon's fine plan. Enquiries made with some care did not bear out this assumption. Eminent architects are men of strong individuality, deeply committed to their own ideas of art, imbued with their own notions of style, and, as a rule, absorbed by works of their own design, with very little time and less desire to bestow upon the work of others. It became speedily clear that, if an outside architect was to be employed, it would have to be a man of the second or third rank in his profession—assuming that the plan and elevation designed by Mr. Brydon were to remain unaltered. The First Commissioner not only considered that it was due to the memory of Mr. Brydon that his building should be erected according to his design, but he determined, for the sake of the intrinsic merit of the design itself, that this should be done.

These, then, were the reasons which actuated Mr. Akers-Douglas in recommending to his colleagues that the new building should be carried out under the superintendence of the architects of the Office of Works. Financially it is highly improbable that any saving will be effected. The design has been paid for, and the executors of the late Mr. Brydon have received the money. The remainder of the sum set aside for "commission" will be employed—as it would have been by Mr. Brydon had he lived—in remunerating the subordinates who have to carry out, from day to day, over five or six years, the work of variation and superintendence.

If, when the War Office and the great group of public offices at the corner of Parliament Street are erected, they prove worthy of their magnificent site, the credit will be due to Mr. Young and Mr. Brydon, who designed them; and if they prove satisfactory as official buildings, fulfilling the requirements and adding to the comfort of the public servants who will occupy them, the credit will be due to Mr. Akers-Douglas for bestowing his confidence upon two of his own officers who have not hitherto abused it.

A CASTLE MOAT WITH WILD FLAGS AND WATER-LILIES.

A New Town Hall and Assembly Rooms at Cheltenham are to be erected at a cost of £35,000 upon a portion of the Winter Garden site, on the north side of the glass structure.

ST. PETER'S HOSPITAL, BRISTOL.

THE new boardroom at St. Peter's Hospital, Bristol, is rapidly approaching completion. A little over one-third of the old premises was pulled down for the new buildings, but the quaint gabled front in Castle Street, which is of considerable archæological interest, has been saved. The contractors for the work are Messrs. Stephens & Bastow, and the architect is Mr. W. E. Skinner. In the basement of the new building, on a level with the main entrance passage, are three offices for the clerk to the guardians, vaccination officers, settlement clerks, &c., and the superintendent registrar's office has been enlarged. The new boardroom is on the first floor, on a level with the old room. It is built entirely of panelled Austrian oak. There is a large oblong-shaped sunlight in the roof, and this is painted white. At the top end of the apartment is a raised daïs for the chairman, and the front of this is also in panelled oak. The room is more than double the size of the old room. It contains 65,000 cubic feet. The new premises also include ladies' and gentlemen's cloakrooms, a chairman's retiring-room, and on the top floor apartments for the use of the caretakers, &c. The estimated cost of the work is £2,196, and this is exclusive of the furniture.

Before the old boardroom passes into disuse, so far as its present purpose is concerned, it may not be uninteresting to say a word about its historic features. The room itself is made of panelled oak, and is at least 600 years old. There are a fine ceiling and fireplace of a later date—the Elizabethan period, in fact. The existence of this ceiling was unknown a comparatively few years ago. At that time the room was being overhauled, and it was discovered that underneath numberless coats of whitewash—the accumulation of centuries—was this fine Elizabethan work. It is picked out in gold and orange, in keeping with its original design. The fireplace is of similar design, with the royal arms in the centre. It has a fine open-timbered pointed roof of fifteenth-century date, which is equal in construction to the ordinary ecclesiastical work of the same period. The door and doorway inside the room are most beautifully carved. The original mansion was erected about the end of the twelfth century by John Norton, and extended from St. Peter's Churchyard to the river. It was the property of Robert Chambers in 1600, and seven years later he sold it to Robert Oldworthy, whose tomb is in the adjoining church. Whilst it was in Oldworthy's possession the house underwent extensive renovation, and it was probably at this time that the ceiling and fireplace were constructed. After this the building was used for various purposes, until it came into the possession of the Bristol Incorporation. In the boardroom are a couple of very old massive carved oak tables, and a chair which is now used by the chairman of the guardians. This chair is of carved oak, and bears the date 1696.

BRIDGE WITH WILD OVERGROWTH, SHOWING A GOOD COMBINATION OF MASONRY AND VEGETATION.

CLEY CHURCH, NORFOLK.

To be Restored by Mr. Micklethwaite.

FOR a year past a movement has been on foot for the complete restoration of St. Margaret's Church, Cley-next-the-Sea, an object which will involve an expenditure of about £7,000.

Mr. J. T. Micklethwaite, the eminent ecclesiastical architect, has made a very full report on the present condition of the fabric and the repairs he considers necessary to preserve it.

The church was built long before the thirteenth century, which is the date of the oldest work now to be seen. The building was probably completed as it now stands towards the end of the fifteenth century and the beginning of the sixteenth, although the pulpit and other parts of the furniture are of still later date. The font is a good example of a type common in the better-furnished churches in East Anglia. Seven of its sides have representations of the Sacraments, and the eighth one had the Crucifixion. Fanaticism has done some harm to the font, and hard usage and neglect some more, but it remains a good font and needs little doing to it except some repair to the step. There is in the chamber over the porch an oak cover which belongs to the font; it is of the seventeenth century; it is a handsome thing of its kind, and should be replaced. A number of very good pew-ends of the beginning of the sixteenth century are worked up into the modern fittings, and six chancel stalls of the same date remain in the chancel, though they are not in their original places. The pulpit is of the seventeenth century, and is a fine one, in good condition.

Among the other interesting features of the church may be mentioned a fifteenth-century sun-dial, a number of emblems, shields and brasses, and some miserere stalls the carving of which is worthy of inspection. Mr. Micklethwaite says :—

I find that the masonry generally is in fairly good condition, though in many places small repairs need to be done, and in some places missing parts to be supplied.

No Copyism.

The north aisle has lost its parapet, and should have a new one when the roof is repaired. The new parapet should not be a copy of that on the other aisle, but, whilst designed to harmonise with its surroundings, should show itself to be the work of our time. The ivy is doing harm, and should be taken away altogether. If it is left to go on unchecked in the roofless parts of the chapels and the west porch, it will soon bring the walls down. There is some settlement in the tower, which ought to be watched, but so long as there is only one bell, as now, I think it is not likely to get much worse. The bell storey, which is part of the fourteenth-century work, needs attention. Three of the windows are gone, and the fourth is likely to fall out unless taken care of, and there is a good deal of making good wanted to the walls.

A vestry which once stood on the north side of the chancel is entirely gone. It would be useful if rebuilt. There is much damp in the walls, partly due to defects above, but chiefly to the ground outside being in many places very much higher than the floors inside.

On the south side, and elsewhere where it can be done, the ground should be lowered to 6in. below the level of the floor for not less than 6ft. from the base of the wall. But on the north side the floor has from the first been below the ground level, and is so now by many feet. To cut the ground all away would be difficult on account of the graves, and would probably expose the foundation to injury from the weather. I think the best course will be to form a dry area on that side, vaulted over at the level of the ground. The area should be about 2ft. wide and accessible, so that it may be kept clean, and it should be well ventilated. As to the open parts of the chapels, it will be best to clear them of ivy and weeds, and to protect the walls as much as possible from the infiltration of water, but otherwise leave them alone. The west porch ought to have a new roof, that it may serve as a protection to the west doorway, which shows signs of injury from the weather.

Roofs.

The roofs of the nave and chancel are modern. It would be well to replace them with something of better character; but that, not being a work of necessity, must be postponed to others which are. Meanwhile some amelioration may be effected at small cost by painting. The roofs of the aisles and of the south porch are of the fifteenth century, but in so dilapidated a condition that, in estimating for their repair, it is necessary to reckon as for new work. Nevertheless a large part of the carpentry can and ought to be saved. Many timbers are sound except at the ends, and new ends can be fitted to them. But the full extent of the mischief will not be seen till the roofs are uncovered. They should, when repaired, be boarded with oak boarding, over which felt should be spread, and an air space of about 1in. provided between that and the deal boarding to receive the lead. The lead itself should be recast in or near the churchyard, with the addition of new, and laid in the old manner—without the use of wood rolls.

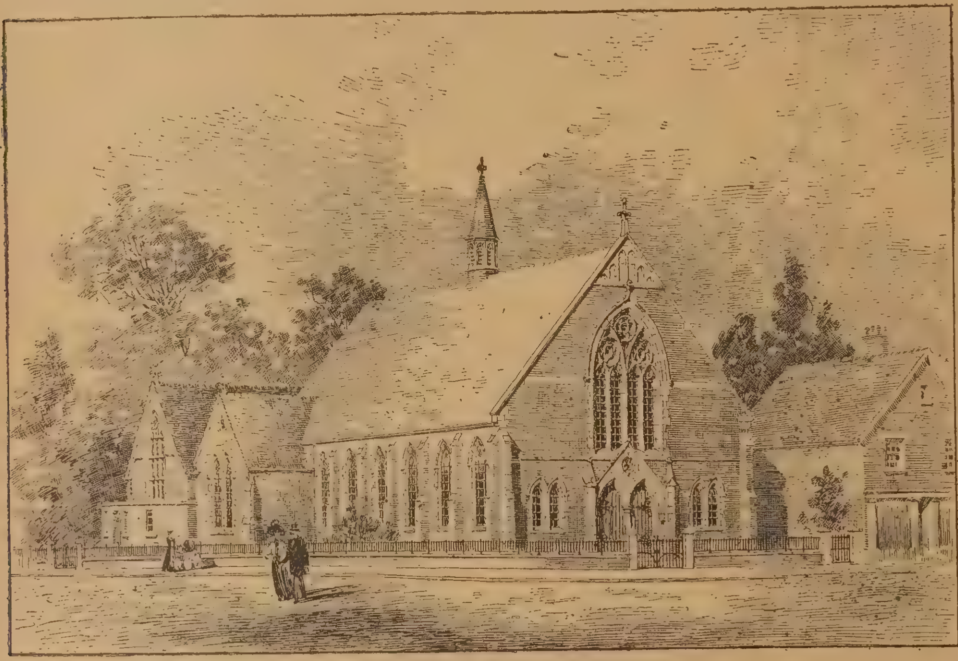
The south aisle is in the worst condition of the two, and its repair should be the first work undertaken. The roof of the porch should go with it, and I reckon roughly that the cost would be between £800 and £900. In this I have not included the portion of the transept chapel within the church, which does not call for immediate attention. When its turn comes it must have a new roof. The repair to the north-aisle roof should come next; and when these roofs and the lowering of the ground are done the rest of the work may be taken in any order most convenient. It will be quite possible to do all that is wanted without putting the church out of use.

Warming the Church.

The only satisfactory way of warming so large a church as this is by water. But it must not be pipes covered by gratings in the floor, through which all the dirt brought into the church is swept down upon them. Radiators connected by covered pipes will do the work better, and they will not disfigure the church more than the floor grates would. When the church is properly warmed there will be no more need to enclose the part of it in ordinary use, as is done now, and in rearranging the building it may be well to provide a little more pew accommodation.

The pulpit stands well and needs no change. The floors of the nave and aisles are generally good enough to keep, and there are in them many interesting grave-stones, some with brasses. The chancel needs to be fitted up for the use of a choir. The altar, which has in it parts of an altar of the time of Charles II., is sufficient, and the old stalls should be kept, but everything else will have to be new. A screen is so necessary to the church that if a good oak one cannot be afforded at present I advise that a simple screen of painted deal be put up, to remain till better may be had. There is not any place in the church suitable for a large organ, nor can one be provided without injury to the building. But a large organ is not wanted, and I advise that you have instead one of Casson's "Positive" organs. In a church so large as this it is convenient to have a side altar for use at services when the attendance is small, and there is a good place for one at the end of the south aisle. The vestry at the north of the chancel ought to be rebuilt, and it may be made large enough to serve a small choir. But if a special choir vestry is wanted it must be provided elsewhere. It has been suggested that the west porch might be adapted to this use; and if the west door is not wanted for a public entrance, which I think it is not, this might be done. The lower storey of the tower might also be made into a choir vestry. The tower itself needs a good deal to be done to it, but it may be left to the last. The masonry and the roof want much repair, and all the floors must be new. It would be well to add one bell to that already there, but the tower is not fit to receive a ring of bells.

The committee propose doing the work in sections as under: (1) Roof of south porch and aisle, (2) roof of north aisle, (3) west porch, (4) external masonry. The work on section 1 is already making considerable progress.



NEW WESLEYAN CHAPEL AND SCHOOLS, STAPENHILL, BURTON-ON-TRENT.
THOMAS JENKINS, ARCHITECT.

NEW STAPENHILL WESLEYAN CHURCH AND SCHOOLS.

THE memorial stones of the new Wesleyan Methodist Sunday Schools which are to adjoin the chapel at Stapenhill were laid recently. The new buildings will be set back from the street, and enclosed within a brick and iron palisading. The chapel will be approached from Ferry Street by the two large entrance doorways which have been designed to make a central feature. These lead into a large vestibule extending the whole width of the chapel, and thus form a convenient lobby for waiting, and hats and cloaks. The chapel will afford accommodation for 400 adults—190 in the central nave, 136 in the side aisles, 50 in one transept and 24 (together with the organ) in the second transept, this latter forming the choir. The roof will be of pitch-pine, and the whole of the constructional timbers will be ornamented, wrought and varnished. The schoolroom will be built at the back of the chapel, and will be connected thereto by means of a large archway, to be filled in with a framed wooden screen, which will be easily taken down when the two buildings are used for special services, school anniversaries, &c. The chapel will be lighted by means of one large four-light window in the front gable, two two-light windows in the transepts, and twelve single-light windows in the aisles. The transepts will be divided from the nave by octagonal stone pillars and arches. The schools will have the entrance from the Dingle, and will provide accommodation for 300 children. These will be provided with two cloakrooms adjoining the entrance vestibule, and at the other end of the schools will be separate lavatory accommodation for boys and girls. The other buildings comprise a minister's vestry, with a separate entrance to the school and chapel, and a kitchen (with the heating apparatus) in the basement below. The heating will be on the low-pressure system, and ventilation will be secured by means of numerous air-inlet panels and roof exhaust ventilating pumps. The drainage will be perfect, and where the pipes in one place pass under the kitchen and passage they will be cast-iron and lined with glass. The buildings are designed in the Early English style of architecture, and externally will be of pressed red bricks with white stone dressings, and the roof covered with red tiles. The glazing will be of tinted cathedral glass in plain ecclesiastical leadings. The contractors for the buildings are Messrs. Thomas & Sons, whose estimate has been accepted at £2,240, and the architect is Mr. Thomas Jenkins, of 35, High Street, Burton-on-Trent.

For the use of the block illustrating these buildings we are indebted to the "Burton Mail."

A SOLDIERS' INSTITUTE.

A CHURCH OF ENGLAND Soldiers' Institute has been erected at Bulford, for the use of troops who from time to time inhabit the huts on Salisbury Plain, at an estimated cost of £6,000. Messrs. Wort & Way, of Salisbury, were the builders, their tender amounting to £4,250 for the building alone. The architects were Messrs. J. Harding & Son, of Salisbury. The building is of one storey, built of timber-framing on concrete foundations, covered with galvanised iron on the outside and lined with felt and matchboarding inside. The roofs are also covered with galvanised iron and similarly lined. The chief feature of the Institute is a large hall 115ft. in length and 42ft. wide. Its height is 11ft. to the springing of the roof and 21ft. to the ridge. This is intended to be used for services and also for entertainments, and will accommodate over 700 men. It is divided into two parts by a rolling shutter, and when not in use for services, &c., one part will form a recreation-room and the other a store-room for spare chairs. The buildings, which are at present lighted with oil lamps, will ultimately be lighted by acetylene gas, generated in a small separate building. The room is also well ventilated and is furnished with panic exits for use in case of fire. At the end of the hall there is a devotional room 32ft. 6in. by 20ft. This is divided from the large hall by a sliding partition, and when the hall is used for divine service will serve as a chancel. At other times the devotional room will be used for daily services. There is a large room on each side of the devotional room, and these will be used as vestries, or as dressing-rooms for entertainments. They are provided with separate entrances. A refreshment-room opens out of the large hall, but is on a somewhat lower level. Its dimensions are 41ft. 6in. by 32ft., and is furnished with a marble counter 32ft. in length. Outside there is a long verandah, where refreshments will be served during fine weather. Adjoining the refreshment-room is a kitchen 32ft. long and 20ft. wide. This is fitted up with two large ranges. Adjoining the kitchen there is a small servants' hall, a copper room and a cook's store. On the east side of the last are placed two small rooms which may be used as private dining-rooms or for various other purposes. There is also a large lavatory fitted with hand-basins and supplied with hot and cold water, and six bath-rooms. The caretaker's house is connected with the main building, and contains twelve rooms, some of which can be used as rooms for visitors. On the basement floor is a good storage cellar, and also a separate large cellar containing a furnace which will supply steam to radiating coils with which the Institute is to be heated throughout.

ON COMMERCIAL TRAVELLERS.

BY AN ARCHITECT.

A RECENT writer in this journal has contributed a most interesting article upon my profession as viewed by a commercial traveller. It may be of some value at this juncture, therefore, to have also the opinion of an architect upon travellers as they are and as they might be; not that my experience of them has been such as to lead me to find fault with them, but, as with every other class of mankind, there are travellers *and* travellers.

Now, unfortunately, in my calling, and as I venture to think also unfortunately *for* it, the commercial traveller is pretty usually classed in the same category with flies and mosquitoes—"nuisances, pests that must be endured." He is generally looked upon as a man whose only duty is to call upon you and waste as much of your time as possible; he carries with him ½in. scale models of closet-basins, or patent ventilators, or, worse still, gaudily-coloured cards of large area whereon are depicted mosaic or other monstrosities, which cards are fitted with hooks and hanging cords complete, ready to be hung in your outer office to become an eyesore to callers and to be a perpetual check upon the incipient artistic tendencies of a budding pupil. That there are many commercial travellers of this type no one will probably attempt to deny, but the fault lies not in the representative but in the firm of manufacturers who distribute such unsightly trash in endless quantities by this means. Even when the traveller does not call with this miserable literature it is forwarded by post, and at Christmas-time the architect's office is inundated with calendars, almost all of them devoid of any attempt at artistic treatment, but usually with great spaces of paper covered by blatant figures in red and black, an inch high, and the name of the month, thus: "September. Send postcard for full particulars of our patent 'Useless' ventilator." Who of us does not know the calendar from which you tear off a page every day and have your feelings harrowed by reading that to-day is July 23rd, and that "'Odours' patent trap is the best on the market" (accompanied by a feeble woodcut of same)?

It is *this* which in the outset renders the commercial traveller an unwelcome guest in our offices; for the rest, sometimes it is the traveller's own fault, but more often it is the architect who is to blame.

The head of the office has grown up in the orthodox belief that a "commercial"—"*only* a commercial" is the usual phrase, and is sufficient of itself to show that the traveller is systematically despised—has no right on an architect's premises, and he carefully inculcates the same idea into every pupil, office boy or draughtsman who enlists under him. When the unfortunate bagman calls he is told—I said it myself scores and scores of times in the days of my pupilage—that "Mr. So-and-So is very busy to-day and cannot see you," quite irrespective of whether the said Mr. So-and-So is up to his eyes in work in the next room or whether he is sitting there leisurely reading his morning paper. In thus dismissing the traveller unheard, the assistant is only carrying out instructions received from his principal, and I doubt whether the principal even is informed that the representative has called. In many offices there is a notice put up on the door to the effect that travellers need not call—just the same as one puts "No Bottles" over the area door to rid oneself of rag and bone men. I do not know what the traveller does under such circumstances, but I presume he goes away in disgust, for there is little doubt of the treatment he would receive if he so far forgot himself as to enter the office.

This treatment is a crying shame in our midst. It is unkind and heartbreaking to the traveller, who is, after all, a man like ourselves, with a heart and finer feelings, and who has his living to get; and also it is unwise and unjust to the architect himself. I am aware that many architects will consider a statement like this heresy and insanity, but I can justify the position I have taken up in every particular; and if I end by winning a few over to my views and obtain in the future a better reception for that fellow-worker the commercial traveller, these words will not have been written in vain.

It is unjust to the traveller for this reason. Between the architectural Lazarus and the commercial Dives a great gulf is fixed, either by the notice on the door or by the cordon drawn across the office by the pupils and other lesser lights of the profession, only, unlike the Scriptural illustration, Lazarus is ignorant that the commercial Dives is calling upon him. So it frequently happens that while the architect sits in his office writing to a certain firm for information upon their goods, the representative of that very firm is being told at the door that there is "nothing on," when he could have saved the time of his employers as well as of the architect. Nor is this all. Suppose now that a traveller having "worked" Manchester reports to his firm that he has called upon every architect in that city, and suppose also that the above-mentioned architect resided in Manchester and sent his enquiry to the traveller's firm so that it arrived by the same post or shortly afterwards; what is the result? The firm immediately concludes that their representative has neglected to call upon this architect, and if this is so in one case, is it not possible that he is not doing his work? And so the poor commercial is severely reprimanded, possibly dismissed, for absolutely no fault of his own, but through the thoughtlessness—it must be thoughtlessness—of the architect. So much for the injustice to the traveller; now for the architect's own injustice to himself.

Our architecture of to-day depends rather more perhaps than we care to admit upon the men who manufacture our materials for us, and these men, each in his own distinct sphere, are constantly spending money and thought in improving their goods, inventing new methods and contriving new fittings and similar details. The architect, to keep up with modern progress and to maintain his position in the ranks of his profession, must be ever ready to give each such invention or improvement at least a fair hearing, if not an actual trial. But how is he to hear of these things? If the manufacturer merely places his new speciality in his catalogue it is usually submerged in such a sea of thousands of other things that it scarcely ever reaches the architect's eye, and still more rarely makes any impression upon his memory. As often as not the whole catalogue is consigned to the waste-paper basket under the table, whence an unsympathetic caretaker removes it and sells it as "old clean paper." Should the manufacturer elect to send notices of it out as a separate paper or pamphlet, it usually arrives in an unsealed envelope, with a halfpenny stamp or "postage prepaid" on it. This immediately betrays its identity to the busy architect, who has many important letters to deal with by the same post, and he unconsciously says to himself "Circular" as he takes it out and tears it up unlooked at. Thus too this method fails to obtain notice for novelties, be they good or bad. And so it is only the commercial traveller who has any chance of obtaining a hearing for his wares; he at least cannot be torn up or sold for old paper. The manner in which he is treated has already been set forth both in the former article by a "Commercial Traveller" and in this present one.

A certain great author who was remarkable for his general knowledge of things was once asked how he managed to acquire so much information, and his reply was very much to this effect: "Try and cajole every person you meet to talk to you upon that subject of which he knows most; lead a country Hodge to speak of pigs and potatoes." This is a saying which may well be taken to heart when dealing with travellers, for often, though certainly not always, they are enthusiastic over their wares and manufactures purely and disinterestedly on account of the sterling value of these commodities, and they know more intimately than the architect ever can the possibilities of the material they are striving to bring before his notice. Not always, I say, because there is a large class who can only be described by that one word, "Bounders," but I have invariably found that men of this calibre travel only with goods as second-rate as themselves. This type comes into the office with more bounce than a millionaire client and generally speaks in a loud voice, possibly in the hope of attracting the principal from his sanctum to discover the cause of the disturbance, and when thus attracted he is pounced upon by the irrepressible commercial. He is *forced* to behave in this manner because he feels somewhere inside him (though he never allows himself even to think it) that he is a cad and his goods are in keeping. Therefore he puts on bounce and adorns his person with what is really incongruous raiment and boldly claims that his goods are "far better than Messrs. So-and-So's and half the price." He rarely troubles to say what their merits are, and if he does he will never guarantee them *personally* when brought to the point.

On the other hand, the respectable commercial traveller, to which class by far the greater majority belong, is conscientiously satisfied that the heavy articles he drags round England day after day and week after week are thoroughly good. He is polite, wonderfully patient (all things considered), and will put himself and his firm to endless trouble to assist architects to his utmost. He is more often than not an expert in his line, and five minutes' talk with him would give one more insight into this particular material than whole hours spent conning over treatises and fingering samples. I say this from experience, for, since the first day that a traveller caught me in the outer office and convinced me of the value of men of his calling in the scheme of creation, I have ever, when free to do so, laid myself open to seeing them, examining their merchandise, and hearing what they have to urge in its favour. I have found them, except the small class already noted, self-respecting gentlemen, knowing the value of their wares and content to leave their future trial to the discretion of the architect, without proceeding to puffing and the production of press notices and a list claiming that every architect that ever lived has used this particular article of commerce ever since Noah designed and built his ark! Within the last few weeks a traveller came to me with a model of some patent folding partitions—and they were, without doubt, the very best possible contrivance that could be used under many circumstances: they folded up, they folded down, they went round the corner, and when you had finished with them they folded up flat against the wall, and practically no space at all was taken out of the room. My object in mentioning this is that had I adopted the usual practice and refused to hear this caller, I should still be in happy ignorance that anything so compact and useful had ever been invented; for he called with his model, left his card and then went on his way. It may be mentioned here that it is not the usual practice for a traveller to say his say about his goods and then go off to continue his journey; and while I quite agree that a traveller *may consider that it is necessary* "to talk to a man on his own ground as well as your own," and be able to discuss James I. or the French Revolution or what not, it gives neither the architect nor the traveller a good opinion of the business capacity of a man who wastes his own and other people's time in introducing such foreign and out-of-place subjects during what ought to be from its very nature a strictly business interview. I have had considerable experience of this phase of the commercial traveller as well, and have unwillingly been drawn into discussing Unitarianism and other matters when I would far rather have been left free to return to my drawing-board and get on with my work.

Let architects and travellers learn to have a wholesome regard for each other—the architect for the work and feelings of the traveller, and the traveller for the value of an architect's time. Let manufacturers, the prime cause of all the evil, exercise a little care and tact in their leaflets and contrive to produce a sensible and modest notice which shall not offend an artistic mind. Above all, let these last-mentioned manufacturers select their travellers with care, choose gentlemen of business instinct and not cads of great pushing capacity; for to send one of these latter to interview a respectable architect (given that he succeed in reaching him) is disastrous to the manufacturer's chance of doing business, and tends to bring commercial travelling as a calling under quite unnecessary and generally undeserved opprobrium. I have in my mind at this moment a glaring instance of tactless traveller's work which bears out what I have said in the fullest degree. There is a certain (second-rate, as will be seen) firm in London who manufacture drawing materials and employ travellers to hawk them round the country. One of these has called upon me here occasionally and has never yet left my office without raising in my bosom an unchristian desire to throw him into a horsepond for a flashy and dishonest cheapjack. I fancy he considers himself a splendid man of business, and he has a method of attack which is all his own. He begins with dropping long shots—that is to say, about a week before he descends upon you, to jar your feelings and make you vow internally never to patronise his firm, he sends you a highly glazed pink-on-one-side-and-white-on-the-other "business" card announcing that "our Mr. X. Y. Z. will call upon you in a few days to introduce," &c., &c. Well, I waited for my beheralded traveller with much interest. He came; he was just the type of cad I expected to see. I gave him an order. The goods on arrival were inferior and not even of the sizes he had mentioned. This man still calls and still (kindly) warns me by post of his pending visit—and, like probably every other architect, I am *out* when he arrives on my threshold. The moral is obvious.

Builders' Notes.

A New Hospital for London.—The Local Government Board have sanctioned the erection of a new hospital in South London at a cost of £284,000.

The Isolation Hospital, Ystrad, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves, with descending smoke flues and patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

A New "Prismatic Rolled Glass" is being made by Messrs. Pilkington Brothers, Ltd, at their St. Helens Glass Works. The section of this glass shows a saw-like edge, with the teeth pointing in an upward direction. Glazed as directed, it adds considerably to the illuminating power of a window and is most valuable for lighting rooms ordinarily dark. It is made up to 38in. high or 90in. wide. Any smaller size within these limits can of course be had.

A Builder's Failure.—A first meeting of creditors has been held under the failure of Charles Simmonds, a builder, of Leytonstone. Since 1889 the debtor has built about 400 houses, chiefly in the neighbourhood of Forest Gate, but also at Thornton Heath, Barking Road and Ponder's End, the necessary capital being obtained principally by advances under building agreements. The accounts show liabilities £25,379, of which £23,020 is treated as fully secured, and an estimated deficiency in assets of £2,270. The case was left in the hands of the official receiver.

The Peterhead Master-Builders' Association held its annual meeting recently, Mr. Alexander Webster, president, in the chair. The following office-bearers were elected for the ensuing year: President, Mr. Alexander Milne, engineer; vice-president, Mr. J. B. Dickie; committee: Messrs. J. Ferguson, plumber; A. Ferguson, painter; A. Webster, builder; James Taylor, junior, builder; Shand, plasterer; West, builder; and Williamson, blacksmith; secretary and treasurer, Mr. A. Clark Martin, solicitor. Messrs. J. B. Dickie, W. Stuart and A. Webster were appointed delegates to the annual meeting of the Scottish Building Trades' Federation.

Technical Building Instruction in Australia.—Mr. Gurr, the Minister of Public Instruction at Melbourne, was recently asked by a deputation from the Plasterers' Union supported by the council of the Working Men's College and the Trades Hall Council, to grant a sum of money to enable a class to be started at the college for instruction in plastering. The decadence in the apprenticeship system throughout Victoria and Australia was referred to, and it was stated that employers only partially taught boys their trades, and it was only by means of technical schools that skilled artizans could be turned out. The formation of a plasterers' class would not be expensive, as a suitable small iron shed could be erected on the ground floor at a trifling cost. It was thought that the Government should go further, and provide facilities for teaching the cognate trades of bricklaying and stonemasonry. Several plasterers addressed the Minister, complaining that there was no means of properly learning the trade in Victoria. Many who were reckoned tradesmen were quite ignorant of the higher branches of the calling. Only plasterers or plasterers' apprentices should be enrolled in the class. They did not want men who earned their living in other ways to come in and "play" at the classes. Mr. F. A. Campbell, director of the college, said he believed the establishment of a plasterers' class would have a very beneficial effect. But any additions to the college buildings should be on permanent lines. It would cost less than £1,000 to erect proper accommodation for the teaching of the three building trades that had been mentioned. An expenditure of £300, with £150 a year for maintenance, would suffice if provision were to be made for teaching plastering only. The Minister said that if he decided to form a plasterers' class it would probably lead to the establishment of bricklayers' and stonemasons' classes also. The Government fully recognised the importance of technical education, as the legislation it intended introducing would show. He wished to grant the request of the deputation, but before he could make a promise he required to know exactly what the cost would be. He asked to be furnished with plans of the proposed new building, and he would consider the matter with a desire to help the plasterers.

Masters and Men.

Barry Carpenters' Strike.—The Barry Master-Builders' Association has decided by a unanimous vote to refuse the demand of the carpenters and joiners of the district for an advance of wages of a halfpenny per hour until they are in a position to make a similar advance to the other branches of the building trades in the town. The carpenters' strike in the district has now been on for quite sixteen months.

The Trades Union Congress last week passed the following resolutions: (1) "That this congress expresses its strong admiration at the courage and behaviour of the Bethesda quarrymen during their long and arduous struggle to free themselves from the trammels of serfdom and establish the principles of combination; and, further, this congress emphatically condemns those in authority who are responsible for the drafting of the military and police forces into the district, there being absolutely no grounds for such unwarranted action. And this congress recommends the societies represented here to grant the Bethesda quarrymen a sufficient and regular income so as to enable them to carry on the struggle to a successful issue." (2) "That this congress considers it is imperative in the interests of the building trade workers that inspectors should be appointed for the proper inspection of plant and machinery on buildings in the course of erection or demolition, and regrets that the Government through the Home Office has not seen its way either to adopt the necessary safeguard or to permit of such regulations as will give the present factory inspectors more power and authority for such inspections; further, this congress protests most emphatically against permission being given to employers of labour to work women and young persons overtime, and instructs the Parliamentary Committee to use all legitimate efforts to stop such practices." Mr. Thomas Costigan, secretary to the London Master-Builders' Association, with reference to the statement made by Mr. Edward Browne, counsel to the congress, that it behoved that conference to take into consideration seriously the question whether or not, in view of the extraordinary attack that had been made on trade unionism, the congress should unitedly empower some body to see that there was no principle of law established against trade unionism by attacks on unions which were numerically and financially weak, writes as follows: "'Smashing trade unions' is an old and ever-recurring cry; it has been raised on every occasion when employers have attempted to resist trade union aggression; it is worn threadbare now and has degenerated into a senseless and ludicrous expression, preserved for the benefit of the ignorant and unthinking. If the learned counsel had said 'reasonable defence of their rights and freedom on the part of employers,' instead of 'extraordinary attack that had been made on trade unionism,' and followed it up, he would have been nearer the mark. The unions and trades that are 'numerically and financially weak' run far greater risk of being injured or exterminated by the 'numerically and financially' stronger unions than by any action of the employers, and of this risk eloquent examples are not wanting."

Engineering Notes.

The Borough Technical School, Shrewsbury, has lately been fitted with the latest improved low-pressure hot-water heating apparatus by Messrs. John King, Ltd., engineers, of Liverpool, including their Rahnee radiators.

A Price List for Engineers.—A new edition of "The Engineering Price List" has just been published by Messrs. James Truscott & Son, Suffolk Lane, Cannon Street. The work has now been issued for the past eight years, and is a most valuable volume for all interested in engineering as buyers, sellers or agents. The list gives the name of practically every firm of standing in the trade. A very noticeable feature is the printing in English, French and Spanish of the general index, which shows under the different headings the firms who deal in the particular classes of goods mentioned.

Law Cases.

Preston Royal Infirmary: Unsuccessful Claim against the Architect for Glazing.—At the Preston County Court recently an action which occupied considerable time was one remitted from the High Court, in which Messrs. Helliwell & Co., Ltd., proprietors of a patent glazing establishment at Brighouse, Yorkshire, claimed £56 15s. 5d. from Mr. F. E. Dixon, architect, of Preston, for glazing work done at the new operating theatre at the Royal Infirmary at Preston. Defendant admitted that the sum of £56 15s. 5d. was the contract price; but he did not admit that the amount was due from him to the plaintiffs. The question was whether or not Mr. Dixon was personally liable to the plaintiffs for the amount. Mr. Lawrence (plaintiffs' counsel) said it was mentioned in one of the letters that passed between the parties that Messrs. Walmsley, of Fishergate, were responsible for the glazing. Every one knew that an architect did not put up an operating theatre for his own use but for the use of someone else, but he submitted that whether Messrs. Walmsley or the Infirmary Committee were going to do the glazing work Mr. Dixon made himself liable. Mr. Walter Davies, secretary to the Preston and County of Lancaster Queen Victoria Infirmary, said when he made the affidavit referring to the contract with Messrs. Walmsley, and stated that the glazing was reserved, he believed it to be true. Cross-examined by defendant's counsel, he stated that he subsequently learned the statement in the affidavit was not true, and an interpleader action which had been commenced between Messrs. Helliwell, Messrs. Walmsley, and the Committee was withdrawn. The original contract which was made with Messrs. Walmsley on December 7th, 1899, was for £672 1s. 8d., and included £65 for glazing. For the defence Mr. Dixon was called, who said he was the architect for the new wing at the Infirmary. The contract which was entered into with Messrs. Walmsley was for plumbing, decorating, glazing and electric lighting. Messrs. Walmsley's specification included a prime cost item, viz., the patent glazing—or an item put down in the general contractor's contract which he himself was not able to price. This was a general practice among architects and contractors. Before the contract was entered into with Messrs. Helliwell they knew that there was a main contractor, but they did not know who it was. On March 13th he wrote to Messrs. Helliwell stating that he had certified the amount of their tender to Messrs. Walmsley. The plaintiffs got their instructions from Messrs. Walmsley—in fact, the work was not commenced until Messrs. Walmsley had written them asking them to send over a man to confer with the plumber and joiner. His Honour said that all through the correspondence Mr. Dixon never made reference to the principals; but people must know very well when they were dealing with an architect over a big building like the Infirmary, and eager to do work on that building, they were dealing with him as an agent. They must have known that behind Mr. Dixon there was a responsible body. There was no suggestion that Mr. Dixon had any authority for making the contract. The claim against him was as principal of the contract. The action must, therefore, be dismissed with costs.

A Contract for some Kensington Flats.—Mr. Godfrey Pinkerton has published his award in the matter of the arbitration between John Thomas Hockley, a builder of Grantham (trading as R. Hockley & Son), and the trustees winding up his estate, Messrs. John Simpson (Grantham) and J. T. Medcalf (London), against Henry Metcalf and Thomas R. Greig, trading in co-partnership as architects in London. The dispute arose on a contract entered into by Hockley with Metcalf and Greig to build some large flats known as Iverna Mansions at South Kensington, London, for the sum of £25,762. Hockley did a large amount of work on the contract, but in consequence of the failure on the part of Metcalf and Greig to keep up their payments under the contract Hockley stopped work and ended the contract. Over and above the amount paid on the contract by Metcalf and Greig prior to the stoppage of the works Hockley claimed there was due for work actually executed a large sum of money. It was also claimed that Metcalf and Greig had been guilty of a breach of contract, and that Hockley was entitled to damages from Metcalf and Greig for loss on plant, &c., and of profit on the contract. On the other hand Metcalf and Greig contended that Hockley had been fully paid for all the work he had done, and that he was not justified in stopping the work, and that he had committed a breach of contract; and they claimed over £6,000 damages for their loss in consequence. The arbitrator decided and adjudged (1) that the sum of £2,025 1s. 9d. was due from Metcalf and Greig in respect of work executed by Hockley, the value of which he fixed at £17,169 1s. 9d.; (2) that Metcalf and Greig should pay the sum of £764 for loss incurred by Hockley upon plant and material supplied on the contract; (3) that there was nothing due from Hockley to Metcalf and Greig in respect of damages claimed by them; (4) that Metcalf and Greig should pay the costs of and incidental to the reference and the costs of the award as between party and party; (5) the arbitrator also decided that there had been a breach of contract on the part of Metcalf and Greig, and that Hockley was entitled to the sum of £1,183 for loss of profit on the contract—the total sum under which Hockley would have been entitled to be paid, had he completed it, amounting to £29,000. As regards the last item of the award the arbitrator reserved a point of law, which is to be submitted in the form of a special case to the High Court.

A.A. PRIZE LIST.

THE following is the prize list of the Architectural Association for the session 1900-1901:—

A.A. Travelling Studentship, value £25, *and Bronze Medal*, J. E. Forbes; *Second Prize, value* £5, L. G. Detmar.

A.A. Medal, value £10 10s., G. Drysdale.

Banister Fletcher Bursary, value 25 *guineas*, and *Medal*, T. F. Green; *Hon. Mention*, A. C. Bossom.

Andrew Oliver Prize, value £5 5s., D. Anderson and R. E. Stewardson—equal (prize divided).

Architectural Union Company's Prize. Not awarded.

Essay Prize, G. H. Lovegrove.

LECTURES.

Division I.—E. Gunn, A.A. Scholarship, value £4 4s.; H. E. Rider, prize value £1 1s.; H. F. Tasker. *Division II.*—L. W. Ensor, prize value £2 2s.; H. Greenly, G. Walker.

STUDIO.

Division I.: Construction.—D. W. Stewart, prize value 10s. 6d. *Division II.: Time Sketches.*—C. M. Crickmer, prize value 10s. 6d.

Order of Merit.

LECTURES. DIVISION I.

Greek and Roman Orders.—E. Gunn (book prize), C. J. Goodwin, W. S. Dakers. *Elementary Construction.*—H. E. Rider (book prize), T. L. Dale, E. Gunn. *English Architecture.*—E. Gunn (book prize), T. L. Dale, C. J. Thompson. *Mediæval and Renaissance Architecture.*—F. W. Tasker (book prize), E. Gunn, H. E. Rider. *Elementary Physics, Formulæ and Calculations.*—D. Anderson (book prize), E. Gunn, H. E. Rider. *Plane and Solid Geometry.*—E. G. Allen (book prize), C. J. Goodwin, A. F. Benjamin.

LECTURES. DIVISION II.

Materials, their Nature and Application.—H. Greenly (book prize), W. J. Davies, F. W. Williams. *Construction.*—L. W. Ensor (book prize), P. J. Westwood, G. Walker. *Drainage and Water Supply.*—L. W. Ensor and H. Greenly (book prize); S. Towse and G. Walker; K. D. V. Robinson. *Ventilation, Lighting and Heating.*—L. W. Ensor (book prize), H. Greenly, G. Walker. *Professional Practice.*—L. W. Ensor, W. L. Clarke, G. Walker. *Mensuration, Land Surveying and Levelling.*—L. W. Ensor (book prize), P. R. Smith, N. C. Smith. *Elementary Class of Design.*—Prize value £3 3s. and Bronze Medal, E. G. Theakston; Certificates, H. Hyams and R. E. Stewardson; Certificates, A. E. R. Gill and W. C. Lemaitre. *Advanced Class of Design.*—Prize value £5 5s. and Bronze Medal and Pass for Modelling Class, A. Wingate; Certificate and Bronze Medal and Pass for Modelling Class, A. Durst; Passes for Modelling Class, A. A. Carder and E. Brantwood Muff.

Bricks and Mortar.

APHORISM FOR THE WEEK.

The object and intention of all the Arts is to supply the natural imperfection of things, and often to gratify the mind by realising and embodying what never existed but in the imagination.—SIR JOSHUA REYNOLDS.

Our Plates. ST. MARY'S CHURCH, Eccleston, near Chester, has recently been built from the design of Mr. G. F. Bodley, A.R.A., of Gray's Inn, W.C. It is built entirely of the local red stone inside and out, and the roofs covered with lead. The church was by the munificence of the late Duke of Westminster made complete in every way, the windows being all filled with stained glass, and the furniture in English oak and in marble being all in their places. The fabric is vaulted in stone throughout, and the floor laid with marble and oak. There is a massive tower at the west end. The church is chiefly lit by clearstory windows. The chancel is formed by oak screens richly carved. The reredos rises up to the window, and is of elaborately carved red stone with gilding. The organ is placed over the tower arch, and is of carved and gilded oak-work. There is a rich monument with an effigy of the late Duke, under a canopy. The fabric was built by Mr. Franklin, of Deddington, and the glass was carried out by Messrs. Burlison & Grylls. It is seldom that a modern church is made so comfortable in every respect. The proportions are striking, and the detail throughout has been carefully studied and ably carried out.—The new church at Kensington is to be built in an important position near the Albert Hall. In plan it will consist of nave and aisles and an additional aisle on the one side, an arrangement that suits the site. There will be lofty piers and arches, and stone arches will be thrown both across the nave and the aisles, acting as internal flying buttresses. The chancel will be formed by a high open screen. The nave will be spacious and of considerable height—though none too high for the large buildings which will be near. It is proposed to have the building of stone throughout, while the roof may be eventually painted decoratively. The church has been designed by Mr. G. F. Bodley, A.R.A., of Gray's Inn, W.C. It is hoped that the building may be commenced soon if funds come in.—The question of the provision of a new Central Police Station at Hull has been under consideration for some years. The plans finally adopted propose to utilise the site of the existing police station in Parliament Street with the addition of a commanding corner position at the junction of Alfred Gelder and Parliament Streets. The ground floor plan on p. 70 will show the arrangement. The new building will be in close proximity to the Town Hall and Police Court, and within two minutes of Victoria Square, the centre from which all the electric cars radiate. The public entrance and all the offices are on the Alfred Gelder Street front, while the prisoners' entrance and police departments are in Parliament Street. The work, which is to be commenced immediately upon the removal of the present buildings, will be carried out under the direction of the City architect, Mr. Joseph H. Hirst, M.S.A.—St. Botolph's Church, Carlton-in-Cleveland, of which Mr. Temple Moore is the architect, is designed in the fourteenth-century style, and consists of a nave and chancel under one continuous roof, north and south aisles, west tower and porch. The building is faced both inside and out with local freestone, and accommodates about 250 people at a cost of about £3,000. Mr. Brotton, of Bilsdale, was the contractor. The present church succeeds an old one, which immediately after having been rebuilt some twenty years ago was destroyed by fire, and remained in a state of ruin till about five years since, when the present vicar, the Rev. T. L. Kyle, undertook the building of the new church on the old site. The building, though very simple in detail, is well proportioned and has a dignified effect both externally and internally. A striking feature of the interior is the stone-vaulted gallery under the west tower. The body of the church is divided from the north and south aisles on each side by three wide arches, and there is a handsome five-light east window. The roofs are of oak, and the east ends of the aisles are screened off to form the vestry and organ chamber by simple oak screens.

St. Helens Town Hall Square. THE work of rearranging the property in front of the St. Helens Town Hall and clearing a space of about 4,000 sq. yds. in order to form an open space in front of the Town Hall and Gamble Institute is being pushed on rapidly, and it is expected that by May 1st next year the new buildings fronting the square will be completed and ready for occupation. Messrs. Briggs & Wolstenholme, the architects, have arranged a line of buildings in harmony with the Gamble Institute, which contains the free library and technical schools. The formation of the square at a remarkably low cost has been rendered possible by the munificence of Mr. Walmsley-Cotham and Sir David Gamble, Bart., who have both given valuable spaces, which are to be cleared of buildings. New buildings are to be adapted to the needs of some of the tenants who are being dispossessed by the alterations. The new buildings will be of Ruabon bricks, with terra-cotta dressings. Immediately the disturbed parties are settled in their new premises, Mr. Joseph Ellison, the builder who is carrying out the work, will have the new space cleared and the square finished as rapidly as possible.

A Visit to Hitchin. A VISIT to Hitchin was paid recently by the East Herts Archæological Society, the St. Albans and Herts Archæological Society, and the Hitchin Natural History Society. Mr. H. F. Hatch, of Hitchin, had been chiefly responsible for the arrangements. St. Mary's Church, Bancroft, was first visited, where two papers were read. The first, by Mr. Walter Millard, dealt exclusively with the manner in which the church—which is the largest in Hertfordshire, except St. Albans Cathedral—came to assume its present form. Mr. Millard regarded the date of the oldest part of it to be about the end of the twelfth or the beginning of the thirteenth century, and proceeded to show the respective dates of alterations, additions, &c., in an interesting manner. Mr. T. Geoffry Lucas followed him, and in an exhaustive paper dealt in detail with the whole of the building, exhibiting several plans and drawings to illustrate his remarks. It is specially worthy of note that the church is supposed to possess a genuine Rubens representing the offerings of the Magi. An outside inspection was also made under the guidance of Mr. Millard. "The Biggin" (Norman-French "Béguinage," nunnery) was next visited, and an interesting account was given by Mr. G. Aylott. Up to the time of the suppression of monasteries by Henry VIII. this building was occupied by an English order of nuns known as the Gilbertines. The order was established by St. Gilbert, who was born in the year 1089. In the seventeenth century the building was converted into a school by one Joseph Kent, who left it as an almshouse to the town, for which purpose it is at present used. The Biggin contains eighteen rooms. After this a brief visit was paid to the Cooper's Arms Inn, where the principal object of interest is a fine window dating from early in the sixteenth century, and some observations on the house were made by Mr. Aylott. The party then started for Fairfield, and on the way some of them visited the back premises of The Angel Vaults Inn to see some very ancient woodwork. At Fairfield the large collection of local antiquities possessed by Mr. W. Ransom was seen.

English Stained Glass for Germany. MESSRS. J. POWELL & SONS, of the Whitefriars Glass Works, Tudor Street, E.C., have just completed an order for an east window to be set up in the Immanuelskirche, Frankfurt. The event is probably unique. English windows have before now been placed in English churches abroad, but, so far as we know, never in foreign churches. The window was designed by Mr. J. C. Powell. One reason why the new window was ordered from Messrs. J. Powell & Sons is that the donor favoured decorative work of the mosaic order as against the picture-method of the German artists. The window is a brilliant piece of work, the predominating colour in which is ruby red. There is a great deal of elaborate detail, the design being made up of vine leaves running down the sides of the panels, with the figures in the centre. In principle the work is a reproduction of the old mosaic glass of the thirteenth and fourteenth centuries, but the treatment is modern. The background of the window, which is a five-light, its dimensions being about 15ft. by 12ft., is formed of mother-of-pearl coloured pressed glass, through which the light shimmers gently. The main group represents the Adoration of the Infant Christ by the Magi and the shepherds, with the bright star overhead. Under this is the inscription, "*Got mit uns*" (God with us), and on either side are figures of Christ as the Good Shepherd and the Intercessor. Below are other groups, the principal of which are St. Michael—an angelic figure in armour bruising the serpent, with Adam and Eve in the background—the sacrifice of Isaac, Moses raising aloft the brazen serpent, and Zion rejoicing at the entry of Christ into His Kingdom as prophesied by Zachariah.

Mr. Alfred Waterhouse's Works. MR. ALFRED WATERHOUSE, R.A., who is at present somewhat seriously ill, was born at Liverpool seventy-one years ago, and studied his profession in the neighbouring city of Manchester. Richard Lane was his tutor, with whom he worked for some time, and afterwards travelled in Italy and elsewhere, eventually settling down to practise in "Cottonopolis." His first considerable work was the Manchester Assize Courts, his design for which was the best in a very keen competition. The County Jail, the Owens College, and the Town Hall were all designed by him. At Liverpool he has erected the London and North Western Hotel, the Seamen's Orphanage, the Royal Infirmary, the Turner Memorial Home, and the Royal University College. In London we have his work in the pile of buildings in Whitehall Court known as the National Liberal Club, in the Prudential Company's new offices in Holborn, the Surveyors' Institute, the University College Hospital, and others. Oxford Colleges have been restored to designs by him, and many country mansions built by Mr. Waterhouse. Eaton Hall, Cheshire, the seat of the Dukes of Westminster, was erected by him. He has been made a member of many foreign institutes and societies of fine arts and had diplomas and decorations awarded him. Our own Academy made him an A.R.A. in 1878 and a full member in 1885. He has been President of the Institute of British Architects, whose Gold Medal he holds. He owns about 700 acres in Berkshire, where he likes to be in the summer. His chief recreation is painting with oils or water-colours. He was married over forty years ago.

The Late Mr. Charles Dorman. WE regret to announce the death of Mr. Charles Dorman, senior member of the firm of Messrs. Charles Dorman & Son, architects and surveyors, Abington Street, Northampton, which took place at his residence, 51, Abington Street, last week. Mr. Dorman, who went to Northampton from Uppingham, started business in that town in 1882, and in 1897 he took his own son into partnership with him. Deceased, whose age was sixty-three years, was a very successful architect, and had been connected with the erection of many large and prominent buildings in Northampton, notably Messrs. J. Manfield & Sons' manufactory, Messrs. H. E. Randall's, Ltd., manufactory, Mr. Davis's leather warehouse in Ladies' Lane, Messrs. G. M. Tebbutt & Son's factory in Clare Street, Stimpson Avenue Board School, Military Road Board School, the Free Church in Kettering Road, the Nursing Institute in Barrack Road, and many other works in the county. One of the latest buildings which had been erected under his supervision was the Congregational Church in Abington Avenue, Northampton, which was only opened this year, and the firm is at present engaged on a big factory at Leicester for Messrs. J. Cooper & Sons, of Northampton, which is 300ft. long and 120ft. wide. The deceased also acted as surveyor to the St. Andrew's Hospital, Northampton, and to Holloway's Sanatorium at Virginia Water and to their house at Brighton. Mr. H. C. Dorman, his son, will carry on the business.

A BEAUTIFUL YORKSHIRE CHURCH.

IT is not long since the west front of the cathedral at Peterborough—one of the greatest triumphs of architecture in Europe—was successfully restored and saved thereby from falling into ruin. The abbey of Peterborough was of old one of the most important of the ecclesiastical foundations of England, and, like St. Albans and other great abbeys, it possessed manors, churches and estates all over the country. Among the possessions of the abbey of Peterborough in its early days was Howden, in Yorkshire, fifteen miles south-east of York, where in Saxon times there was a church maintained by the abbot of the parent abbey. As early as the time of the Conqueror Howden passed into the possession of the Bishops of Durham, who had a manor-house there. In 1267 the church was made collegiate, and the rebuilding of the Norman structure was commenced on a grand scale. From that time and through the fourteenth century—the period when Gothic architecture rose to its sublimest height—the rebuilding of Howden was continued. The nave, with its beautiful west front, dates from the end of the thirteenth and beginning of the fourteenth century, when the Early English style was at its full development; the choir was erected when the finest of all the Gothic periods—the Decorated—was in its prime. Bishop Skirlaw built the exquisite chapter-house (1388–1406) and left money for the erection of the central stage of the splendid tower. Later, towards the end of the Gothic period, the Perpendicular belfry stage was added.

Howden church is thus an almost complete example of Gothic architecture for the three centuries during which it flourished in this island, and it is justly celebrated, even in a county so rich in mediæval remains as Yorkshire, as one of the most glorious achievements of the church builders of the Middle Ages. It is one of those heritages of the past the value of which the present has only of comparatively late years recognised. It is to those who wish to preserve what remains of that heritage that the vicar of Howden (the Rev. W. Hutchinson) and his churchwardens appeal to maintain what was once the chief glory of their church, but is now a ruin.

The collegiate establishment of Howden was dissolved by Edward VI., and the confiscation of the prebends diverted funds which should have been devoted to the repair of the fabric into "private hands." The nave and transepts continued to be used as the parish church, but the choir was abandoned early in the seventeenth century; the lead was stripped from its roof in 1634, and the proceeds of its sale presumably fell, as usual, also into "private hands." The vault of the choir, thus deprived of its protection from wind and weather, fell in 1696; in 1750 the vault of the chapter followed. The exquisite work of the finest period of Gothic architecture and a noble example of the later Gothic were thus left bare, and from that time to this little or nothing has been done to counteract the complete destruction which threatens the whole eastern part of the church.

The object of the appeal now made is to preserve the ruins and not to restore them. In 1896 Mr. John Bilson, F.S.A., was asked to report on the condition of the church, and he stated that the choir and chapter-house urgently required attention. They are necessarily much exposed to the weather, and in many parts Mr. Bilson found the masonry suffering severely from the effects of water finding its way into the walls through the open joints—defects which are indicated by the growth of vegetation on the upper parts of the walls. "Repairs," said Mr. Bilson, "are the more necessary here because the east end and the chapter-house justly rank among the finest architectural achievements of their respective periods, and further injury to them would be most disastrous." Some local subscriptions were obtained and repairs undertaken; the turrets of the west front and the south wall of the choir were taken in hand, and all that could be done with the money that was provided was done. But the funds so raised were not sufficient to enable anything to be done to the eastern gable of the choir and the chapter-house. In 1896 some of the tracery fell from one of the chapter-house windows, and last year some more tracery fell from another. For the last ten years vegetation has been flourishing on the apex of the beautiful gable of the east end, and is pushing out the stones of the remarkable gabled finial with which it is crowned. Unless, therefore, repairs are immediately undertaken this beautiful work must soon perish.

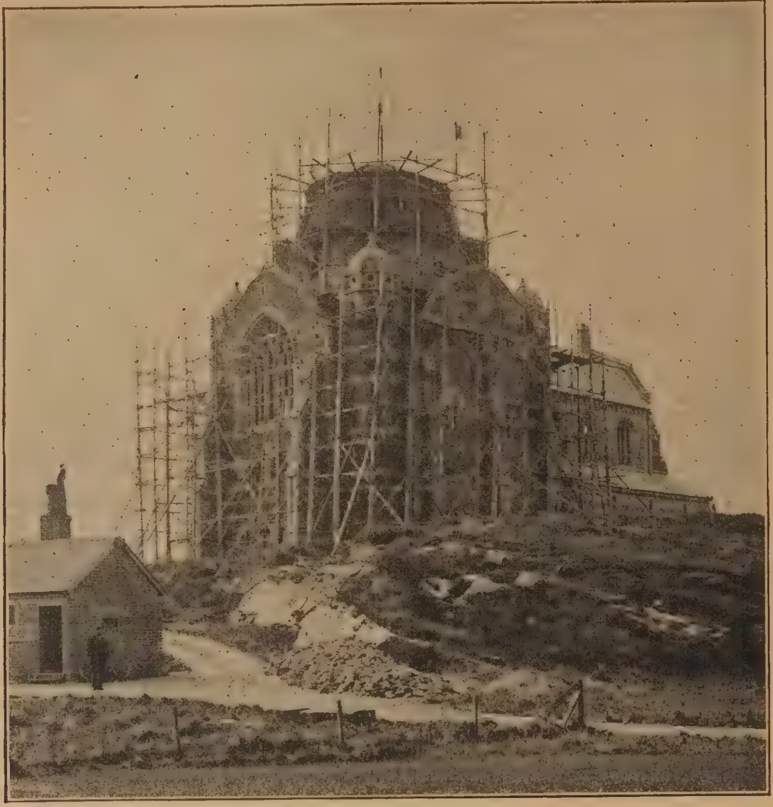
Howden is not a wealthy town, and the church has no funds available for the repair of the fabric. The nave and transepts are maintained by the parishioners, but the repair of the ruined parts of the church is beyond their resources. The sum required to secure the choir and chapter-house from further ruin is only £2,000, and, as stated, the object is to preserve and not to restore. Not a single old stone is to be replaced by new, and no stonework will be inserted except where this is found to be a necessity to secure the stability of the structure. The Society for the Protection of Ancient Buildings has examined what has already been done, and the secretary has written his opinion that the work carried out by Mr. Bilson was done strictly in accordance with the principles of the society. The undertaking for the preservation of the church has the cordial approval of the Archbishop of York and of the East Riding Antiquarian Society, and it is hoped that a generous response to the appeal issued by the vicar will enable the work of repair to be put in hand at once. The vicar of Howden (the Rev. W. Hutchinson), the churchwardens (Messrs. G. H. Anderton and Robert Briggs, of Howden the York City and County Banking Co., and the Yorkshire Banking Co., both of Howden, will receive subscriptions.

BELFAST ROYAL ACADEMICAL INSTITUTION.

THE Royal Academical Institution, Belfast, dates its foundation from 1810. Several additions and alterations have now been made. The house which was until recently occupied by Dr. Sheldon has been converted into a physical laboratory, the special necessity being to get proper accommodation for the science and art work of the school. The new laboratory is nearly 53ft. long, and is situate on the ground floor, the interior walls having been cut out in order to extend the accommodation. The floor has been laid in concrete to a depth of 9in. and finished in cement. Above this there is a layer of tar, surmounted by an oak block floor, the whole giving a rigidity and noiselessness obtainable in no other way. The floor, too, is insulated from the walls, and the instruments which will be used will thus be entirely free from the least vibration, this being absolutely essential to the proper working of this department of the school. The room has been further improved by a number of new windows. In immediate proximity to this room is one of the old English classrooms which has been made into a gallery lecture-room, and the wall opposite the place constructed for the pupils will be left white so as to serve the purpose of a lantern screen. Another of the old English classrooms has been converted into a suite of administrative offices. The new office is much larger than the one which previously existed, and in addition to this is a well-appointed waiting-room for visitors, the principal's apartment and a master's common room. The stairway at the main entrance has been carried to the top of the building, thus bringing into use a great deal of additional accommodation. The old commercial and writing room with some space from the house, has been made into a common hall. In order to take the place of the walls which have been removed from the house formerly occupied by the headmaster steel girders have been thrown across to carry the superimposed weight, these being supported by metal columns. The first floor of the old house is devoted to the English classroom, and the side walls have been pierced with new windows in order to obtain more light. The ceiling of one of the old dormitories has been entirely removed, and six lights have been placed in the roof. This room, which is over 60ft. long, will be used for commercial and art instruction. At the back of the laboratory is placed a stairway carried up to both floors above. The new cloakroom is a spacious apartment, the feature of which is an arrangement for driving hot air from the central furnace underneath the coats and other garments of the pupils, so that on the most rainy day the outer clothing will be completely dry when school is over. The games material room is also a large one; while there is an extensive system of lavatories constructed on the most approved sanitary principles. A covered granolithic playground has been constructed. The contractors, Messrs. M'Laughlin & Harvey, have only been allowed a couple of months in which to carry out this extensive series of alterations, and no effort is being spared to finish the contract in time for the reopening of the school, which is fixed for September 2nd. The architects are Messrs. Blackwood & Jury. A new system of artificial ventilation has been introduced, on the design of Messrs. Davidson, of the Sirocco Works, Belfast. By this contrivance hot air will be driven electrically through ducts, which are carried into every classroom in the building, so that the air can be changed, if required, no fewer than seven times an hour.

THE NEW YORK STOCK EXCHANGE.

BUSINESS on the New York Stock Exchange has grown so rapidly in volume and importance that a new building is to be erected at a cost of 3,000,000 dols. The new building, which is now approaching completion, has its principal elevation to Broad Street and is in the Corinthian style. One of the most worrying considerations connected with the new building in New York has been the construction of a safe deposit vault which should baffle the ingenuity of the American cracksman or tunneller. Amongst other considerations which have had to be taken into account in the construction of the New York Stock Exchange is the climate. Our weather may be eccentric, but such extremes of summer heat and winter cold as New York experiences are unknown here. The winter cold might render the new Exchange an untenable position, having regard to the extraordinary amplitude of its window space, were it not for the special heating arrangements, by means of which warmth will be distributed by steam radiators. Certain mechanical novelties which have been adopted for the sake of convenience and labour-saving seem to be very ingenious. The great windows in the boardroom, for example, will be automatically cleaned, and blinds have been specially invented which can be drawn backward and forward simply by touching electric buttons. In the boardroom there is a "bulletin board" having 1,200 squares, each of which can be rented by a member, who pays for the use of it. The object of the bulletin board is to indicate to each renting member when he is wanted at his office or to meet a visitor in some part of the Stock Exchange building. The specific purpose of the "wanted" notice is shown by an electric lamp illumination of a particular colour of the member's number, which is inscribed in opaque glass. As there are no fewer than five hundred telephones in the New York Stock Exchange, the provision of telephonic facilities has been a very important consideration in the planning of the new building. The great piers have been turned to account in this respect. Despite the large amount of space which the piers take up on the floor, they are turned to such good purpose by the system of encircling telephones that an actual saving of space has been effected, for more telephones have been designed in these positions than would have been possible had the piers been replaced by a simple running wall only thick enough to support the end of the building. The excitement on 'Change during panic periods or following the announcement of great failures has been taken into account in the planning of the building. The boardroom, therefore, has not been located so high as the second storey—which had originally been contemplated—the idea being that in the rush to elevators or stairways in times of great excitement dangerous consequences might ensue. In the basement are hat- and cloak-rooms, a barber's shop, baths, private-rooms, locker-rooms and toilet-rooms. Special accommodation is also provided for the employees, so that, except for business purposes, they need not mingle with the members. Glass has been most extensively used in the new Stock Exchange.



GIGGLESWICK SCHOOL CHAPEL, SETTLE. T. G. JACKSON, R.A., ARCHITECT.

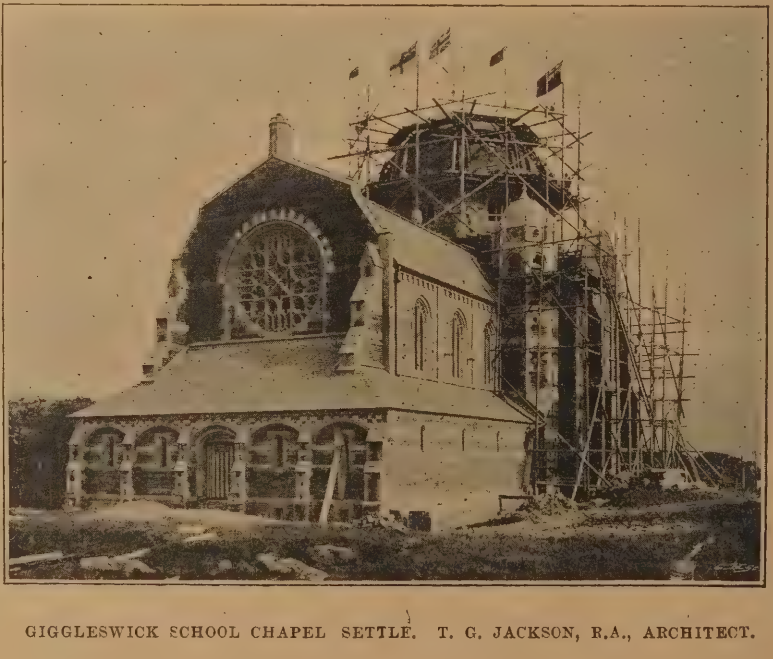
GIGGLESWICK SCHOOL CHAPEL.

ON page 546 of our issue for August 14th last we published some particulars of the new school chapel now being erected at Giggleswick, Settle, from the designs of Mr. T. G. Jackson, R.A. We are now able to give some illustrations of the building, especially of the dome, which has been ingeniously constructed by Messrs. Pulham & Son, of 50, Finsbury Square, E.C., under the direction of the architect and of Mr. Evans, the able clerk of works. The dome has an internal diameter of about 27ft., and is constructed with Messrs. Pulham & Son's patent hard hollow terra-cotta hook-tie blocks, springing from the broad and substantial stone cornice which forms the base or bed. These blocks are raised in courses of 1ft. all round, one course at a time, and well-bedded and connected with cement, the blocks being interlocking and starting in size 2ft. by 1ft. by 6in. wide on bed, then radiating towards the centre and becoming shorter as they rise. They are backed up by a good strong cement-concrete, starting at 15in. thick, well connected and amalgamated with the face blocks, by running the concrete well into the hollow chambers of the terra-cotta courses. The whole is worked up simply by a movable rod and trammel giving the radius and curve from a centre-pivot rod rigidly fixed, the movable rod being shortened to the required length as the size diminishes upwards (see accompanying illustration); the concrete backing follows and breaks joint, the last or apex ring forming the keystone, leaving an opening of 5ft. diameter, on which is fixed the stone lantern weighing several tons, the whole forming an absolutely fireproof monolithic dome. In this way domes of any size can be constructed with perfect safety, provided the foundation and abutment are ample, as in this case, in which the whole building is erected on the rock of the hill on which it stands. The system of construction is not now visible, the soffit of the dome being covered with the mosaic, and the exterior being converted into octagonal plan by brick and cement ribs and stone corbels, carried up in the concrete, backing upon which is fixed the woodwork to give the outer entasis, and to which (in this case) the copper covering is secured. Thus the dome may be constructed without iron and without cumbrous wood or other centering.

Views & Reviews.

Designing Ironwork.

Prof. Henry Adams has recently published a collection of notes, formulæ, calculations and working drawings for built-up steel stanchions as the second part of a series on designing ironwork. The first part of the series was published some time ago and dealt with a steel box-girder. Compilations like these by such an acknowledged authority as Prof. Adams are of considerable value. The study of built-up stanchions is of the greatest importance in the modern system of steel framework construction. In this little book of fifty-one pages Prof. Adams, although he sets out with the intention of designing (as an example) a built-up detached steel stanchion 30ft. high to carry a dead load of 60 tons, happily extends his notes with much information about stanchions in general, strength of iron and steel, foundations, paint for iron, cost of work and fireproof casing. He raises an interesting point when he says: "In the designing of a stanchion, strut, or compression member a difficulty arises which does not occur in designing other parts of structures. We cannot by a single calculation proportion the sectional area to the load by taking a factor of safety upon the ultimate strength; generally the length and load are settled, leaving both the diameter and sectional area to be determined together with the form of cross-section, which latter, again, largely depends upon the relation of the diameter to the sectional area. The difficulty is greater in proportion as the length is increased and the load reduced, but it exists more or less in all cases. We are in this dilemma—that we cannot tell what will be the safe intensity of stress or working load per square inch on the stanchion until we know the ratio of length to diameter, while the diameter depends upon the sectional area requisite to provide for the safe intensity of stress. . . . In the ordinary routine of designing it is a case of 'trial and error,' each trial coming nearer the truth. We can, however, expedite the process by using an approximate formula for safe load per square inch on an assumed diameter until we get near the probable dimensions." The "trial and error" method is most common in engineering practice, though this is considered by the ordinary public to be an exact science. Of course the principles of engineering are those of mechanics, mathematics, physics and chemistry—exact sciences themselves—but in practice it is found not to be expedient to always adopt the theoretical and perfect method, or there may be a want of accurate knowledge in some direction which necessitates that things should be guessed at. Thus the theoretically best section is generally not obtainable commercially, no machines being laid down by the makers to roll it, or else an easy method of making the perfect form has yet to be invented, or more material may be put in than is required because it is easier to make it thus. In this manner engineering is allied to architecture, both being in a sense one and the same, but in the latter of course there come in more unknown quantities than in engineering. Prof. Adams says: "As the hollow cylindrical column is the most economical manner of using cast-iron for supporting high loads so in the built-up stanchions the least material for a given strength will be needed when it is disposed as far as possible from the axis, but on the other hand the demands of modern building construction necessitate the cross-section being kept as compact as possible, and it is therefore a question of holding the balance between these conflicting requirements. Again, the built-up stanchion will be stronger when the circumferential portions are attached to each other to approach



GIGGLESWICK SCHOOL CHAPEL SETTLE. T. G. JACKSON, R.A., ARCHITECT.

the form of the hollow cylindrical column, but this cannot be done in stanchions of small diameter, all that can be done is to connect the various pieces sufficiently by riveting to prevent any possible movement under strain." Mr. Adams discusses Gordon's, Euler's, Johnson's, Merriman's, Rankine's, and other strut formulæ in a very clear manner and draws conclusions as to the best to adopt. The safe loads on foundations are dealt with—a subject too often neglected—and the effects of loads not being axial, of side thrust on stanchions, and of foundations not central, are noted. The question of fireproof casing is a vexed one, and we do not propose to discuss it here, but it is obvious that the iron should be left exposed wherever there is little or no risk of fire, for the logical course is surely to save labour as much as possible and not to hide up the strongest part of the construction, which, if exposed, will give that sense of fitness and strength required to satisfy the eye. Painting ironwork is another objectionable necessity that, it is to be hoped, will shortly be done away with. Of course iron can now be protected by black oxide of iron, but this is not easy or cheap; the alteration of the atomic structure of the outer coating of the iron or the addition of an alloy that will make it resist the atmosphere is the goal to strive for. At the end of this book an American standard specification of structural steel for buildings is included. We would suggest to the author that in the next edition it would be advantageous if the illustrations were printed on a little larger paper, so that when opened they lie clear of the book, as it is distressing when reading a closely argued technical description to have to keep turning back the leaves to look at the illustration. The book is, however, an extremely useful one and should meet with wide appreciation, as far too little is known by the architectural profession about constructional metalwork, in which Prof. Adams is one of the few capable specialists.

"Designing Ironwork. Second Series: Part II.—Notes, formulæ, calculations and working drawings for built-up steel stanchions." By Henry Adams, M.I.C.E., M.I.M.E., F.S.I., Professor of Engineering at the City of London College. Price 2s. 6d. Published by the author at 60, Queen Victoria Street, London, E.C.

THE ENGINEERING CONGRESS.

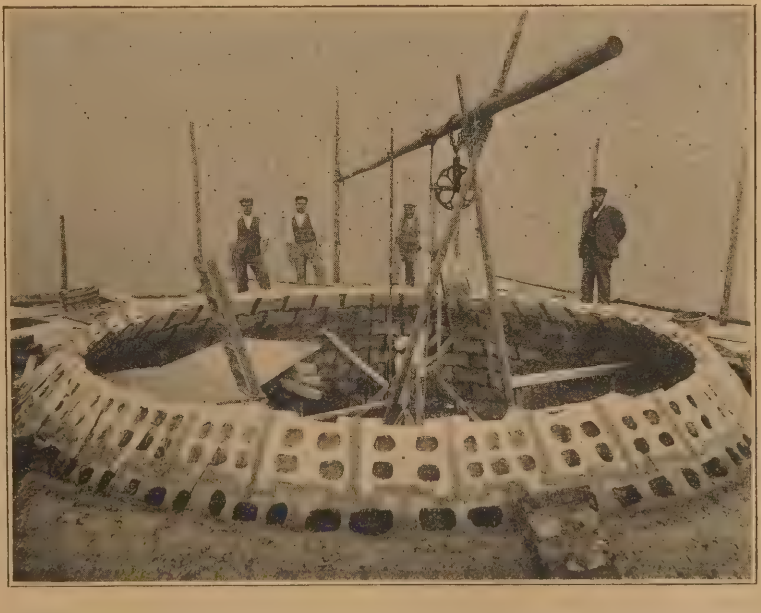
THE International Engineering Congress assembled last week at Glasgow. The honorary president of the Congress was Lord Kelvin, the acting president being Mr. James Mansergh, president of the Institution of Civil Engineers. Mr. J. D. Cormack was general secretary. The Congress was divided into no fewer than nine sections, as follow:—(1) Railways—chairman, Sir Benjamin Baker; (2) Waterways and Maritime Works—chairman, Sir John Wolfe-Barry; (3) Mechanical—chairman, Mr. W. H. Maw, president of the Institution of Mechanical Engineers; (4) Naval Architecture and Marine Engineering—chairman, the Earl of Glasgow, president of the Institution of Naval Architects; (5) Iron and Steel—chairman, Mr. William Whitwell, president of the Iron and Steel Institute; (6) Mining—chairman, Mr. James S. Dixon, president of the Mining Institute of Scotland; (7) Municipal—chairman, Mr. E. George Mawbey, president of the Incorporated Association of Municipal and County Engineers; (8) Gas—chairman, Mr. George Livesey; (9) Electrical—chairman, Mr. W. E. Langdon.

At the opening on Tuesday Mr. Mansergh delivered a short address, in which he said that engineers constituted more than a profession; they amounted to a "race"; and it was upon them more than upon any other class of the civil population of the world that fell the heaviest share of the "white man's burden." The quality of the engineer seemed to lean more to the side of invention than to that of scholarship. For his part he was content to have it so. Not that an engineer could ever be too deeply instructed or too well trained in the elements of knowledge and skill required for the effective pursuit of his calling; but the really great engineer was born, not made. Engineering was the only high art which depended as much on its cheapness for its excellence as upon any other item in the sum of achievement. All other things being equal—adaptability, soundness, efficiency—the engineering work which costs the least money was the best. The "cash" basis was the real foundation upon which the engineer builds, and this consideration drew them at once from judging engineering as merely something cleverly done by an ingenious person. It also very often served to distinguish between college, text-book, or rule-of-thumb engineering and the real thing. A good deal of wasted ingenuity would be saved if those who engaged in every kind of engineering work would remember to use the money standard as well as the foot-rule and the higher mathematics. Real engineering must be mastered as it was realised on works in progress. It had no authoritative text-book. Like the perfect artist described by Longfellow, the engineer must learn to work with the means that lay readiest to his hand. He must cherish his ideals or he would sink into the routineer; but he, of all men, could not afford to indulge in hobby-riding. The distinguishing note of modern engineering was that it subserved in the main the interests of the mass of the people.

VIEW OF INTERIOR OF DOME, GIGGLESWICK SCHOOL CHAPEL, SETTLE.

From the many papers read in the various sections, we may select the following:—

In the Municipal section Lieut.-Col. Alfred S. Jones, C.E., V.C., read a paper on "Practice with Science in the treatment of Sewage." He insisted upon good arrangements for dealing with sludge and screenings. Barging to the sea or pressing with lime into a portable cake of little or no manurial value were sometimes resorted to for sludge, and a destructor fire, he said, was best for screened rags and other débris. Mr. William Weaver, borough engineer and surveyor, Kensington, in submitting a paper on "Municipal Sanitation" said wherever practicable the surface water should be received into a separate system of sewers in order to divert the water from the sewage outfall. In ventilating sewers simple methods were preferable to complicated and costly systems of combustion or chemical aëration. If sewers and drains were treated as component parts of one system, and each drain made to assist in getting rid of the smell it helped to create, road-surface ventilators would not be necessary, and the costly comparative merits of the various patent systems for dealing with sewer air would no longer require attention. House-drainage, as far as was consistent with efficiency, should be made as simple as possible. On the subject of habitations and their occupants Mr. Weaver said that the increased cost of building principally arose from the modern trade union policy of limitation of output governing all the material and trades connected with the structure. The result was thus brought about that by the curtailment of their efforts workmen were making their handiwork too expensive for their own enjoyment. One of the great defects in sanitary administration



THE CONSTRUCTION OF THE DOME, GIGGLESWICK SCHOOL CHAPEL, SETTLE.

arose from inability to enforce cleanly and sanitary habits on the occupier. Sanitary nuisances, whether arising from man or matter, should be dealt with, and the present limitation of sanitary effort to matter only should be revised. No nuisance should be allowed to stalk about in freedom and multiply broadcast because it happened to be in human form. Mr. A. H. Campbell, engineer and surveyor of the East Ham Council, in a paper on "The Housing of the Working Classes, with Special Reference to Suburban Districts," described the scheme of the East Ham Council for providing within their district dwellings of suitable class and at a suitable rental for the lowest class of wage-earners, whose earnings were at maximum 30s. a week. The scheme of the council was to provide four-roomed and five-roomed houses of from 470 to 520 super. ft. on the ground- and first-floors respectively at rentals of 5s. 9d. and 6s. 3d. per week inclusive. It had been found at the East Ham dwellings that for each 100ft. of available floor-space in rooms a rental of from 1s. 4d. to 1s. 7d. per week was required.

In the Iron and Steel section Mr. J. E. Stead gave the results of investigations upon alloys of copper and iron. He observed, amongst other things, that copper in cast iron does not appear to have any influence in retaining the carbon in the combined form or in causing a separation of graphite, and that copper in foundry iron neared not be feared, as its only effect appears to be that of raising its tenacity. A paper was also contributed by Mr. J. E. Stead and Mr. F. H. Wigham, who stated that, although their researches were far from conclusive, they led them to conclude that copper in high carbon steel for wire-drawing purposes should be avoided.

In the Mechanical section Mr. R. Lenke read a paper on "Some Experiences and Results Derived from the Use of highly superheated Steam in Engines." He said the steam engine in its highest perfection attainable at present could not claim the first place in comparison with other heat engines. Superheated steam was a very bad conductor of heat, and had the special peculiarity of being able to lose a certain amount of heat without becoming either saturated or wet steam. The economy effected by using superheated steam in engines was very remarkable. To obtain the full benefit, the required temperature of steam was 660degs. to 700degs. F., and to stand this temperature the engines must be specially designed.

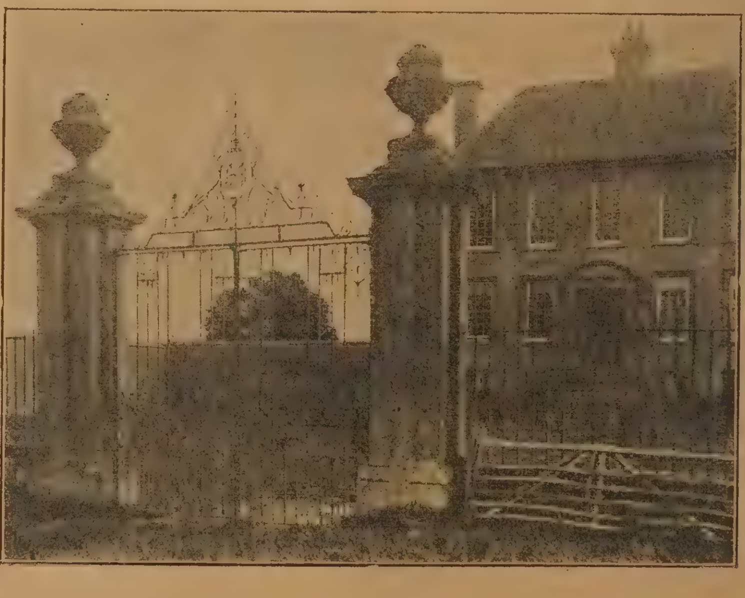
The Old Church of St. Peter Mancroft, Norwich, is again in need of reparation. Despite the large sums which have been spent on it during recent years, the north and south walls and porches are said to be in such a state of decay that large masses of masonry have fallen out, while the east end is also in need of renovation. So serious are the dilapidations that it is estimated that some £4,000 will be required to put the building in proper repair. At present, however, it is only contemplated to spend about £500 on the works most urgently needed.

LOWER LYPIATT.

BY GEORGE TROTMAN.

LOWER LYPIATT is a fine old house—now alas! fast falling into decay—situated about four miles from Stroud, and overlooking one of the numerous delightful valleys in that neighbourhood. There is a record, I believe, of a mansion being there in the reign of Queen Elizabeth, but becoming ruinous it was rebuilt at the end of the seventeenth century by one Judge Charles Coxe, member of Parliament for the borough of Cirencester. From what remains of the entrance gates it is seen that at one time they must have been very fine. They are said to have been designed and executed by a reprieved sheep-stealer out of gratitude to the judge who obtained his reprieve—at least this is the story. The gardens appear to have been laid out with good taste, and covered the slope into the valley below. On this slope is a monument erected to the memory of a favourite horse. The tablet with inscription has been lost.

LOWER LYPIATT, NEAR STROUD.



LOWER LYPIATT, NEAR STROUD: ENTRANCE GATES.

St. Barnabas Church, Burnmoor, is to have a new altar as a memorial to Queen Victoria. The memorial altar is of carved oak, with three panels in front, the centre bearing a floriated cross, and the ornamentation includes the customary emblems of corn and grapes. It is proposed to leave the panels uncovered, but super-frontals in the colours of the ecclesiastical seasons will be provided, and are being worked at the school of embroidery in connection with Canon Body's Society of Workers at Durham.

SOME IRISH BRICKWORKS.

THE manufacture of bricks and tiles in Ireland has been in a fairly flourishing condition, though not nearly so flourishing as might reasonably be expected; but as regards pottery the industry has not yet attained anything like anticipations.

One of the largest—if not the largest—firm in Ireland utilising the red clay for terra-cotta work and facing bricks is

The Annadale Brick Co., of Belfast,

whose works are situated about a mile and a half outside the city, at the end of the Ormeau road. These works stand in about fifty acres of clay soil owned by the company, the portion not immediately occupied by the works, kilns, sheds, &c., being farmed to supply goods for the company's horses. The kiln is a circular one of the "Hoffman" type and has twenty-four chambers with a holding capacity of 500,000 bricks. The works are contiguous to the kiln, and comprise two floors of machinery and drying-rooms. The ground floor is devoted to brick-making. One section of the brick department contains a Wooton's improved pug (with three sets of rollers) having a capacity of 25,000 to 30,000 bricks a day, as well as another machine of similar capacity. A different section of the works is employed turning out pressed facing bricks, and in this case the clay is washed first and then put through machinery. The drying sheds are heated by steam and run the whole length of the building. The works can turn out 50,000 to 60,000 bricks daily. The pottery and terra-cotta department has the end of the building to itself; and this branch of manufacture, though only started a few years, has now developed into a very large business. The Annadale Brick Co. was the first firm to introduce terra-cotta and ornamental bricks into Belfast. The works are continually being extended. Originally the company's trade was chiefly confined to Belfast and the Northern counties; but now the firm send bricks all over Ireland, and are cultivating an export trade, particularly in terra-cotta.

The Works of the Skeigoniel Brick Co., Ltd.,

are situated at Skeigoniel, on the outskirts of Belfast, and cover an area of ten acres of land. The company is a private one, the shares being held by the families of Sir Daniel Dixon (Lord Mayor of Belfast) and of Mr. James Campbell. They manufacture only compressed bricks, which are well known throughout the North of Ireland. The works have an output of from 7,000,000 to 9,000,000 bricks per annum.

Other Brickworks around Belfast.

Messrs. S. M'Gladery & Son, brick and tile manufacturers, Springfield Road, Belfast, are makers of common machine-made bricks. The brick-making industry in Belfast has been seriously affected by the depression in the building trade. About five years ago this firm had five brick machines at work, employing 250 workmen, and were capable of turning out over 100,000 bricks per day, but at present they do not employ more than one-fourth of the number of men mentioned.

The brickworks situated at Brookmount, near Lisburn, were established by James Simpson in 1893. The grounds consist of a bed of pure red clay about 12ft. thick just below the soil, free from stones and very rich; also a hill of red sandstone 20ft. thick above the level of the surrounding country. This sandstone is ground in a revolving 9ft. dry pan, and thoroughly mixed with the clay in proper proportions, thus making a hard sound cherry-red brick free from cracks. There is a first-class stock brick made here, and also facing bricks, pressed, perforated or shaped. Very few tiles are made, there being no demand for them in that neighbourhood. The bricks are dried on benches in summer, covered with ordinary thatched hacks. Bars are used in the furnaces, best Scotch coal being used for firing. It takes six days to water, smoke and burn, twelve hours to settle, and twenty-four hours to cool off. The trade at present is unfortunately very dull in the neighbourhood.

The Kingscourt Brick and Terra-Cotta Works, which are situated at Kingscourt, in the co. Cavan, supply all the War Office contracts in Ireland with facing bricks, coping, ridge tiles and ventilators. They supply Portobello Barracks, Island Bridge Barracks, the Royal Barracks, the Richmond Barracks and Arbour Hill Barracks, and the articles manufactured there are also sent on to Athlone, Mullingar and elsewhere. The works have been in existence for about twenty-five years. Formerly bricks only were manufactured at the works. Recently the manufacture of ornamental terra-cotta, ridge tiles, &c., has been added, and the manufacture of blue bricks is about to be started. This is the first experiment made in Ireland in the production of blue bricks, which take twice as long to burn as the ordinary brick. From sixty to seventy men are permanently employed at the Kingscourt works, almost all of them being local hands.

In the south there are a number of important firms doing a good trade in the manufacture of bricks and tiles. They include Richard Farrell, of Youghal; the Youghal Brick Co., Ltd., of Youghal; the Cork Brick Manufacturing Co., Ltd.; the Charleville Brick and Tile Co., Charleville; William Carroll, Cork (brickworks at Douglas); and John Barry, Cork.

The brick factory of the Waterford Brick Co., at Waterford, has been at work for about two years. The bricks are made of crushed stone, in the semi-plastic process, and are burnt in a patent Belgian continuous kiln of twenty-four chambers. The weekly output is between 40,000 and 50,000, and the demand is so great that the bricks are sometimes taken hot from the kiln and loaded on cars.

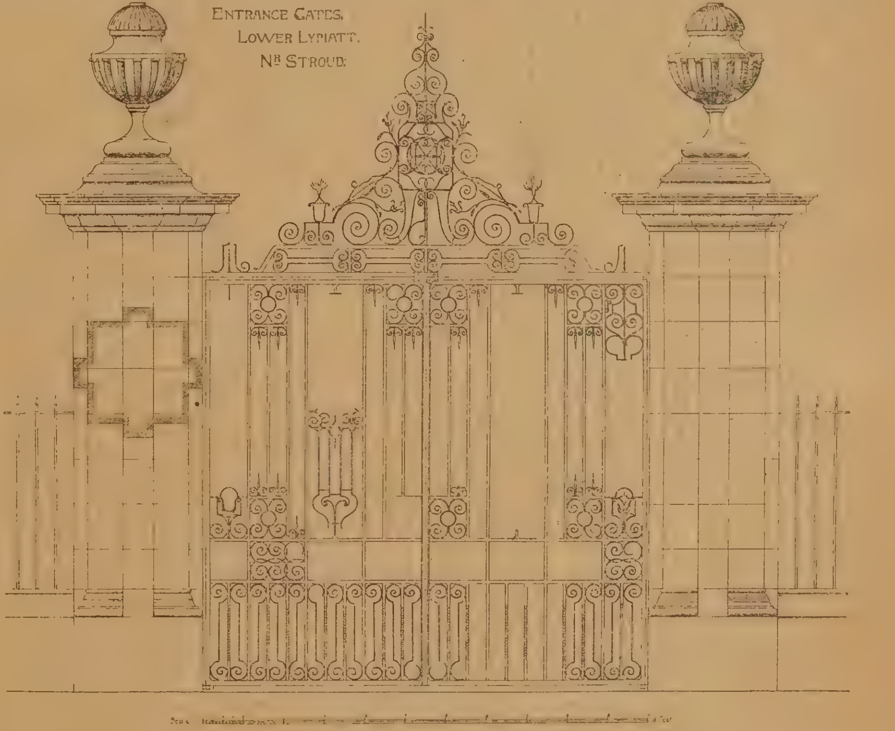
In the vicinity of Dublin there are a few manufacturing firms doing a large business, and Messrs. Flood are brick and lime manufacturers in Clondalkin. The Dublin Brick and Tile Co., Ltd., have their extensive works at Mount Argus, Harold's Cross, and their office is in Beresford Place. Owing to the stony nature of the clay from which the bricks are manufactured, it is necessary to wash it to produce a good brick, and to this may be attributed the large demand there always is for the company's goods, the output amounting to over six million bricks per annum. All the machinery, kilns, &c., have been specially designed by their manager to suit the material from which they manufacture. The waste heat from kilns, &c., and the exhaust steam from the engines are utilised for drying the green bricks, which are made on the plastic wire-cut system. The company have a black stone quarry in operation. The stone is largely used for building and other purposes, and they supplement their washed clay by dry grinding a shale that lies between the beds of stone. The company employs about 100 hands.

On the Crumlin Road, Crumlin, are situated the works of the Dolphin's Barn Brick and Tile Co., Ltd.

At the Belvelly Brick and Tile Works, Fota Island, Queenstown, which, we understand, are kept going by the Right Hon. A. H. Smith-Barry, M.P., for the laudable purpose of employing local labour, the annual output of bricks is 800,000, of which 100,000 are pressed facing bricks and 700,000 ordinary building bricks, a quantity of flooring tiles being also produced to meet the demand. There is a working staff of twenty-two men, with horses when required. The annual outlay on labour, &c., amounts to £900. Owing to slackness of trade there is at present a large quantity of bricks in stock. As no profits are sought, quotations are given at cost prices. The plant consists of one 8-h.p. semi-portable engine, one pair of rollers for crushing clay, one vertical mill and side delivery cutting-table, and a six-chamber baker kiln to contain 100,000 bricks.—(Extracts from an article in the "Irish Independent.")

NEW BATHS AT OLDHAM.

NEW baths situated at Robin Hill, on the north side of the town, were formerly opened at Oldham last week, the cost being £10,000. Similar baths will shortly be opened at Rathershaw, on the south side of the borough, and in addition another such building is in course of erection in Glodwick. The Robin Hill Baths are erected at the corner of Dunbar and Trafalgar Streets, and are set back from the street with boundary walls and ornamental gate and railing in front. Separate entrance is arranged for each bath from Dunbar Street, with ticket office within, and near the respective entrances are two waiting-rooms, one for each sex. The swimming hall is 94ft. by 47ft. 6in., the swimming pond 75ft. by 27ft., 6ft. 6in. deep at one end and 3ft. 6in. at the other, there being arranged round three sides fifty-seven dressing-boxes, the divisions between them being of polished marble. There are two wash-baths, also showers for bathers to use before entering the pond. The sides of the pond are faced with white glazed bricks up to the water-line; from this point to underside of coping is an effective treatment of tiling in pale green and cream, the bottom being tiled with white tiles relieved with bands of black. A balcony is carried round the four sides of the hall, with gentlemen's private baths arranged down two sides, one side containing thirteen first-class baths (including one vapour-bath), the other twelve second-class baths. The ladies' private baths are on the first floor over the ticket office, waiting-rooms, &c., there being four first-class (including one vapour bath) and seven second-class, also attendant's store-room. All first-class baths throughout have showers. The supply of hot and cold water to all private baths is regulated by means of valves worked by the attendant from corridors. A laundry, superintendent's house, mechanic's shop, store-rooms and spacious cellars are also provided. The whole of the work has been carried out from the designs and under the superintendence of Mr. Charles T. Taylor, A.R.I.B.A., architect, of 10, Clegg Street, Oldham.



MEASURED AND DRAWN BY GEORGE TROTMAN.

New Patents.

These patents are open to opposition until October 14th.

1900.—Cement Manufacture.—14,278. Dr. HERMANN PASSOW, 11, Posthof, Hamburg. The raw material (ground or rough) is melted down till a liquid homogeneous mass is formed. Oxygen (or air or gas containing oxygen) is then brought into intimate contact with it, so that a cement clinker is obtained. It is claimed that the quantity of air or oxygen can be regulated, and that blast-furnace cinders can be changed, without further chemical additions, into cement equal in all respects to the best Portland cement.

Timber Waggons.—15,769. J. A. HOLDSWORTH, 37, Park Avenue; F. C. MIDGLEY, 47, Louis Street; and J. HOLDSWORTH, 27, John Street—all of Hull. The body of the vehicle is wedge-shaped, the front forming the apex. The load is placed on a tail-board gate, and when this is lowered the timber is discharged with ease.

The following specifications were published on Saturday last, and are open to opposition until October 21st. The name in italic is that of the communicator of the invention. A summary of the more important of them will be given next week.

1900.—14,411, JONES, ball valve. 14,496, COOK, guards for woodworking machines. 14,526 ALDEN, sliding doors, sashes, &c. 15,186, BROPHY, apparatus for supplying hot and cold water in bathrooms, &c. 16,037, ADAMS, apparatus for spraying sewage upon a filter bed. 17,086, DEUTSCH, cranes or hoists. 17,374, BOND, trap for drains, sewers, &c. 17,477, TENOW & FLODSTRÖM, lumber-piling machines. 17,866, ELIET, construction of floors, girders, joists, &c., from trussed beton. 17,867, ELIET, construction of flooring, walls, partitions, &c., of trussed beton. 18,213, HERMAN, street manhole covers. 18,443, SHIMER, cutter heads for woodworking machinery. 18,565, THOMSON, regulating the supply of hot and cold water to baths, &c. 19,392, MÜLLER, manufacture of cement.

1901.—4,688, MALLETT, cowls. 5,433, LINDEMANN, trucks for transporting bricks. 9,184, WEISS, parallel-motion valve-regulator for ventilating apertures, heating flues, &c. 11,927, LAKE (*Giussani*), preservation of wood. 12,745, WOODHOUSE, syphon flushing cisterns. 13,237, NEUHAUS, manufacture of cement pipes with imbedded iron meshwork.

Enquiries Answered.

The services of a large staff of experts are a the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases le addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Strength of Cast-Iron Stanchion.

NORTHAMPTON.—BRUIN writes: "I should be glad if Prof. Henry Adams would state a formula for ascertaining the strength of cast-iron stanchions of H and ⊢H sections. I have consulted several authorities without success. The particular case I have in mind is one where a stanchion of ⊢H section 10ft. 6in. long, to carry 25 tons, is needed. I want to ascertain its sectional area. It will be used in an old building which is about to be turned into shops?"

Full particulars of designing cast-iron stanchions are given at p. 138 of "The Practical Designing of Structural Ironwork" (E. & F. N. Spon, 125, Strand; 8s. 6d.). A 7 by 7 by ¾ I stanchion of cast-iron 10ft. 6in. long will carry 25 tons safely. By Gordon's formula:—

$$W = \frac{f\,A}{1 + \frac{3}{400}\left(\frac{l}{d}\right)^2}$$

where W = breaking weight in tons; f = compressive strength in sq. in.; A = area of section in sq. in.; l = length in inches; d = least breadth in inches.

For 7 by 7 by ¾, A = 14¾ sq. in.; f for cast-iron = 36; l for given case = 10½ × 12 = 126in.; d for proposed section = 7in.

$$\text{Then}\quad \frac{36 + 14\frac{3}{4}}{1 + \frac{3}{400}\left(\frac{10\frac{1}{4} \times 12}{7}\right)^2} = 154{\cdot}8 \text{ tons};$$

and with factor of safety 6, $\frac{154{\cdot}8}{6} = 25{\cdot}8$ tons safe load.

HENRY ADAMS.

Makers of Artificial Stones and Concrete Pavings.

BRADFORD.—W. H. & Co. write: "Kindly give the names of artificial pavement makers, concrete flags, &c."

You will find the names of many makers of artificial stones and concrete pavings in Laxton's "Price-Book for Architects, Builders, Engineers and Contractors." The following are some of them: Metallic Paving and Artificial Stone Co., Ltd., 86, Strand, W.C.; Patent Victoria Stone Co., Ltd., 10-13, Hamilton House, Bishopsgate Street Without, E.C.; W. B. Wilkinson & Co., Ltd., 15, Great George Street, Westminster; Stuart's Patent Granolithic Stone Co., Ltd., Regent's Dock, Limehouse, E.; Hobman & Co., Stockholm Road, Cliftonville, South Bermondsey, S.E.; Patent Indurated Stone Co., Ltd., Millwall, E.; B. Ward & Co., 15, Great George Street, Westminster.

Reed Thatchers.

LYTHAM.—E. C. P. writes: "I am about to build some small portable wooden bungalows, and I purpose covering the roof with Norfolk reed thatching. At present, however, I have been unable to obtain the names of any persons who would undertake this work. Could you name anyone?"

It is becoming increasingly difficult to get thatching executed, even in the districts where a few years ago its use was almost universal. Possibly an advertisement in a local paper would procure what you need. Try the "Dereham Times" (address, East Dereham, Norfolk) or the "Norfolk Chronicle" (address, Norwich). Should this be unsuccessful I would suggest the "Cambridgeshire Times" (address, March, Cambs.) or the "Huntingdon Advertiser" (address, March). All the above are weekly papers.

G. S. M.

Stress Diagram for Roof Truss.

BRIGHTON.—D. writes: "I send a diagram of a roof for a small hall. What would be the reciprocal diagram? The dead loads on one side are figured with the total weight on walls."

The span of roof is not given, but it is assumed to be about 27ft. The exact stresses would be rather troublesome to work out, but the case may be very much simplified and approximate stresses obtained by taking a vertical load of 56lb. per ft. super., to include wind, snow, structural load, &c., and assuming the frame diagram to be as in Fig. 2, when the stress diagram will be as Fig. 3.

HENRY ADAMS.

STRESS DIAGRAM

DIAGRAMS FOR ROOF TRUSS.

Taking-Off Quantities from Plans.

STAFFS.—G. H. writes: Which is the best and most correct way of taking-off quantities from plans of roof-timbers, especially where the roof has many hips, valleys, dormers, &c.?"

This query is of rather too comprehensive a nature, and is not sufficiently defined, to enable us to reply within the limits of these columns. If "G. H." will mention an instance showing where he is in difficulty, we will endeavour to help him; or he will find examples to help him in the various works on the subject. As an elementary work we would refer him to "Quantities and Quantity-Taking," by W. E. Davis, price 3s. 6d.

Erecting a Casting Shop.

BLOXWICH.—W. W. writes: "Kindly name a book dealing with the construction of furnaces and stacks in casting shops. I have to provide a plan for a casting shop with six furnaces, all the flues to run into one stack. I may say that I have not had any experience of this kind of work before."

We do not know of a book dealing particularly with the planning and construction of casting shops. We can only advise you to consult recent books and papers dealing with the latest practice in moulding and founding, and make your design conform with the necessary requirements. Get full particulars from your clients of their particular workshop methods. The following books contain much useful information on the subject: "The Metallurgy of Iron," by Thomas Turner (Griffin & Co.); "The Metallurgy of Steel," by F. W. Harbord (Griffin & Co.); "Iron and Steel Manufacture," by Arthur H. Hiorns (Macmillan & Co.); "The Management of Steel," by George Ede (E. & F. N. Spon, Ltd.); "Pipe Founding," by James W. Macfarlane (E. & F. N. Spon, Ltd.); "A Treatise on Iron and Steel Founding," by Claude Wylie (E. & F. N. Spon, Ltd.); "Brass Founding," by James Larkin (E. & F. N. Spon, Ltd.). Perhaps the most useful books are "A Practical Treatise on Casting and Founding, including descriptions of the Modern Machinery employed in the Art," by R. E. Spretson; and "The Metallurgy of Cast Iron, being a complete exposition of the processes involved in its Treatment, from the Blast Furnace through the Foundry to the Testing Machine," by Thomas D. West (12s. 6d.). These are both published by E. & F. N. Spon, Ltd., of 125, Strand, W.C. For the latest practice in founding see the Proceedings of the Iron and Steel Institute.

Architects in India.

LONDON, W.—BEGINNER writes: "Is a clerk likely to gain employment in India as an architect, and is the salary good?"

We think anyone might have refrained from asking us such a ridiculous question as this. By "clerk" we presume our correspondent means clerk of works. India is as well supplied with architects as this country, except perhaps its European ones are not so capable as those here; the native architects, however, are very skilful, and build in the most suitable way. The constructional work that is mostly done in India is in the hands of engineers, and a clerk of works there would have less chance of obtaining a remunerative practice quickly than in this country.

The Planning of Hotels.

DRAUGHTSMAN writes: "Can you name a book giving information about the planning and construction of hotels?"

We know of no book dealing exclusively with this subject. Mr. Percy L. Mark's "Principles of Planning" gives a list of the requirements and plans of an hotel.

Openings for Architects in Japan.

BURNLEY.—G. A. B. writes: "Are there Government or society examinations in surveying, levelling, &c.? Also are there openings in Japan for architects or surveyors, and where can I obtain particulars?"

Government examinations are held for assistant surveyors in the Civil Service. The Surveyors' Institution holds examinations in surveying, and particulars can be obtained from the secretary, Surveyors' Institution, Great George Street Westminster, S.W. Japan has plenty of native architects, but we believe several American architects have taken advantage of the craving for European civilisation and have good practices among the wealthy classes there; but the boom may be only an ephemeral one. Civil engineers are, however, likely to find plenty of scope there, as the country is rapidly being opened up in this direction. Particulars can be obtained from the Japanese Embassy in London.

A Sketching Tour.

LONDON, S.E.—LEAD LIGHTS writes: "I propose to go for a week's sketching tour in preparation for the R.I.B.A. final examination. Please suggest a good district. Could I do better than the Eastern counties?"

See replies to enquiries under heading "Sketching Tour round East Coast" on p. 484 of our issue for July 24th last, and "English Tour for Architectural Student" on p. 105 of our issue for March 13th last.

Taking-off Quantities of Stone Sill.

Beeston.—Notts writes: "Kindly explain the method of taking off the quantities of a stone window sill as per enclosed sketch (not reproduced). The method I refer to is the one by which the stone and labour are taken separately."

The centre sill being shown sunk at the back, causes this stone to be 2in. wider than the section; hence:

R.I.B.A. Testimonies of Study.

Glasgow.—A Constant Reader writes: "I am drawing out my testimonies of study for the R.I.B.A. Intermediate Examination. In drawing the Classic ornament, sheet No. 3, would a capital of an antæ taken from the Erechtheium at Athens be sufficient; also, in sheet No. 6, would an Early English spandrel which is a typical example of the style be sufficient? Can both be drawn in pencil?"

The examples you mention are sufficient and can be drawn in any medium you like—ink, pencil or silverpoint—so long as they are in outline.

R.I.B.A. Glasgow Examinations.

Glasgow.—G. S. writes: "Is there any likelihood of the R.I.B.A. examinations being held in Glasgow next November?"

We are informed that if there are sufficient candidates from Scotland an examination may probably be held in Glasgow.

Recovery for Loss caused by Sewer.

London, S.W.—M. M. B. writes: "A friend of mine owns a couple of meadows in a parish in West Surrey through which the local council last year laid a 9in. pipe sewer. The sewer has since been twice taken up and relaid—once by a fresh contractor, and lastly by the council's employees—the work of the two contractors having been badly executed. As a consequence, on several occasions my friend's meadows were in part at the mercy of the council. Once he was deprived of his hay from the area occupied by the sewer, on the other occasions the hay season was over and only the pasture was damaged. (1) How much per yd. or rod super. should I charge for loss of hay? (2) How much for loss of pasture on the two later occasions of reconstruction? (3) What is a fair charge for wayleave?"

(1) The charge must depend on the local value of the hay which has been lost or damaged. The tenant or landowner should be able to give you some idea of the actual loss sustained, and on such information the claim should be based. (2) This again entirely depends on the nature and extent of the damage which has taken place; the rental value of the pasturage and other similar particulars will also assist you in arriving at a proper valuation. (3) No hard-and-fast charge can be laid down as applicable to every case of this description, and the surveyor or valuer must be guided by local circumstances. T. E. C.

Formula for Struts.

Carlisle.—Student writes: "What alteration would there be in the formula for struts given on page 43 of Hurst's 'Handbook,' where mild steel is used instead of wrought iron? Would there be any variation in the values of '*a*' on page 44? Please mention a good cheap book on steel."

Our edition is not the same as yours, but we presume you refer to the formula

$$W = \frac{16S}{1 + \frac{l^2}{ad^2}}$$

This is the same as that given for wood pillars and struts, with the exception that the crushing force of wrought iron in tons per sq. in. (namely 16) is given instead of F. With other materials use other values instead of the 16, that for mild steel being 80 for cast and 50 for puddled. The values of a would not vary with wrought iron other than for the various sections given. Prof. Henry Adams's book on "The Practical Designing of Structural Ironwork" (price 7s.) is to be recommended.

Erections beyond the Building Line.

Stoke-on-Trent.—P. M. writes: "The owners of building plots A and B on the enclosed plan (not reproduced) have mutually covenanted that they will not erect any main building beyond the building line shown on the plan herein drawn (*i.e.*, in the deed). Could either prevent the other from erecting one-storey or two-storey bay windows beyond the building line, or building chimney breasts so as to project 9in. or 14in. beyond the building line, the outside of main wall being within or on the building line?"

No. The use of the adjective "main" to qualify "building" is decisive. Bay windows and chimney breasts are not main buildings, but adjuncts. G. A. T. M.

Correspondence.

On the Settling of Accounts by Architects.

To the Editor of The Builders' Journal.

Sir,—There is one phase of the relations between architects and builders that might well form the subject of a discussion in your columns. Every builder is aware of the difficulty generally experienced in obtaining a settlement when a contract is completed. The architect and his client are keenly insistent on work being carried out to time; and as a rule this is done, for it is not to any builder's interest to dally with work. When settling time comes, however, the architect's interest in the job seems suddenly to have ceased; and, with rare exceptions, he has not time to square up the accounts. It is no uncommon thing for builders to have to wait six months, twelve months and even longer for a settlement. I maintain that this is a gross injustice to a body of men who have more difficulties to contend with than any other tradespeople. The remuneration of 90 per cent. of employers in the building trade is far lower than that in any other important industry and altogether out of proportion to the work and worry entailed. The slowness of return is to a great extent the cause of this, and the indifference and dilatoriness of architects is mainly responsible for it. I trust that a full expression of opinion on this subject will lead to a better understanding between architects and builders.—Yours truly,

LANCASHIRE BUILDER.

Keystones.

A New Central Fire Station at Scarborough has been erected in North Marine Road, and a district fire station in Alga Terrace, South Cliff.

Avening Church, the restoration of which is proposed, is one of the oldest church in Gloucester, or indeed in England. It still shows portions which were consecrated a year or two after the Norman Conquest.

A New United Methodist Free Church at Ilford is being erected in Ilford Lane. The new church, which will be of brick with Bath stone dressings, will comfortably seat 650 persons. Late Gothic is the style adopted, and there is to be a spire rising to a height of 75ft. from the ground.

No. 43, Gerrard Street—in which the poet Dryden died in 1700—will have to undergo alterations, even if it be not pulled down, as the front is considered in a dangerous condition. Though the upper storey of the house is plain, the staircase is fine and remains characteristic of the time of Dryden; it still retains corkscrew banisters and mahogany rail.

Cottages for the King's Labourers.—The King is having thirty or forty commodious cottages built on the Crown land at Old Windsor for labourers on the royal estate. The men have been paying 5s. and 6s. a week rent for houses owned by private persons, but the rent of the new cottages will be only 2s. 6d. a week. No lodgers are to be taken.

A Parish Institute at Stocksfield is to be erected from the plans of Mr. Balden, architect, on a site near Mount View Terrace, and within about 200 yards of Stocksfield Station. It will comprise a library 23ft. by 18ft., a billiard-room 30ft. by 23ft., a hall 63ft. by 26ft., and caretaker's quarters. The building is estimated to cost about £1,600.

Old Paris, like old London, is fast disappearing. Most visitors to the French capital have seen the quaint church of St. German-des-Prés, the oldest in Paris, but few have gone round its north side and seen the fine old houses and ancient abbey. The abbey has been so much scraped, painted and otherwise deprived of its original architectural character that it is scarcely recognisable, and it will soon be almost entirely hidden, large sheds being built in front of it. The charming old houses facing the abbey are coming down. One of these, dating from the seventeenth century, though somewhat dilapidated, was covered with ivy and was the delight of artist and amateur. Huge business premises are to be erected in its place.

A New Technical School and Free Library at Haslingden is to be erected at a cost of £6,665. The building will be situated on Bury Road.

The Chancel of Castle Donington Church is proposed to be restored. The spire of this church, tapering to a height of 180ft., is a conspicuous object in the district, and can be seen for many miles. The chancel was not included in the restoration of 1877.

St. Oswald's Church, Hebburn, is to be completed, and the foundation stone of the chancel was laid last week. The scheme, it may be mentioned, comprises the addition to the church of chancel, vestry, organ chamber and bell turret, the provision of which, it is estimated, will incur an expenditure of not less than £1,500. Messrs. Cowper & Henderson, Jarrow, are the contractors.

The North Ward of the Swansea Hospital is now undergoing extensive alterations. A new teak floor is being laid by Messrs. Arrowsmith, of New Bond Street, London; and new sanitary arrangements by Messrs. George Jennings are being fixed. It is expected that the work will be completed and opened by the beginning of next year. The whole of the work is being carried out from designs under Mr. Glendinning Moxham, architect, of Swansea.

Kensington Avenue Board Schools, East Ham, were formally opened on Saturday, August 31st, by Rev. J. H. Ware, M.A., Rural Dean, chairman of the East Ham School Board. The schools are built to accommodate 1,573 children—541 infants, 516 girls and 516 boys—at a cost of £20,522, exclusive of furniture and site. The builders are Messrs. Gregar & Son, Jupp Road, Stratford, and the architect is Mr. S. Jackson, 65, Fenchurch Street, E.C. The design for these schools was illustrated in our issue for November 14th last.

New Swimming Baths at Chester have been erected on a site in Union Street facing the Grosvenor Park by Mr. W. Freeman, builder and contractor, of Chester, at a cost of £12,000; the site cost another £1,500. The plans were prepared by Messrs. Douglas & Minshull, architects, of Chester. There are two swimming baths of considerable dimensions, and the accommodation includes a number of slipper baths.

All Saints' Mission Church, Newton Abbot, was reopened recently after renovation of the sanctuary. In addition to three new ventilators, the walls have been decorated in light tones of green and cream, new draperies and dossel by William Morris & Co., of London, have been added, as well as a new oak table executed by Mr. Hugh Mills, who also carried out the whole of the work. A new classroom has also recently been added to the school at a cost of between £300 and £400.

The Birmingham Oratory is to have additions made to it as a memorial to Cardinal Newman. These are to be of a very simple character, if they are to be in keeping with the original design. Plans have been prepared for a suitable church at an estimated cost of at least £23,000. The church, as Newman built it, was merely four brick walls, requiring no design beyond that of the local builder. Somebody has described it as having the appearance of a riding school. Yet the first idea of Newman had been very ambitious indeed. His intention was to build in miniature a sort of St. Mark's, Venice, the church he most of all admired, and there are still preserved some plans made in this spirit by M. Viollet le Duc, who was among the distinguished visitors to Newman in Birmingham.

The Old Church of St. Margaret, Palling-next-the-Sea, a small fishing village on the extreme east coast of Norfolk, is rapidly decaying and is proposed to be repaired. Among the relics of its former state and condition are a fourteenth-century font and an old oak door with the original lock and key of the same period. The remains of the chancel screen, old glazed tiles, piscinæ, and windows still speak of bygone grandeur, and will be carefully preserved, but the present needs are for structural repairs only. The architect states that an entirely new roof for the nave and the rebuilding of the chancel arch and part of the north and south walls of the nave are an absolute necessity, while new stonework is needed for the windows. About £1,700 will be needed, and there is no prospect of raising so much in the district.

The Liverpool Sanatorium for consumptive cases, in Delamere Forest is now completed.

The Additions to the Grammar School, Pontefract, are being warmed and ventilated by means of Shorland's patent Manchester grates and patent extract ventilators, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

New Offices for the Holywell Guardians are to be erected, with new receiving ward, &c., at a cost of £4,800, on a site adjoining the main workhouse building. The contractor is Mr. Richard Jones. The plans have been prepared by Messrs. J. H. Davies & Son, architects, of Chester.

Homes for Aged Miners.—The foundation stone was laid recently of the Northumberland Aged Mine Workers' Homes at East Chevington, Broomhill. The land on which the houses are to be built covers an area of 1,400 sq. yds. The cottages, ten in number, will be self-contained, with two rooms each, and yards with the usual out-offices, and a garden plot in front. These will be proceeded with at once, and, it is expected, will be finished within four months.

A Monument to Lord Airlie is being raised on Tulloch Hill, near Cortachy, in Forfarshire. It is modelled on the lines of the old border beacon or warning tower. It is Scottish Baronial in style, with something of the character of that of Airlie Castle, or of the more recent Red Lodge of Cortachy, and is intended to be used, with its signal platform and beacon, on occasions of national or estate rejoicings. The foundation consists of a cairn or platform formed round the base of the monument, with large boulders taken from the hill, while the base proper is set apart for telling the story of the life of the late Earl and his military service. In the base are placed carved panels representing the arms of the Airlie family with inscriptions, and the badges of the regiments in which the late nobleman served. It is 65ft. high, on an eminence 1,230ft. above sea level, and has cost £1,300. It is visible not only throughout the whole valley of Strathmore, but from Perthshire, Fifeshire and Kincardineshire.

A New Grocer's Shop and Cafe at Pontefract have been just completed in the Beastfair for Mr. George Hemmant by Messrs. G. Shepherdson & Sons, shopfitters, of Driffield. The front has been carried out in Cuba mahogany, Aberdeen granite, St. Anne's marble and mosaic entrances. The internal fittings and fixtures are all in best mahogany Sicilian marble and faïence tilework. The cafe is on the first floor, and includes gentlemen's and ladies' lavatories, billiard and smoke-rooms, &c. The faïence work has been supplied by Messrs. Carter & Co., of Poole, and the mosaic by Messrs. G. Woolliscroft & Co., of Hanley. The shop is fitted up with a Waygood's lift, and the whole of the fireplaces and stoves are carried out in Burmantoft's ware on the first floor and in the billiard-room. The cafe has been decorated in artistic colours with Hall's washable distemper, and the lavatories carried out in Messrs. Blundell S. Spence & Co.'s petrifying liquid. The ventilating apparatus has been supplied by Messrs. Crossley & Son, of Halifax. The whole of the works have been carried out from the designs of Mr. Charles Keyworth, architect, of Pontefract.

A New Cattle Market at Bodmin has been erected on an acre of ground at West Heath. The work has been carried out by Mr. E. Harris, contractor, Bodmin, and the cost has been about £2,000 exclusive of site. Provision has been made for about 660 sheep, and bullock lairs have been laid for about 600 animals. Roundabout another 400 could be accommodated. The market yard is enclosed by a substantial wall, and it is properly drained. Water is laid on from the mains of the Bodmin Water Co. The eight hydrants fixed will enable those in charge to thoroughly clean the yard in a very short time. The floor is composed of asphalt, while the surface of the lairs is of Portland cement. There are two double lairs and two single lairs. A spacious shed 100ft. in length and 30ft. in width will shelter cows and fat bullocks. The necessary offices include a toll house, an office, a shed for those attending the market, and a weighing house. There are two entrance gates. In the near future there will be two additional gates, giving means of egress and ingress to a new public road. Mr. E. J. Oliver, borough surveyor, designed the premises.

An International Theatre is about to be established in Paris by M. Leon Cavello, who has obtained a concession for the purpose. The building will be erected in the Champs Elysées.

No Photographing at Tintern Abbey.—Now that Tintern Abbey has been purchased by the Crown, the photographing of the beautiful old ruin is no longer permitted. It would be interesting to know the reason for this prohibition.

New Board Schools at Chopwell have been erected; they are built of red bricks, and will provide accommodation for 650 children, the mixed department seating 450 and the infants' department 200. The work has been carried out by Messrs. Turner Brothers, Gateshead, from plans prepared by Mr. Oswald.

The Electric Lighting System at Windsor Castle and plant which were inaugurated some months before the death of Queen Victoria are being extended on a very big scale by command of the King. Under the supervision of the Office of Works a staff of upwards of thirty men are now employed in wiring the State rooms, the private apartments, kitchens, &c., from the central station of the Windsor Electrical Installation Company.

Mrs. Brown-Potter's Proposed Boathouse.—We regret we were unable to give the following particulars in our last issue, when the illustration of the design by Mr. Lionel F. Crane was published. Nothing definite is settled as yet. Provision is made for store-rooms for boats, &c., at the water level, and on the ground floor there is a summer-room which could be used for tea, &c., two bedrooms and a bathroom. There are also three or four bedrooms in the roof. The building in fact would be a sort of annexe to the house, so that visitors could be accommodated should the house be full. The lower part of the building would be of tarred oak, and the woodwork to the summer room, &c., of deal painted white. The part of the building facing the land would be of brick rough-casted, and the roof would be covered with red tiles.

The Clergy and Artists' Association for the improvement of art in churches will hold their sixth annual Church Congress exhibition in the Pavilion, Brighton, by permission of the committees of the Pavilion and the Church Congress during Congress week. The great feature, as before, will be the exhibition of the personal work of artists working independently in churches, and will include, in addition to examples of work executed under the auspices of the association, a representative collection of the work of individual artists working in churches. Artists wishing to submit work may do so on addressing the secretary by letter at the offices, 6, Millbank Street, Westminster, S.W., up to September 21st. The committee are glad to consider any work of suitable design, direction and feeling. The hon. secretary writes that a list of work in churches throughout the country and the colonies executed through the association during the six years of its work is being prepared and will be sent to any persons desirous of information from the offices of the association.

Surveying and Sanitary Notes.

A New Road at Grimsby has been presented by Sir Walter Gilbey, owner of the Little Coates Estate, near Grimsby; it is about one and three-quarter miles in length, and situated near the site of the proposed new docks in the estate.

Portsmouth Drainage.—For some time past Portsmouth has been threatened with a difficulty over its drainage, and the sanitary committee propose to spend something like a quarter of a million of money on a new scheme which will afford the necessary relief and satisfy the Treasury, who, it will be recollected, threatened to stop their contribution to the local rates if a new scheme is not provided. Portsmouth is one of the very few towns in the kingdom which possess a limit to the rate for sanitary purposes and the finance committee now intimate that if this expensive scheme for drainage be undertaken, that limit (which is 2s 6d. in the £) must go. The matter is one which is likely to give rise to a lively controversy.

Trade and Craft.

Boilers for Hot-Water Supply.

Messrs. Hartley & Sugden, Ltd., of Atlas Works, Halifax, send us a copy of their new boiler catalogue, which is excellently printed. A good feature is the statement of actual heating powers of the various boilers, the calculations being based on the ability of 1 sq. ft. of direct heating surface to heat (with economy and under average conditions) 35ft. of 4in. pipe, and the flues in proportion. In the "Notes" given at the beginning of the catalogue attention is drawn to the necessity, in constructing flues in the brick-setting of boilers, not to throttle the draught: 5in. and more of flue space should be left, according to the size of the boiler. Boilers are sometimes irreparably damaged or soon worn out by deposit and accumulation of sediment. To avoid this evil it is absolutely essential to have mudholes or plugs, so that the interior of boilers can be regularly and thoroughly cleaned at intervals. This is especially important in districts where the water contains lime in solution. The "Lawrence" boiler is slightly more expensive than some other patterns, but presents an unusual amount of heating surface by an inner circle of tubes and a circular flue round the boiler. Two of these boilers of the largest size are heating the Apollo Theatre, London. The "Effective" boiler has increased heating surface provided by bent tubes in the firebox and two large open flues behind the firebox. The "Hornet" boiler is the firm's newest pattern. It has two heating chambers, one at each side of the firebox, and either of these may be shut off at pleasure when a reduced heat is required. The waterway walls of the firebox are so arranged that sediment will fall to the bottom of the boiler. The "Wasp" boiler is especially useful for a smaller apparatus than those we have already mentioned, although it may be made in larger sizes. Its chief feature is a jacket which provides a flue service all round the outside of the boiler, thus considerably increasing its heating power for the same consumption of fuel. The No. 3E pattern is a boiler exceptionally useful for hotel purposes, or in any case where a large hot-water supply is required. This boiler is provided with a waterway bottom so that no injury can be done to it by the rapid drawing off of hot water. The "Hotel" boiler is similar, with a mantle providing an outer flue and thus increasing the economy of fuel. These are some of the boilers made by Messrs. Hartley & Sugden, but in addition to those for heating buildings there are others for providing steam for cooking, agricultural and motor purposes. All are constructed of wrought iron, and therefore not so liable to fracture and failure as cast-iron boilers.

New Companies.

Chytane China Clay Co., Ltd.

Registered to acquire clay mines, brick clay tin ore, mining workings, mining claims and ground in Cornwall or elsewhere; in particular to acquire mining rights in relation to all such parts of the lands of F. Retallack, called Chytane and Chypraze, in the parish of St. Enoder, Cornwall, as are demised for such purpose by the said F. Retallack to Colonel R. J. Morrison, F. C. Frost and T. H. Bennett, and to carry on the business of china-clay merchants, brick and tile merchants, coal, stone, lime, timber, building material and machinery merchants, tin ore merchants, engineers, &c. Capital £3,000 in £1 shares. Registered office: 23, Orchard Gardens, Teignmouth, Devon.

Romiley Spinning Co., Ltd.

Registered to carry on the business of spinners weavers, &c.; also to carry on the business of brick and tile makers, but only to the extent of using up any clay found on the company's land. Capital £10,000 in £5 shares. The first directors are H. W. Whitworth, G. R. A. Ashworth, T. Walton, J. Hall and J. H. Pickup.

Godwin & Hewitt, Ltd.

Registered August 17th to carry on the business of manufacturers of and dealers in bricks, tiles, pipes, terra-cotta, pottery, sanitary ware, fireplaces chimneypieces, kerbs, colours, glazes, &c. Capital £25,000 in £10 shares. The first directors are W. Hewitt (chairman and managing director), J. Corner and J. Carless.

Thomas A. Aspden & Sons, Ltd.

Registered to acquire and take over as a going concern the business of timber and slate merchants and sawmill proprietors carried on by Thomas A. Aspden, Harry M. Aspden and William E. Aspden at Daisyfield Sawmills, Blackburn, Lancashire, under the style or firm of Thomas A. Aspden & Sons; to adopt an agreement with Thomas A. Aspden, Harry M. Apsden and William E. Apsden; and to carry on the business of timber merchants, sawyers, steam sawmill owners, importers and exporters of timber, slate merchants, dealers in stone, marble, bricks, cement, lime and builders' requisites, builders, contractors, carpenters, fitters, joiners, woodworkers, dealers in manufactured woodwork, quarry owners, house and property owners, &c. Capital £50,000 in £10 shares. The first directors are Thomas A. Aspden (chairman), Harry M. Apsden and William E. Apsden. Registered office: The Daisyfield Sawmills, Blackburn, Lancashire.

James Storer & Co., Ltd.

Registered to acquire and carry on the business of James Storer & Co., oil merchants and paint and colour manufacturers, Barrowfield Works, Bridgeton. Capital £15,000 in £1 shares. Registered office: 201, Reid Street, Glasgow. No initial public issue.

The Graham Properties Co., Ltd.

Registered to enter into any working or agency arrangement with the firm of William Graham & Co., merchants, Glasgow, and to carry on the business of a land and property investment company. Capital £100,000 in £10 shares. Registered office: 55, Cathedral Street, Glasgow.

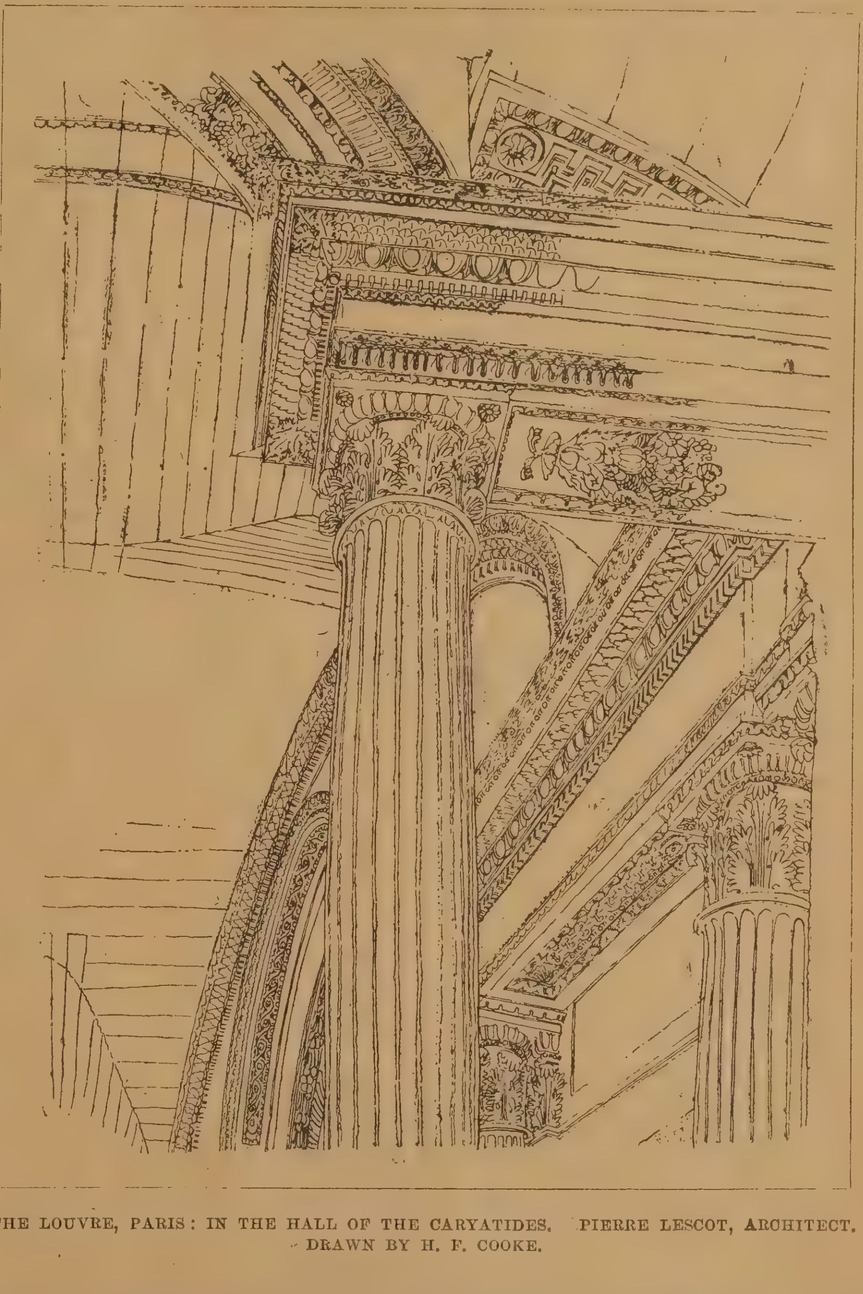
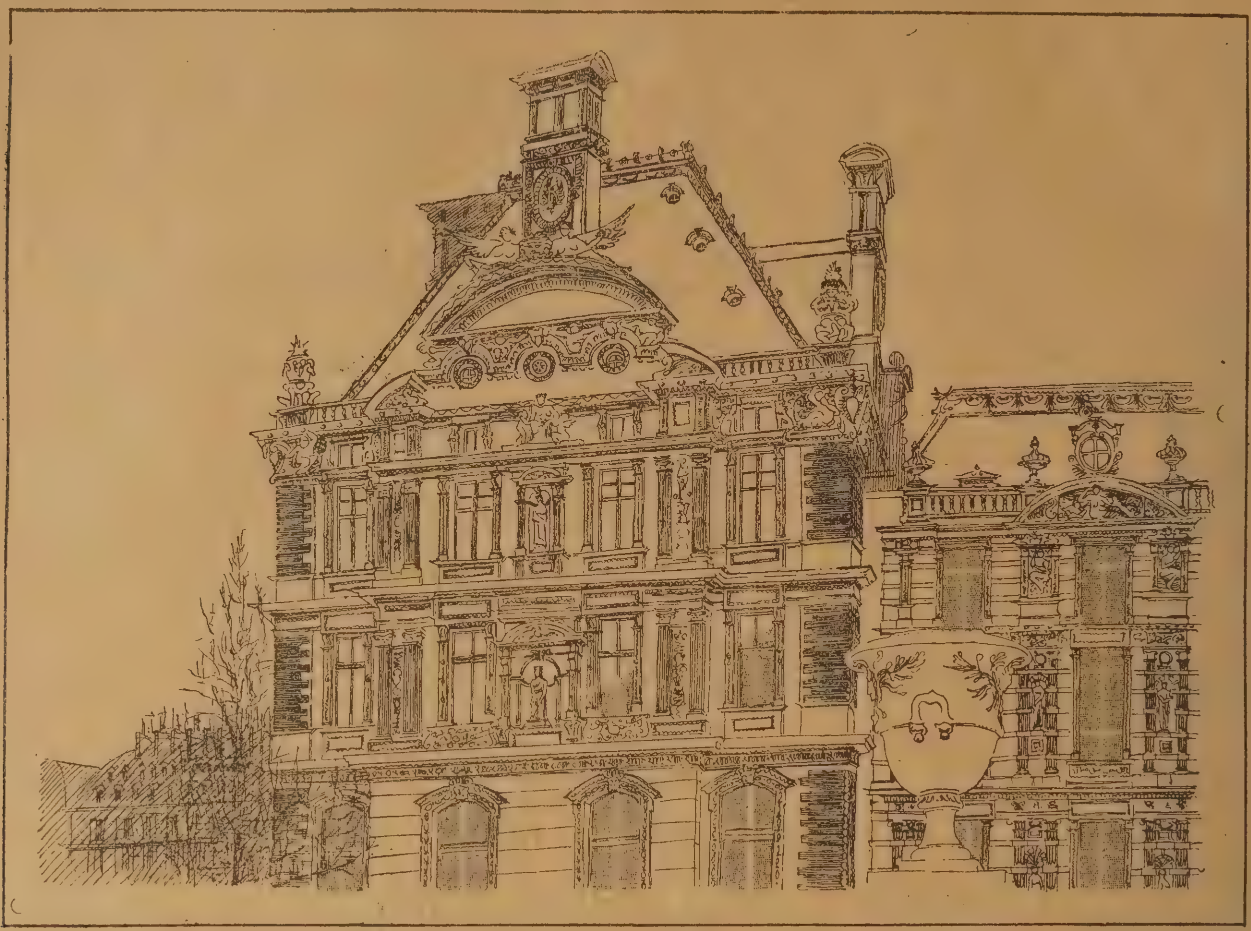
The Public Advertiser. THE Society for Checking the Abuses of Public Advertising, though doubtless unknown to the majority of people, is certainly working in a good cause ; moreover, their efforts are not in vain, for last session the clauses of the Dover Improvement Bill which gave the town council power over all forms of advertisements within their jurisdiction became law. The council, we are glad to learn, are making use of their new power, and soon those monstrous erections which have so long disfigured the bay will be removed ; and likewise the replica which destroyed the grace of Southampton Water has, at the insistence of the ground landlord, also been removed. There is no person who is so responsible for the destruction of all harmony in city streets as the advertiser, and anything which tends to check his abuses will surely have the support of all reasonable citizens. We certainly trust, with Mr. Richardson Evans, the hon. secretary of the above-named society, that every municipality which has to go to Parliament next year for powers will incorporate in their Bill the Edinburgh—or, better still, the Dover—clauses.

In the Land of the Mikado. THE Japanese are no less talented as artists than they are progressive in practical mechanics and commercial life. But it has been the constant statement of European and American collectors that since the country opened itself to Western knowledge and methods the quality of the art produced has greatly deteriorated ; yet, judging from the several exhibitions of Japanese artists which correspond to those organised in Bond Street and Piccadilly, the truth would appear to be exactly opposite. It is a fact that the products of the first years under the new régime were inferior, owing to the false conceptions of Western taste which the native artists adopted as a standard ; but since then all such perversions have disappeared and their place has been taken by works of merit—in some cases of greater merit than those of the pre-Western era. The Japanese saw the futility of pandering to public taste. They decided to educate it, with the result that their work has been steadily rising to higher levels. We have it on the most recent authority that in lacquer the Japanese are at least as great as they ever were, while in *cloisonné* enamel, in sculpture, in ceramics, and in metal-casting they have quite surpassed their predecessors. Sculpture affords remarkable proof of improvement. The inability of the old Japanese artists to produce an accurate sculpture of the human body was remarkable when it is remembered they were so skilful in rendering facial expression and drapery. Lack of scientific training was the inference, yet this was proved to be erroneous by an artisan and his successors—men of the commonest class—who began to sculpture wooden figures "as faultless anatomically as the works of Greek masters" (who themselves knew nothing of anatomy as we now know it, analytical surgery being then non-existent). The tiger as portrayed by the old Japanese masters had a magnificent skin, but a strange beast was inside it, for they had never seen a tiger. Western civilisation, however, with its circus, changed matters, and the tiger is now shown with realistic force. Everything goes to show that the Japanese artist of to-day is capable of producing work equal to the finest creations of his ancestors. As regards the architecture, it fails when measured by Western standards. We see, however, in the modern work the dominating influence of the American and European schools, and as an example we may direct attention to the new Imperial palace at Tokio illustrated in our issue for September 4th, a classic building following close after American, and consequently French, models.



THE LOUVRE, PARIS : IN THE HALL OF THE CARYATIDES. PIERRE LESCOT, ARCHITECT. DRAWN BY H. F. COOKE.

The London Building Act. THE London Building Act of 1894 extends to "London and no further," an expression which means the Administrative County of London ; but this does not include "the City," which comprises all parts now within the jurisdiction of the Corporation of London. Our reader are of course familiar with these facts, yet is it not surprising that the Act does not apply to the whole of London as generally understood ? It is evident that fires are likely to prove more disastrous in narrow streets than in wide ones, hence the by-law which requires a certain proportion to be observed between the height of the buildings and the width of the street ; but in the City there are no such restrictions, and the result is that tall blocks of buildings are crowded in narrow thoroughfares. The defect is obvious. It is to be hoped that in the future the Act will be so amended that new buildings and streets in the City are made conformable to the regulations which govern those in the rest of London.



THE NEW LOUVRE, PARIS: PAVILLON DE MARSAN. LEFUEL, ARCHITECT. DRAWN BY H. F. COOKE.

SOME PARIS SKETCHES.

THE following particulars are given in connection with the accompanying sketches by Mr. H. F. Cooke :—

Jules Hardouin Mansart, who was born at Paris in 1646 and died at Marly in 1708, was the grandson of the eminent architect Francois Mansart. His master was Libéral Bruant, who employed him in 1666 to conduct the works in progress at the Hotel de Vendôme. He was presented to King Louis XIV., and had the knack of pleasing the monarch, who asked him to submit a design for the Château de Clagny. The carrying out of this work was deferred, but in 1674 Mansart was entrusted with the enlargement of the Château de Saint-Germain, and a year later he received the distinction of being appointed Architect of the King's Buildings. The most important work of this architect was the Château de Versailles. He was engaged on its construction from 1678, but was unable to complete the work during his lifetime, the chapel (which is considered to be the finest portion) not being finished till 1710, after Mansart's death. The royal residence of St. Cyr was begun by him in 1685 and completed the following year, and almost within the same time this indefatigable architect began the remodelling of the Place Vendôme, the buildings on which were not altogether completed till 1698. The work which, with Versailles, has most contributed to Mansart's fame is the dome of the Invalides. As already mentioned, Mansart did not live to see the completion of his chapel at Versailles. This was entrusted to his brother-in-law, Robert de Cotte, whom he had trained and who had aided him on several occasions, especially in the reconstruction of the town hall at Lyons, which had been destroyed by fire in 1674. Robert de Cotte also executed, after the designs of Mansart, the high altar in the house of the Jesuits in Paris, and undertook the transformation of the choir of Notre Dame in accordance with the wish of Louis XIII.

Pierre Lescot was born in 1510 and died in 1578. His first work was the beautiful porch of St. Germain-l'Auxerrois in Paris, which Jean Goujon decorated with sculptures; this porch, however, was unfortunately destroyed in 1750. In collaboration with the same sculptor, Lescot constructed the famous fountain of the nymphs (called the Fountain of the Innocents) at the angle of the Rue aux Fers and the Rue St. Denis, but this fountain underwent great changes at the hands of other architects. Lescot was the inspirer of the Louvre. He commenced the western wing in 1546, and completed the Salle des Caryatides in 1548 and the south-west pavilion in 1556. The construction of the half of the southern wing took place between 1558 and 1564.

As regards the accompanying illustration of a portion of the Pavillon de Marsan, some particulars of the architect Lefuel will be found on page 22 of our issue for August 28th last.

A.A. BROWN BOOK.

THE Architectural Association Brown Book for the session 1901–1902 gives, in addition to the usual particulars, the full curriculum of the new day school. The following are the subjects set in the School of Design: Elementary class: stone carriage gateway, cost limited to £150; lead pedestal with bronze or brass sundial plate; mortuary chapel, cost limited to £200; small glass screen across a hall, 12ft. 6in. high by 8ft. wide, the cost limited to £30. Advanced class: small wooden bridge with stone piers and abutments; small country house, cost not to exceed 1s. per cub. ft.; Sunday school to accommodate 250 scholars; chancel screen in wood, 20ft. wide, gilt and decorated in colour, cost limited to £250. The subject for the Association silver medal is "A monumental fountain in a public garden 100ft. square, surrounded by a road 40ft. wide, into which four other roads lead, N., S., E. and W. Garden to fall 1 in 10 N. to S." The subject for the essay prize is "The life, work and influence of Robert Adam and his brothers."

The Committee is gratified to be able to report that the fifty-fourth session, which terminated on May 31st last, has been a prosperous one in every respect. The membership again shows a substantial increase, and financially the session has been a great improvement over previous years: 116 new members were elected, six were re-instated, and the losses by death, resignation, and other causes amounted to thirty-seven, the total membership on the last day of the session being 1,376.

The Royal Institute of British Architects has again generously contributed a grant of £100 towards the educational work of the Association. This has been of great assistance, for although the amount of students' fees exceeds the instructors' fees, rent and other expenses have to be provided for. The Premises Sub-Committee, after mature deliberation, has come to the conclusion that it is impossible to take advantage of any desirable building sites that may offer themselves until a substantial premises fund has been formed. It is therefore proposed to take steps towards this end. The office and library have been transferred to the front room on the ground floor, and the former office has been re-decorated and fitted up as a common room. This arrangement provides better accommodation for the office staff and library.

The Committee desires to place on record the names of those members who volunteered for service in the South African War, namely: Messrs. H. G. Bulman, J. S. Dunn. A. W. Earle, J. Haslam, C. H. R. Henman, W. S. Huxley, J. S. Lee, H. Passmore, P. Procter, F. N. Reckitt, J. B. Royle, C. Hodgkinson Smith, together with Messrs. W. F. Coombs (Artists' Corps), E. D. Ford (Imperial Yeomanry), and A. Lovejoy (South African Light Horse), who unfortunately succumbed to disease.

With regard to the educational work of the Association, 224 individual students attended the studio and evening classes. These numbers show an increase in Division I. The general accounts for the past session show an excess of income over expenditure of £517 odd.

New Board Schools at Leyton are to be erected in Farmers Road from designs by Mr. W. Jacques, architect, of Fencourt, E.C.

THE DECADENCE OF ARCHITECTURE IN BIRMINGHAM.

UNDER this title a correspondence has been started in the "Birmingham Gazette" by Mr. John Stratham Davis, who says:—

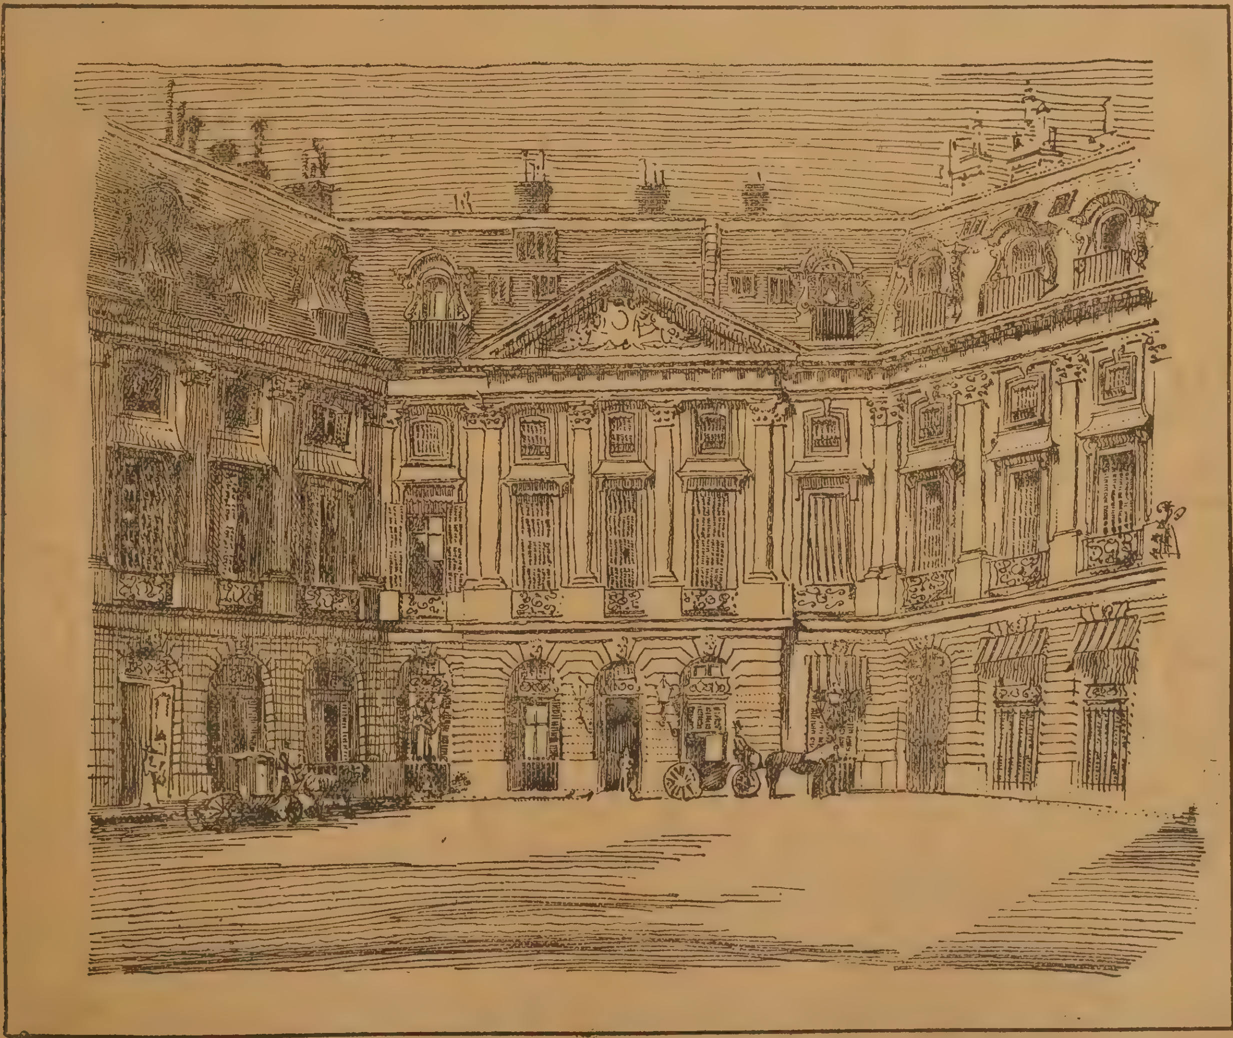
For some time past the idea has frequently occurred to me to offer a remark or two relative to the present state of architecture in this city, and I think the time is now ripe for such a purpose. For the last twenty or thirty years Birmingham has been demolishing and rebuilding at a furious rate; and now to all intents and purposes it may be denominated a new city—at least the central portion. Among the hundreds of new erections planned and designed by different minds, it would be unreasonable to expect that these structures should be of uniform excellence. Some few are really beautiful in nearly every architectural feature, *e.g.*, the Mason College, and (former) Liberal Club adjoining the School of Art, the Cobden Hotel, the Louvre, the Victoria Courts (an exceedingly fine building, though perhaps somewhat overcrowded with ornamentation), the charming shop buildings in Corporation Street erected for Messrs. Liberty, the noble premises in Bromsgrove Street occupied by Messrs. Hawkes, that most lovely building the Corporation Baths in Monument Road, and perhaps a few others. In these buildings, although the style adopted is mainly Gothic, yet the architectural treatment is exceedingly diversified. There is no slavish copying of the antique; all modern improvements in construction, &c., have been incorporated: in fact, speaking broadly, these buildings are what the old Gothic architects would have designed had they lived in our own times.

But the majority of our new Birmingham erections, those in Corporation Street and Colmore Row in particular, are of very peculiar style (or styles), and of course their merits must be judged from a peculiar standpoint. Some are merely commonplace—they do not greatly offend the eye of the observer; they are simply colourless; they excite neither feelings of admiration nor contempt. Their makers have partly studied the "Glorious Five Orders," and have lost the book. A goodly number of our new buildings in the localities just mentioned are, if possible, still poorer in design than the foregoing, but to compensate for this deficiency they are well "plastered over" with an abundance of scroll-work, leaves, flowers, heads, fret-work, and a variety of other embellishments of the most bizarre and absurd kind, so that the beholder is struck with astonishment if not with awe. To speak candidly, such buildings have not a trace of real architecture in them. They evince neither thought nor feeling for art. The money must be spent somehow, their makers argue; and how can it be more judiciously expended than by "piling up the agony" with this vast amount of ridiculous ornamentation? We want our buildings to show "brains" as well as mere money value.

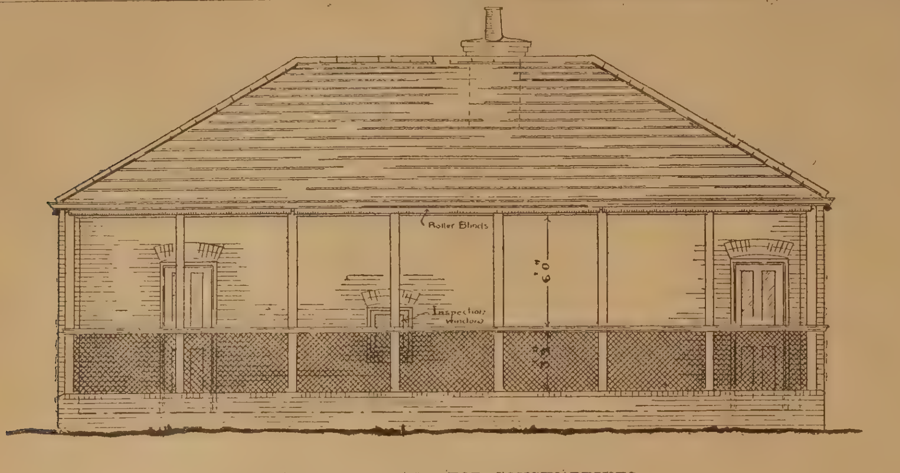
I regret to say that the architectural profession is fast degenerating into a mere money-making trade. This of itself must surely blight the art feelings of our nature. The general public, I fear, too often value the architect only for the quantity of work he can "turn out." The quality of that work is of mere secondary value. In this age of scientific improvement and discovery it may be quite possible to invent some mechanical contrivance that will obviate the necessity of any expenditure of brain-power on the part of the architect. He may either turn a handle or put a penny in the slot, and lo! the design for a new building is in his hand. But, speaking seriously, I am fully convinced that we cannot possibly put too much "thought" into our buildings if we wish them to live. We must not design them haphazard, and think that because they are highly ornamental they are also architectural. Some very beautiful buildings indeed have been designed with scarcely an ornamental feature upon them.

A BLOCK OF 900 OFFICES.

ONE of the largest of the new edifices which have been erected in connection with the widening of London Wall from 45ft. to 50ft. is Salisbury House. It covers almost an acre of ground, and possesses a superficial area of 50,000ft. Its frontages total some 800ft., made up as follows: London Wall, 300ft., Finsbury Circus, 300ft., Circus Place, 100ft., and West Street, 70ft. The building will be finished by the end of the year, and at the present rate of the letting every one of its offices will be occupied by then. The site was let by public auction in October, 1898, to Mr. Ludwig Neumann at the huge ground rent of £17,000 per annum, an income which goes to the Bridge House Estates Committee. The architects are Messrs. Davis & Emanuel, of 2, Finsbury Circus, and the design is French Renaissance in character. The building comprises eleven storeys, which give accommodation for over 900 offices. These again are sub-divided into suites ranging from one to twenty-five rooms. The frontage to London Wall is devoted to shops. The building is entirely faced with stone. The main feature of the edifice lies in the ample provision which has been made for light and air. Large areas are provided to give ample light, and every office is faced with ivory white glazed bricks. The electric mains throughout the house have been installed by Messrs. Strode & Co., Osnaburgh Street, under the supervision of Mr. Charles E. Skelton, A.M.I.E.E., consulting engineer, 1, Finsbury Circus. The various floors are reached by seven passenger lifts and four staircases. There are about seventy strong-rooms, very carefully designed; a number of spacious halls for the meetings of companies, a luncheon-room, a newspaper agency, a public telephone call-office, and, in fact, everything that appeals to a commercial man and facilitates the conduct of his business.



NORTH-EAST ANGLE OF THE PLACE VENDÔME, PARIS. J. H. MANSART, ARCHITECT. DRAWN BY H. F. COOKE.



ELEVATION OF WARD FOR CONSUMPTIVES.

SANATORIA FOR CONSUMPTIVES.

By ALBERT C. FREEMAN.

THE disease of tuberculosis, which is spreading so rapidly in this country, is not only receiving the attention of all medical authorities but the Government has (not before time) appointed a Royal Commission to thoroughly investigate the theories of Dr. Koch, so as to ascertain whether or not this disease is inherited, or transmitted from animals.

Sanatoria are being erected by various hospitals to cope with infected cases, and the form of treatment adopted is what is known as "the open-air cure."

The arrangement and construction of the wards for this disease differ materially from ordinary sick wards; the patients are being placed in a ward quite open to the air, with practically no protection from the weather. Medical authorities contend that this is the best form of treatment, and so far the results have been most satisfactory. The change of air being so frequent, the patients' lungs are hardened and strengthened.

I visited the North London Hospital for Consumption, where the open-air treatment is in general use, and was agreeably surprised to find how well the patients looked after going under the extreme trial. In this hospital wooden structures have been erected at the rear of the existing buildings, the same having a due south aspect; and, in addition, the balconies which lead off the wards are also used for the same treatment, two beds being placed in each balcony, one at each end. The windows of the ordinary wards are always kept wide open top and bottom so as to secure a constant change of air. This building can hardly be taken as a good example, as it is an old one which has been converted into a consumption hospital; but it gives a general idea of what should constitute a consumption sanatorium.

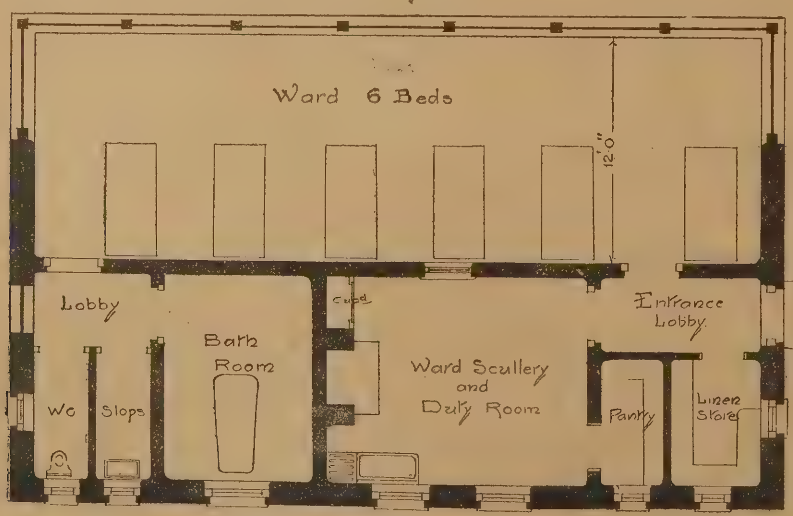
When erecting these sanatoria the main points to be borne in mind are the character of the soil and the selection of a suitable elevated site. The site should be in the open country or by the sea-side, and be of a clean, porous and dry soil, having free circulation of air around it, and, if possible, sheltered from the north and east. The pavilions should be scattered about the site, having in all cases a south-west aspect for the wards, and sheltered from the north winds. The pavilions may be erected with one or more floors, to suit the required accommodation. It is not advisable to place a large number of patients in one ward; from six to ten will be found most satisfactory.

Each ward should provide about 72 super. ft. and 750 cub. ft. per patient.

When constructing the ward, it is most essential for the ends to be enclosed sufficiently to guard against draughts descending on the patients lying in the end beds. The remaining portion of the ends and the front of the wards should be left quite open to the air, as shown in the accompanying illustrations. The lower portion of the framing should have a handrail, and be fitted with either galvanised wire or iron railing about 3ft. 3in. high. A dwarf wall should be built around the verandah, standing about 9in. to 12in. above the floor. The floor should be constructed of concrete with tile facing or other hard substance, and have a channel in it to carry off any water which may drive in during wet weather. Outlets should be made in the channels, and wastes taken from them to discharge over trapped gulleys outside. No gulley or other trap should be fixed inside these wards, as the trap is liable to get unsealed and cause foul gases to arise, which would be disastrous to the patients.

On the outside of these verandahs are fixed canvas blinds, with suitable fastenings in the sill for holding them in position when drawn down. These blinds are used during inclement weather, to protect the patients from the driving rain.

The inside walls of the ward should have glazed brick dadoes, and the upper part finished with a pointed brick face, and the ceiling plastered. It is needless to say all angles should be rounded off for cleanliness. The bath and lavatory accommodation should be in the same proportion as an ordinary sick ward, and planned with a disconnecting lobby for through ventilation. No heating of any description is provided in the wards. When the temperature becomes so low as to affect a patient, he or she is removed to another ward where the temperature may be slightly higher.



PLAN OF WARD FOR CONSUMPTIVES.

A nurses' duty-room or ward scullery should be provided in connection with every ward, situated with easy access to the ward, and having an inspection window to overlook the ward. This room should be fitted with a small cooking-range, and a sink for washing up and cleaning the ward utensils should be provided (but not for slops). It should have hot and cold water laid on, with taps affording a full supply.

There should be provided in connection with the scullery a pantry or larder for keeping the necessary provisions, such as milk, &c.; also a store for towels, sheets, &c.

The general administration building should provide all that is necessary for the treatment and discharge of patients, and the general supervision, and accommodation for staff. A general recreation- and mess-room for the use of such patients who are able to leave the wards should be provided, also stores for the patients' own clothing, which should be disinfected before being stored. There should also be a room (fitted with the necessary apparatus) for the linen and clothing which requires to be disinfected.

Although consumption is not really infectious it is in these institutes treated to a great extent as an infectious disease.

NEW EDINBURGH BOARD SCHOOLS.

TWO new Board schools have recently been opened in Edinburgh, named the Flora Stevenson School at Comely Bank and the Parson's Green School, adjoining the King's Park. These new schools, which have been modelled on almost exactly the same lines, have been constructed on up-to-date principles, and the children who attend there will be taught under most favourable conditions as regards good light, plenty of fresh air and healthy situation. There are open spaces all round both establishments, and from Parson's Green School, which stands very high, a splendid view can be obtained of the park on one side and the Forth and the coast of Fife on another. This school has accommodation for about 1,450 scholars, and that at Comely Bank for some fifty or so less. The new schools are large and solid-looking buildings, with somewhat plain exteriors. The fittings and furnishings are of the latest and most improved types. There is a large central hall, with two galleries, and it is from this hall and these galleries that entrance is obtained to the classrooms, admission to the upper flats being got from wide staircases at each end. The whole of the ground floor will be occupied by the infant department, and the upper flats will be set apart for the seniors and juniors. In addition to the ordinary classrooms, there is a combined workshop and cookery classroom and a gymnasium on the top floor. The centre of the roof is covered with glass, and a good light is thereby obtained. Large rooms have been set apart for the gymnasiums at both schools. Both schools are lighted with electricity, ventilation is obtained from fans driven by electric motors, and the heating is done by hot-water pipes. Among the other alterations carried through has been the building of a new infant department in connection with the North Canongate School. It also has a large central hall, with classrooms entering from it.

Govan Public Baths, which have been erected at the corner of Church Street and Summertown Road by the Govan Town Council, were opened recently. Both the ladies' and the gentlemen's swimming ponds are of the regulation size, 75ft. by 35ft., the former having a depth of from 2ft. 6in. to 4ft. 4in., and the latter from 4ft. 3in. to 7ft. 3in., with a diving ladder 13ft. high at the deep end. The scheme involves a capital expenditure of between £24,000 and £25,000.

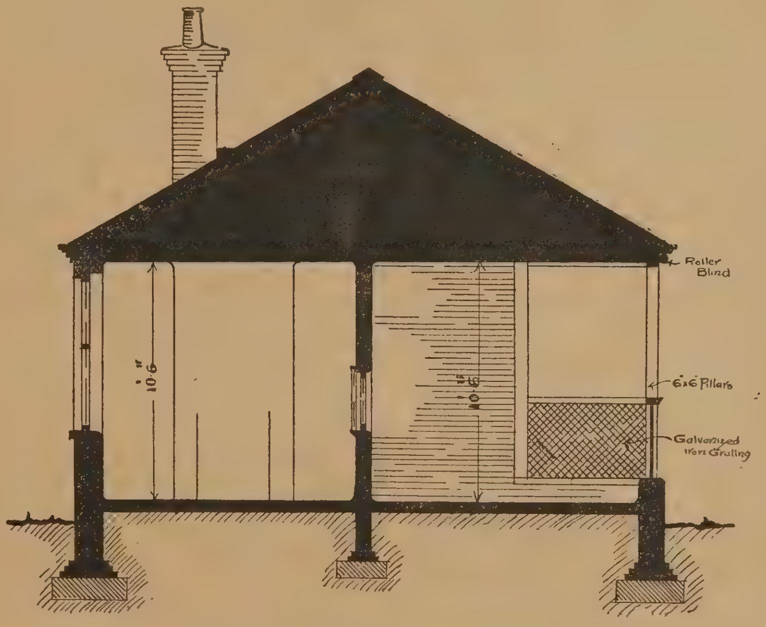
LIVERPOOL'S NEW TECHNICAL SCHOOL AND MUSEUM.

"THE finest site in England" is a description frequently applied to that portion of Liverpool of which St. George's Hall is the centre, and when the whole scheme of improvement decided upon by the Corporation is completed it will be still further bettered. The whole facade of the buildings in William Brown Street is striking. Including the Walker Art Gallery, the Rotunda Reading-Room and Lecture Hall, and the Brown Library and Museum, besides the County Sessions House, there is a frontage of public buildings which extends roughly for 850ft., and if we include the Byrom Street front of the Technical School the figure will be about 1,040ft., or nearly one-fifth of a mile. The area covered by this range of buildings is approximately no less than 17,409 sq. yds.

Not the least important feature of this architectural combination has just been completed by the erection of the building which terminates the Classic pile fronting William Brown Street—the new School of Science, Technology, and Art and Museum extension. Mr. E. W. Mountford, F.R.I.B.A., is the architect, having gained the award in open competition. The space is unduly cramped by the demands of an adjacent firm of tradespeople, while the curving line of the street added to the awkwardness of the site. The problem was got over in various ways, chiefly unsatisfactory and some of them impossible, by the other competitors, but Mr. Mountford curved his frontage in a bold arc, thus solving the difficulty, and adding to the building a striking feature.

The new school is described as of the modern nineteenth-century Classic style, and is built of Stancliffe stone, from the same quarry, in fact, as that which supplied the material for St. George's Hall. The boldly-curving front in Byrom Street is the chief elevation, and here is situated the large and imposing main entrance. The strongly-marked external features of this front indicate the interior divisions and arrangements, for the lower portion, with its numerous windows and rusticated base, form the technical school, while the columnated portion above, with the sixteen Ionic columns and broad balustraded windows, is devoted to the purposes of the museum. The main entrance is approached by two flights of steps leading to a broad and ample landing. The steps are flanked by a circular balustrade, terminating on either side in large pedestal piers, upon which will be erected large bronze lamps, to be fitted with the electric light. From either side of the entrance rise heavy columns supporting a pediment bearing statues of heroic size. These statues are from the studio of Mr. Pomeroy, who has executed the whole of the sculpture which adorns the building. The figures over the entrance hall represent Art holding up the mirror to Nature and caressing the famed anatomical study by Michael Angelo, and Science, veiled, and with a crucible. Immediately above the main entrance pediment, and extending along the whole front, rise sixteen Ionic columns with carved capitals and volutes, these supporting a richly-decorated cornice, which is surmounted by the balustrade above. The large columns, over 30ft. high, harmonise with those of the other buildings in William Brown Street, and are practically upon the same level. This seems curious in view of their height above the street level, but so great is the fall of the roadway between the entrance to the present museum on the plateau and Byrom Street that the bases of these columns are actually 2ft. above the columns on the plateau. The features of the William Brown Street frontage are the bold projecting bays, with their deep vaulted arches enriched with simple decoration, and surmounted in the pediments by groups of statuary. The character of the Byrom Street front is reproduced in the marking of the divisions of the building; the lower portion coinciding in design, while from the Museum level there rise square pilasters supporting the main cornice and pediments. In the groups of figures occupying the pediments Mr. Pomeroy has sought to represent by allegory the prevailing spirit of the city. Minerva, as representing the wisdom of the city, with shield and spear, protects and presides over the education of the community. On one hand is the bearded figure of an old man instructing an eager boy in the mysteries of science, and on the other a young mother is carefully directing the thoughts of her child to some sheep, typifying the agricultural interest. The second pediment contains another group, of which the principal is a seated figure holding a globe and sceptre, representing Liverpool, this being supported on either side by female figures typical of commercial life and industrial occupations. The sculptured figures on the pediments of the arches represent Astronomy, Navigation, Geography and Agriculture.

In the interior of the building the entrance hall requires first mention. Passing through the oak screen which surrounds the interior doorway, the visitor finds himself in a lofty vestibule. This is surrounded by a dado of oak, and the same material lines the hall. Fluted oak columns with carved capitals support the cornice, and from this spring the arches supporting the high-domed ceiling. When illuminated an effect is secured in the dome by vitreous mosaic in shaded blue tints, sprinkled with dots of gold, thus imitating the appearance of a starry sky. Tinted panels modelled in low relief adorn the spaces between the arches. Beyond this vestibule is the lofty cool hall, with black and white marble-tiled floor and massive columns of brilliant red-veined Devonshire marble, supporting a superstructure adorned by Mr. Pomeroy. Panels illustrate the rise of shipbuilding, and the marble fireplace, which forms a feature of the hall, is surmounted by a representation in relief of the city crest. Broad corridors branching right and left of the entrance give easy and immediate access to every room on the various floors, while two spacious and well-lighted staircases on the side passages establish ready communication between them. The corridors, staircases and all the classrooms and workshops throughout the building are well lighted. The light for the internal elevations is obtained from a large courtyard on the east side of the building and two smaller ones in the centre, which are all faced with white-glazed bricks. The ground-floor corridor on the entrance side, which is lined with bird's-eye marble from Derbyshire, has a semicircular vaulted and panelled ceiling, and the deep windows are filled with leaded lights containing shields with scrolls recording the names of the chairmen of the Building and Technical Instruction Committees. Immediately opposite the entrance are the swing doors of the large lecture-hall, a chamber of simple design. The floor is of polished oak, and the walls are lined with a high dado of light canarywood in its natural colour. From this dado spring the outline of the ribs supporting the vaulting ceiling, in which are placed large circular windows. At the north end is a raised platform, above which appears an elaborate panel designed by Mr. Pomeroy and representing a group of students receiving awards from the hands of the presiding genius of education. An adjacent corridor gives access to the committee-room, a spacious apartment. The room is lined with a panelled dado painted a dead or "flatted" white, and fluted columns with carved Ionic capitals support the panelled ceiling, with its large encircling wreath of modelled fruit. The floor is of polished oak, and the mantelpiece is formed of Irish green marble and red-veined alabaster. There is a niche in the mantelpiece in which Mr. Pomeroy's bronze bust of the late Queen Victoria will be placed.



SECTION OF WARD FOR CONSUMPTIVES.

The aim throughout has been, so far as was compatible with cost and the limits of decoration in a building devoted to classrooms, workshops, and the like, to use work not only of good design but such as would appeal to the students as meritorious specimens of handicraft and technical ability. In the metalwork, for instance, the handsome dog-iron antique stoves in the committee-room and in the vestibule are fashioned entirely in wrought and hammered ironwork by Mr. Nelson Dawson. They are fine specimens of handicraft, and the same may be said for the electroliers of repoussé work which appear in the vestibule and elsewhere. The wrought-iron entrance gates were made by Singers, of Frome, while those at the Byrom Street side entrance are from the Bromsgrove Guild of Arts and Crafts, Messrs. Ramsden & Carr supplying the wrought metalwork at the archways. Mr. Worrall, of Dale Street, Liverpool, has contributed other examples, and the Della Robbia Company have supplied the lining tiles to the handsome fireplaces of the entrance hall and committee room. The entrance, vestibule and ground-floor corridors have been floored in marble to the architect's design by Norbury & Patterson, of Edgehill; while the bird's-eye marble wall linings are from the picturesquely situated Ashford Works. Torquay quarries supplied the richly-veined Devonshire marble columns which form so striking an addition to the vestibule. With regard to the general corridors, a restful green is the prevailing tint, and with the joinery in the same colour an agreeable and welcome change is made from the conventional and time-honoured brown tint. The arrangement of the rooms of the Technical School has already been described in a former article; and it is only necessary to add that the fitting up of the chemical, electrical and engineering laboratories, the class- and workrooms, and executive offices has been done by Messrs. Brown & Backhouse from detailed instructions supplied by Mr. W. Oulton, the chairman of the Technical Instruction Committee, and Mr. Hewitt, the director.

It must not be forgotten that the building serves two entirely separate and distinct purposes, one being the provision of space for technical instruction and the other for extending the museum. The museum occupies the upper portion of the building, and entrance to it is only gained from the existing museum premises, which are upon the same level. The addition consists of two immense U-shaped galleries running without interruption the entire circuit of the building, and forming perhaps the finest museum galleries in England. The lower gallery, of over 400ft. in length and 34ft. wide, has a flat roof, and is lighted by large windows in the inner and outer walls. Lined all in white plaster, it is a bright, airy, and spacious apartment, but in this respect is surpassed by the upper gallery. Bold semicircular arched ribs, finely moulded, spring from the side piers to support a roof which is a long dome with skylights running the entire length of the gallery, The museum extension has given opportunity for several structural alterations and improvements. Provision has of course been made for the offices of Dr. Forbes, the curator, and in addition the lending library has been much increased in size. More book-storing space has been provided, and better accommodation supplied for the staff. In the museum itself the most noticeable change is a rearrangement of the turnstiles and umbrella-room and the provision of a mahogany screen door at the entrance to the hall. Arched connections have also been made between the hall and the Meyer Museum, and other structural improvements greatly facilitate communication between the various galleries.

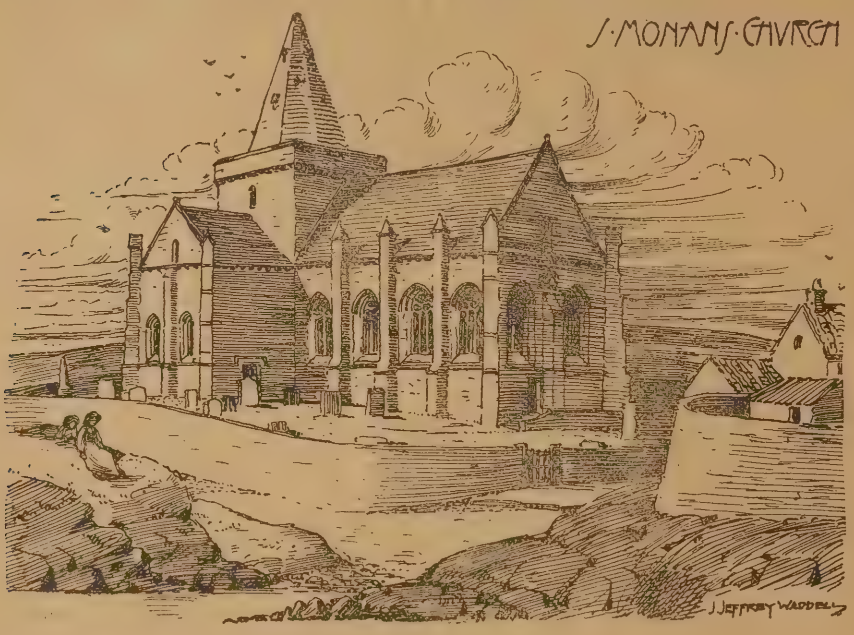
The heating and ventilation is on the "Plenum" system, which has been installed by Mr. William Key, of Glasgow and London. Mr. Scales was clerk of works.

The general contractors for the building were Messrs. Henshaw & Sons, and under them are Messrs. Patterson for joinery, Mr. Kirkland for iron- and steel-work, Mr. Lea for plumbing and painting, and Messrs. Tanner for plastering. Charteris & Longley's patent has been used in the wood-block floors.

Mr. T. W. Pomeroy, from whose studio the whole of the statues and modelled panels which adorn the buildings have come, gained in 1886 the gold medal and the travelling studentship of the Royal Academy. He has been a frequent exhibitor at the Academy and most of the art galleries of Europe and America. Among the work he has designed and executed should be mentioned the statue of William Ewart Gladstone in the Lobby of the House of Commons, and the centenary statue of Robert Burns at Paisley, besides statues of Oliver Cromwell at St. Ives and Robert Blake at Bridgnorth. His latest production is a bust of the late Bishop Ryle.

ST. MONANS CHURCH, FIFESHIRE, N.B.

BY J. JEFFREY WADDELL.



ST. MONANS is one of the most picturesque of the numerous fishing villages that are dotted all along the Fifeshire shore of the Firth of Forth. It is a favourite haunt of artists both from the east and west of Scotland, and hardly an exhibition is held which cannot boast of one or two views of this picturesque spot. But while the village with its fishing and boatbuilding is full of picturesque "bits," it owes much of its charm to the fine old church which, rising up from its midst, fitly crowns and completes the picture.

The church is situated on the rocks close to the sea and near a small stream. As might easily be imagined, it has suffered much from the violence of the weather. Last year it had reached such a state of disrepair that it became necessary, if it was still to be used as a place of worship, that the church should be re-roofed. Apart from the fact that the roof was not weatherproof, a considerable thrust (due to the imperfect tying of the timbers) was being exerted on the walls, tending to throw them out, and endangering the stability of the vaulting.

Mr. Baird, of Elie, offered to restore the church, and Mr. P. Macgregor Chalmers was appointed architect of the work. He has had to contend against a lot of prejudice, many being in favour of letting the church go to ruin rather than risk spoiling its present picturesque appearance. The old roof was certainly of a very harmonious colour, but after all this was not the original roof, being only about seventy years old—and a roof that admits seagulls into a church is hardly worthy of the name. The new roof is of large slabs of Caithness paving, which have a pleasant colour and should weather and wear well. The whole is crowned with a stone ridge.

The church and village derive their name from St. Monan, who, according to tradition, suffered martyrdom at the hands of the Danes on the Isle of May, off the coast of Fife, in the eighth century. He is said to have been buried on the site of the present church. In 1362 David II., in gratitude to St. Monan, commenced the larger church which we see to-day. James III. bestowed it on the Dominicans, since which time it has endured a chequered career, but still remains fairly well preserved.

It consists of a chancel 50ft. long by 23ft. inside, and transepts, with a tower and spire over the crossing. The nave, though evidently intended, has never been built.

The chancel is divided into four bays, marked externally by buttresses with Scotch terminations and having traceried windows between them. The east-end and south transept have each two traceried windows with a buttress between. In the south wall of the chancel there is a fine sedilia and piscina. A turret stair in the north-west angle of the crossing leads to the tower which rises a short distance above the ridge, is terminated by a parapet supported on corbels, similar to those at the eaves, and is capped by a squat octagonal spire having lucarnes, but much weather-worn and without a finial.

To the north of the chancel there was a modern vestry which occupied the position of the ancient sacristy. Mr. Chalmers has had the modern structure removed, and has fortunately come upon the foundations of the ancient sacristy, which will as far as possible be restored to its original condition.

THE RURAL DRAINAGE PROBLEM.

A MOST important question is raised by Mr. L. A. Lucas, M.A., in a letter to the "Times"—that of the drainage of our country parishes.

This is entirely a new thing, for until the last few years the idea was never heard of. Now the Local Government Board is taking the matter in hand, and is asking the different parishes what they intend to do with regard to the matter. Mr. Lucas suggests that the drainage problem is contained in these two questions: (1) At what point in the growth or development of a parish does a drainage system become necessary? (2) Granted that the parish has developed sufficiently for a drainage system, what kind shall be adopted—drainage by sewer (as in towns), or drainage by vans, known as the Bexley system?

He asserts that the solution of these two puzzling questions is the solution of the whole matter. "With regard to the first question, it is quite certain that a purely agricultural parish would not require to be drained. The squire's mansion, the farmer's house, and the labourer's cottage never caused the question of drainage to be mooted. Each was able to manage its own sanitary affairs. The difficulty starts as soon as houses begin to be built which are without sufficient land to accommodate their own sanitary requirements. A couple of such houses, however loudly they called upon the parish council for sanitary assistance, would certainly not be allowed to plunge the whole of the parish into the expense of a drainage scheme. Would twenty houses be allowed to? Now we are in the very heart of the rural drainage difficulty. What is to be done if a couple of thousand people in a parish do not need drainage and strongly object to it, while twenty or even 200 do need it? The parish in which I live illustrates this state of things. Nearly all the inhabitants of this large agricultural parish are strongly opposed to the introduction of any drainage scheme, while about eight or ten newly-built houses have need of one. I leave it to the judgment of your readers as to whether the whole parish should be burdened with a rate or as to whether those houses requiring sanitary assistance should bear the expense themselves.

"Then as to the second question. Having decided to drain the parish, is it best to adopt the usual drainage by sewer-pipes or the system of sanitary vans, which make a tour of all the cesspools in the parish? I will not labour this point. Experience has shown that once drainage has been resolved upon it is better to drain the place by the ordinary sewer-pipes in use in every town—unless the parish be a very scattered one, in which event sewer drainage would be too expensive, as well as being impracticable, and recourse must be had to the sanitary vans until the population increases and the parish becomes more compact. But the real difficulty of the whole matter lies in the first question: When is a parish to be considered sufficiently developed, or built over, to be compelled to drain itself?"

Change of Address.—Mr. Henry Rose, architect and designer, late of 3, Staple Inn, Holborn, E.C., has just opened an office in Holy Rood Street, Chard, where he will continue to supply designs and estimates for hand-made furniture, &c., and to carry out architects' designs locally by skilful craftsmen.

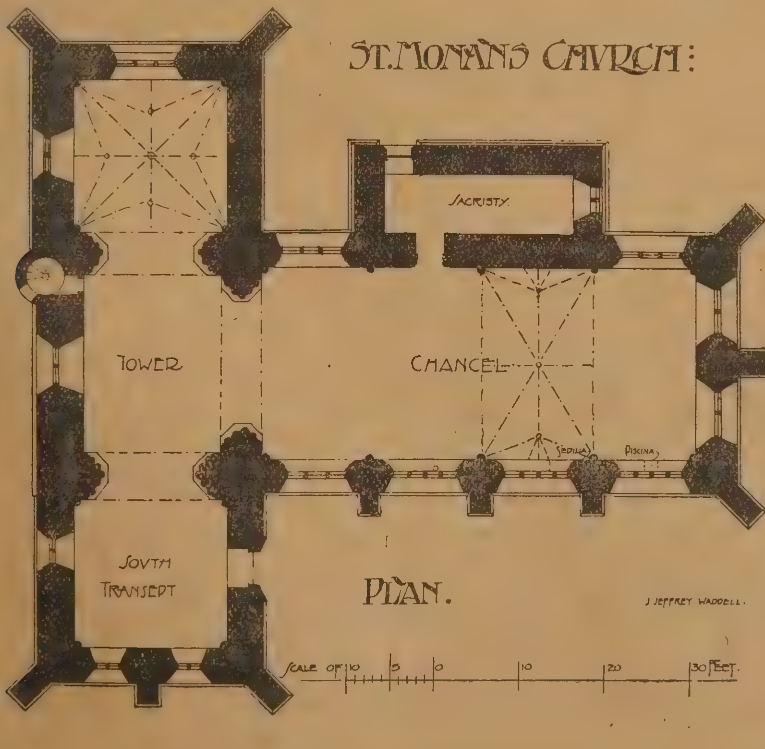
PLYMOUTH'S NEW THEATRE.

A NEW theatre in Plymouth, to be called "The Gaiety," is to be erected. Mr. H. J. Snell, architect, has prepared the plans and specifications, which have been passed by the Special Works Committee of the Corporation without alteration.

Occupying nearly half of the present vacant space, the site has a frontage of 150ft. in Tavistock Road and 124ft. in Tavistock Place, with an average depth of 112ft. It immediately adjoins the lower block of buildings already erected, and directly faces the Technical Schools in Tavistock Road. The new theatre will run longitudinally to the site and parallel with Tavistock Road, the stage being at the north end and the auditorium at the south. Every part of the house appropriated for the audience will have two separate entrances and exits, one opening into the Tavistock Road and the other into Tavistock Place. The main entrance to the dress circle will be at the south-west end in Tavistock Road. Sheltered by a verandah projecting over the footpath, it will have three large openings into a vestibule leading by a grand staircase to the foyer. Both the second circle and pit-stall entrances will be through arcades adjoining the grand circle entrance in Tavistock Road, while the pit and gallery will be entered from Tavistock Place. Seating accommodation will be provided in the pit for 450 persons and in the pit stalls for 330. Each part of the house will have separate retiring-rooms for ladies as well as for gentlemen, and will also have a separate refreshment-room. On the ground floor will be two refreshment-rooms, one at the back of the pit for that part of the house and the other at the side for the pit stalls. The foyer will be an apartment 30ft. by 20ft., separated by large glass doors from a landing of almost equal dimensions. From the foyer there will be three large openings into the grand-circle corridor. Besides the proscenium box, there will be two others at each end of the grand circle. Including these boxes, the grand circle will seat about 176 persons. It is intended to close the grand circle in at the back. The refreshment-room in the south-west corner will be separated from the landing by three pairs of glass doors. In the second circle there will be eight rows of seats and two proscenium boxes, capable of seating altogether 328 persons. Only a low barricade will divide the second circle from the corridor, thus leaving space for a promenade. The refreshment-bar of the second circle will be directly over the foyer, and of the same length but narrower. With ten rows of seats the gallery will seat about 500. In all the theatre will have seating accommodation for about 1,800 persons. Like the rest of the house the gallery will have its own refreshment-room. All the exits from the building will be in excess of the requirements laid down by the London County Council for the Metropolitan theatres.

To enable the audience in all parts of the house to obtain a clear view of the stage, the floor of the pit stalls and pit will be made sloping, with a rise of 6ft. 4in. from the front of the former to the back of the latter, while the second circle will recede two rows behind the dress circle, and the gallery two rows behind the upper circle. Ventilation will be secured by three shafts running up through the roof. The stage will be 60ft. wide, with an average depth of 46ft. from the curtain—practically the same dimensions as the stage of the Theatre Royal. On the east side adjoining the stage will be the scene dock, with entrance for scenery from Tavistock Place. Like the different parts of the auditorium, the stage end of the house will have separate exits for actors and the staff. On the ground floor there will be the manager's private room, business office, waiting-room and three dressing-rooms. Above these will be three other dressing-rooms, with a large dressing-room for female chorus on one side of the house and a wardrobe on the other. On the next storey will be another set of three dressing-rooms, with a large dressing-room for the male chorus. At the back of the stage on this level will be the fly galleries. On the basement under the stage there will be a large house for a gas-engine and a limelight-room. Internally the building will be constructed on the cantilever principle, and within the lines of the seating there will be no pillars to obstruct the view. All the staircases will be fireproof, being built of concrete or stone, while all the openings in the walls between the working part and the auditorium will be fitted with iron doors, and the stage shut off from the rest of the house by a water curtain. Electricity will be used to light the building, with gas as an auxiliary.

The front elevation will be in the modern Renaissance style. Resting on a course of limestone, the main front will be of red bricks with Ham Hill stone dressings, harmonising with the new buildings already erected in Tavistock Road. The centre front elevation will be composed of two wings and lateral pavilions. Both the wings and centre will be recessed, and in the recesses balconies will be placed. In the centre a gable will be flanked by two circular turrets, and each of the pavilions ornamented on the top with a semicircular pediment, surmounted by a dome. At the special request of the Council the front in Tavistock Place will correspond in general character to the elevation of the present houses. The scheme of the decoration has not yet been decided upon, but it is intended to make the interior bright. Tenders are to be invited as soon as possible, and it is hoped that the work will be commenced in about a month's time and the building ready for opening by the autumn of next year.



Law Cases.

A Solicitor's Building Speculation.—At the London Bankruptcy Court last week a sitting was held before Mr. Registrar Pope for the public examination of Alfred Harris, solicitor, of 15, Great Marlborough Street. The debtor attributed his losses to the failure of the petitioning creditors to carry out an agreement with him in connection with a building lease of a piece of land in the Tottenham Court Road upon which he intended to erect shops and flats at a cost of about £90,000. He returned his debts at £4,677, with no available assets. In examination by Mr. Burgess, assistant receiver, the debtor said in 1899, when he entered into the agreement for the building lease, which was offered to him as a good investment, he made an arrangement with a firm of architects to finance him with a view to completing the buildings and selling them to a company. The cost given him was under £100,000, but it worked out at a far larger sum. Nothing was done, and he was sued for over £4,000 for plans, commission, &c. The profit anticipated from the sale of the completed buildings to a company, when floated, was put at from £40,000 to £60,000. His father had undertaken to advance him £10,000. He had since sold the building agreement for £1,250. Replying to the solicitor for the petitioning creditors, the debtor admitted that the petitioning creditors agreed to find £75,000, but that the agreement was to find the total amount required, and their estimate of the cost was insufficient. His counter-claim for £10,000 in the action brought by the petitioning creditors was disallowed and their claim for £4,677 was given against him. The examination was concluded.

PRINCETOWN CHURCH.

ST. MICHAEL AND ALL ANGEL'S CHURCH, Princetown, was reopened recently after having been enlarged and partially reconstructed. Situated close to the convict prison, the church has rather an interesting history. It was built by French and American prisoners of war about 1816. Constructed of rough granite, the old church was a plain though solid building, cold and cheerless within and with scarcely any ornamentation. For some unexplained reason the original builders made all the walls of the same thickness, with the result that while the nave was substantial enough the tower was structurally weak. Some half a century ago the tower had to be braced together by girders, and even now it is not strong enough to carry a peal of bells. Before its restoration the church was in the form of a simple parallelogram about 50ft. long, the width being only 6ft. short of the length. The ceiling throughout was flat, and the four windows on each side had the glass set in strong iron lattice work—to act no doubt as a protection against the wind, which sweeps over the moors at times with tremendous force, and as a safeguard against the escape of prisoners, who formerly attended the church. Before the restoration the building was in a bad state of repair. Nothing has been done to the tower, but the nave has been almost entirely reconstructed, only the outer walls being retained, and the building has been lengthened by 40ft. eastward. The whole of the chancel is entirely new, and in the old part of the building two narrow arcades have been added to form the area into nave and aisles. To accomplish this reconstruction the old roof had to be abandoned, and a new cradle roof has been constructed over the nave, with lean-to roofs for the narrow aisles. The arches are of unusually wide span, the clear space between the piers being 22ft. Both the arches and piers are of Polyphant, and the latter are square with a considerable upward batter. Each bay consists of twin arches boldly moulded, with a space between them, the double arch dying on to the massive piers. Granite would have been preferred by the architect for the arches and piers, and would have been more in harmony with the rest of the building; but the committee found the cost too great, and therefore selected Polyphant. There is no clearstory, but over each column is an oval opening through the wall, which contains tracery. These have a quaint appearance, and give an original effect to the building. In the chancel is a large east window in tracery work, divided into three lights by massive mullions, which give additional strength to withstand the gales of Dartmoor. Unfortunately the ugly side windows have had to be retained, owing to lack of funds to replace them with tracery and better glass. The floor is temporary throughout. It is intended, as soon as funds allow, to add a vestry and organ chamber on either side of the chancel, and the new work has been so treated that this can easily be done without interfering with the main structure. The work has been carried out in a substantial manner by Messrs. Petherick & May, contractors, Lydford, from the designs of Mr. Edmund Sedding, architect, Plymouth, at a cost of about £1,300. Among other objects of interest in the church is an old carved wood pulpit, which was removed from Exeter Cathedral about half a century ago.

Masters and Men.

The Penrhyn Strike.—Signs of a settlement of the Penrhyn Quarry dispute are as remote as ever, and daily fresh batches of strikers are leaving for South Wales, where they find employment in the colliery pits. Strike-pay continues to be received, and the union affirm that they can hold out for a very long time. Inside the quarry work is proceeding satisfactorily, and the quarrymen who have returned anticipated high wages on the monthly pay day.

A Limerick Strike.—Seven members of the Limerick branch of the Amalgamated Society of Carpenters and Joiners were arrested last week on information sworn by Mr. Michael Gough, master-builder, charged with conspiracy, assault and intimidation arising out of the strike of carpenters for higher wages. The complainant alleged that the defendants forcibly took away one of his workmen. They were remanded on bail at the police-court. In connection with the case the solicitors for Mr. Gough have served notice on Mr. Corrigan, delegate of the Carpenters' Society, stating that, following the decision of the House of Lords in the Taff Vale Railway case, the Carpenters' Society would be sued for damages.

Hull Slaters' Dispute.—Conciliation between the Hull Master-Builders and the Slaters' Society seems as far off as ever. A proposed conference has fallen through on account of the Slaters' Society executive committee declining to meet the Hull Building Trades' Federation upon the matters under dispute. The term extended by the masters to allow the men to return to work subject to the newly-formulated code of rules expired on Thursday last. None of the men accepted the ultimatum, and the masters, according to the terms of their published conditions, considered applications from outsiders after reopening the yards. Work in the yards is very slow, and it is doubtful whether business will assume anything like its normal procedure until a conference is agreed upon.

Dispute at Bath.—About a hundred masons and bricklayers employed by Messrs. Jacob Long & Sons, of Bath, left work last week, refusing to labour with five men who have incurred penalties under the Operative Masons' and Bricklayers' Union which they refuse to pay. The men required that they should either pay up or that Messrs. Long should discharge them, and they also demanded that the employers should agree henceforth to employ only society men. The employers of course refused, and called upon the assistance of the Master-Builders' Association, who resolved that unless the strikers returned to work on Friday and complied with the working rules the members would lock out the union masons and bricklayers in their employment. The bricklayers, considering themselves misled by the masons, returned to work, and later the masons decided to follow their example. They began work last Saturday morning, the masters having granted them an extension of time before declaring a general lock-out. The men claim that they are now satisfied to work with the man to whom they particularly objected, he having paid an instalment of the penalties enforced against him by the union, but they admit abandoning the demand that Messrs. Long & Sons should only employ union men in future.

The Barry Carpenters, who came out on strike in May, 1900, for an advance in wages from 8d. to 9d. per hour, have now declared the dispute at an end, and claim that the majority of employers in the district pay the advanced rate. The local Master-Builders' Association, on the other hand, have refused as a body to recognise the advance, and have since that time employed non-unionists at 8d. per hour. The secretary of the latter organisation, who has been entrusted with the contract to erect the new museum and lavatories on Barry Island for the District Council, was recently called upon by the Public Works Committee to pay 9d. per hour as the amount "recognised" in the locality. A meeting of the Master-Builders' Association, after reviewing the circumstances, condemned the action of the Council, and added that they would not increase the carpenters' wages until they could also increase the wages of all the branches of the building trade.

Builders' Notes.

The Additions to the County Asylum, Prestwich, near Manchester, are being warmed and ventilated by means of Shorland's patent Manchester stoves with ornamental tiled sides, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Mr. Thomas Jenkins, a well-known builder and contractor, of Upper St. James Street, Newport, I.W., died recently at the age of sixty-five years. Deceased was a native of Ryde, having removed to Newport in 1879, and taken over the business of Mr. Joseph Poore, which was established in 1826. In consequence of ill-health, Mr. Jenkins took no active part in the business since March or April, 1899.

Carlisle Buildings Collapse.—A party wall in Lowther Street, Carlisle, with premises at the end of Lewthwaite's Lane belonging to Messrs. Clark Brothers, collapsed last week under peculiar circumstances. It seems that between the end of the Lion and Lamb Lane and Lewthwaite's Lane Messrs. J. & R. Bell had been making excavations with a view to the construction of cellars. The ceiling of a tea house was then seen to be cracking, and Messrs. Clark Brothers took steps to have the property professionally examined. The cracks extended and became rapidly wider, and it was deemed prudent to clear all out of the place, including the employees of the Carlisle Rubber Co. Soon afterwards the wall, with the archway, the tea warehouse, and part of the Rubber Co.'s premises, collapsed and fell into the pit which had been dug for the cellars.

Convention of Master House Painters and Decorators.—The eighth annual convention of the National Association of Master House Painters and Decorators of England and Wales will take place at Leicester on the 1st, 2nd, 3rd and 4th prox., under the presidency of Mr. John W. Barker, of that town. The programme is an interesting one, and the meeting promises to be a success. The following papers are announced: Mr. H. Looke, of Hull, on "What to Teach our Apprentices"; Mr. Walter Crane on "Some Thoughts on House-Decoration"; Mr. Fletcher, head-master of the Leicester School of Art, on "The Value of Design and Reticence in Decoration." The annual excursion will take place to Belvoir Castle on October 31st, and the annual dinner will conclude the day at the King's Hall, Grand Hotel, Leicester. All applications for tickets should be sent to Mr. George Bonner, 87, High Street, Leicester.

Partnerships Dissolved.—The partnership subsisting between Messrs. William Henry Parker and Thomas Christelow Barker, as manufacturing joiners, at No. 22A, Concord Street, Leeds, under the style or firm of "Parker & Barker," has been dissolved by mutual consent. All debts due to and owing by the firm will be received and paid by Mr. Thomas Christelow Barker, by whom the business will in future be carried on.—The partnership lately subsisting between Messrs. Albert Riley, John Alfred Riley and Arthur Riley, carrying on business as builders at No. 187, Pentonville Road, in the county of London, under the style or firm of "John Riley & Sons," has been dissolved hy mutual consent as from the 23rd day of August last. All debts due to or owing by the late firm will be received and paid by Mr. Albert Riley, who will continue the said business under the style or firm of "John Riley & Son."

Surveying and Sanitary Notes.

Pavement Uplifted by Mushrooms.—Last week some men on their way to work discovered that the tar pavement in Fitzjohn's Avenue, Hampstead, had been lifted by clusters of mushrooms in no fewer than three places. In each case the patch of tar paving displaced was about 1ft. square. One of the men collected the mushrooms and afterwards cooked them for breakfast. Fitzjohn's Avenue was built on a portion of the well-known Conduit Fields, in which mushrooms formerly grew quite plentifully.

Housing of the Poor.—At the congress of the Sanitary Association of Scotland which has just been held at Paisley, on the motion of Mr. Peter Fyfe, of Glasgow, and Professor Glaister, the following resolution was passed: "That, in the opinion of this congress, no plan for housing the poor in suburban areas or in the country need be attempted until it has been arranged, through legislation or otherwise, for the rates to be charged to the poor for transit to or from the city or town to be so reduced as to make country rents, plus travelling expenses, lower than town rents as at present charged in modern sanitary dwellings."

Engineering Notes.

Proposed New Bridge over the Thames.—At a recent meeting of the Brentford District Council a scheme for erecting a footbridge over the Thames at Brentford so as to provide a better means of access to Kew Gardens from this district and the northern part of the county was introduced, and the following resolution was passed with the addition that the plans should be prepared for the Smith's Hill site: "That this meeting is of opinion that a footbridge over the Thames would be a great acquisition to the town and the northern part of the district, and that the clerk be instructed to obtain such information as may be required, and the surveyor to prepare the necessary plans and estimates."

The Water Supply of Old London.—Argyll Street, Regent Street, is just now up for laying along its centre an electric cable; and many of the ancient wooden water-pipes which did duty in the days before iron was plentiful enough to be used for such purposes, and before there were means of working with the ease of modern times, have been unearthed. These ancient pipes are made of elm trees cut into lengths, with the bark left on, drilled through from end to end and fitted together. Of their age it is not easy to form an estimate. Argyll Street dates back no further than the beginning of the eighteenth century. Sir Joseph Banks was born there in the reign of George II., and in 1811 Madame de Staal was living there in lodgings opposite to Argyll House, once belonging to the Dukes of Argyll and afterwards to Lord Aberdeen, who was living there while Premier at the beginning of the Crimean War. Lord Aberdeen was the last nobleman to live on the eastern side of Regent Street. The house was pulled down in 1865. It seems probable that these wooden pipes, which are in excellent preservation, may be the original water-pipes laid down when Argyll Street was first built, and that they have been lying in the ground some 200 years. It is possible, however, that they may be much later in date, for until within a comparatively late period the subterranean arrangements of London were of a very primitive kind. As lately as 1853, for instance, there was a violent outbreak of cholera in this very district on account of the overflowing of cesspools into a well from which the inhabitants drew their supply of water.

NORTHFIELD CHURCH.

NORTHFIELD, just seven miles out of Birmingham, is one of the many interesting historical and old villages of Worcestershire. The church was said to have been dedicated to St. Michael, but it has recently been shown that St. Laurence is the patron saint; in fact, near the top of the tower on the west side there is a representation of a gridiron, the emblem of that St. Laurence who was roasted over a slow fire upon a huge gridiron. The church is a very interesting specimen of Early English and Early Decorated architecture. The upper portion of the tower is fifteenth-century Gothic. The walls of the tower are said to be 4ft. 6in. thick, and the tower is 53ft. high. The porch is a somewhat large and curious wooden-framed structure panelled in the Decorated style. The old Norman doorway lately removed, and other parts recovered, show some very good specimens of Norman carving. There is a very curious old lead rainwater drip or spout on the south side of the tower about 1ft. 6in. wide and projecting out quite 3ft. The following epitaph is to be found upon a gravestone erected to the memory of "James Sargent, carpenter and joiner, of Bartley Green, who died January 13th, 1799, aged 85 years":—

I was born on Christmas day
My parents was so glad of me
That to the wise men they did go
The nature of my birth to know.
He said that ingenious I should be
So a good trade provide for he
So to the nail block I was set
As if the Lord they meant to fret;
Which I pursued till twenty-three
Then seven years sawing was for me
Then with the plane and other tools
My God directed me to use
For what was offered me to do
My heart and hands could go through.

The lines were written and worked upon the stone by the deceased himself; and on the head of the gravestone are representations of a saw, plane, hammer and other carpenters' tools. There is a churchyard cross, erected at a cost of £300 as a memorial to the late rector (Rev. Henry Clarke, M.A.), which is worthy of inspection. It is built of Hopton stone.

THE DESIGN FOR LIVERPOOL CATHEDRAL.

A SUMMARY OF THE MATTER TO DATE.

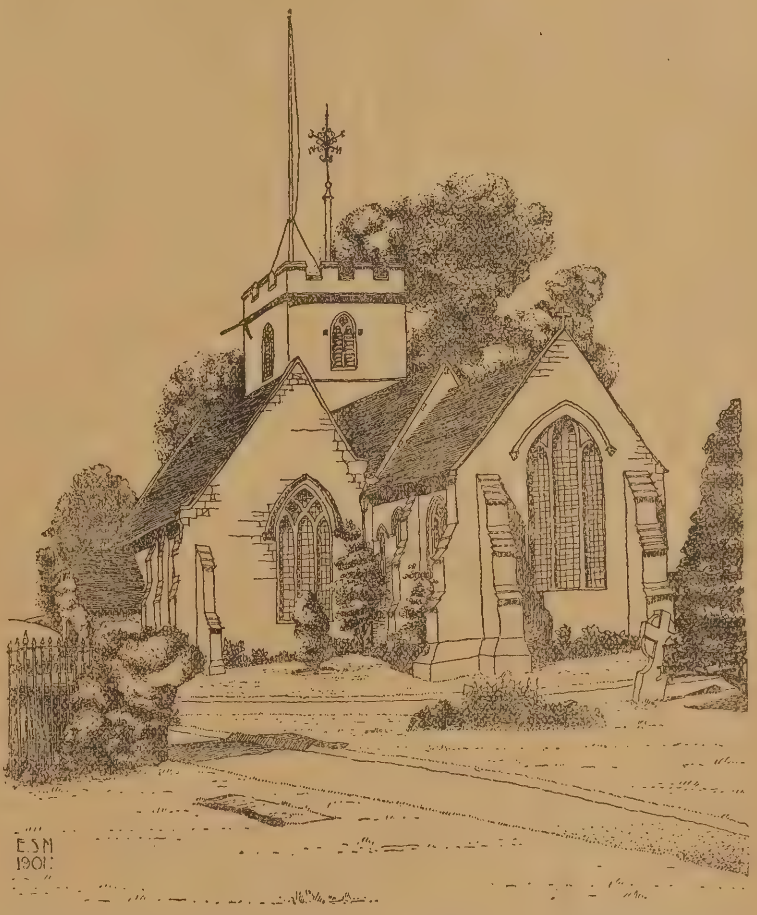
WE have already devoted considerable space to the vexed question of the proposed new cathedral for Liverpool, and in our issue for April 4th, 1900, we published Mr. Emerson's design. A great deal of time has been wasted by the discussion, but we think it will be of interest to draw attention to the summary which Mr. Thomas D. Cutler gives in a letter to the "Liverpool Mercury" and "Liverpool Daily Courier."

In this letter Mr. Cutler recalls the fact that the Liverpool committee invited architects generally who wished to enter the competition for the cathedral to send in for the committee's inspection portfolios of their sketches and designs of work executed. In response about 130 gentlemen (more or less) sent in porfolios. From these 130 the committee selected four to prepare designs for the cathedral—Messrs. Bodley & Garner, Mr. Brooks, Mr. Emerson and Mr. Pearson. Mr. Pearson did not send in a design, but the remaining gentlemen sent in three designs. The late Mr. Ewan Christian was appointed assessor, and in due course sent in his report (which was his award) to the committee. In the summing up of his report he states: "Mr. Emerson's is, in my opinion, on the whole the best." This report was published. Each competitor was paid £300 for his work, which, of course, did not half cover his out-of-pocket expenses.

From unavoidable circumstances, the matter was allowed to drift for fifteen years, through no fault of the architects. Now there is every probability of the cathedral being built. A new site has been selected, and more than £140,000 has already been subscribed, and the committee are now reconsidering who shall be the architect to build the cathedral.

It has been stated that "no actual award was made" by the late Mr. Ewan Christian. "This," says Mr. Cutler, "is a mere quibble of words. The report was the award, and understood as such by the committee."

It has also been averred that none of the three architects were placed or selected by the assessor. The following (taken from his summing up) is a sufficient answer: "You have now before you, I think, a sufficient description of the designs, their merits, and the contrary, as from careful study I have been able to read them. I have avoided, as far as possible, for the purposes of this report, any allusion to minor discrepancies of drawings, &c., not affecting the general question, and all unnecessary technical details, giving only the results of repeated examinations of the drawings and reports submitted by the respective architects, and need not further trouble you on these points, but will add a few remarks on the general subject. You will have gathered from what has preceded that I cannot speak of any one design as perfect in itself; each must be considered as a study, and each has both excellences and defects; and, bearing that in mind, I would say that for careful study of the whole scheme, and for adaptation of the design to meet all necessary arrangements for convenience and construction, Mr. Emerson's is, in my opinion, on the whole the best. Mr. Brooks' plan is very good, but must, I think, yield to that of Messrs. Bodley & Garner in respect of its principal feature and adaptation to modern requirements."



CHURCH OF ST. LAURENCE, NORTHFIELD. DRAWN BY F. STANLEY MITTON.

The opinion has also been expressed that having been in abeyance for fifteen years, therefore there should be a fresh competition. But Mr. Cutler asks, "Why? Mr. Aston Webb's design for the Victoria and Albert Museum was in abeyance for seven years, but the Government never thought of a new competition when they were ready to proceed."

In conclusion Mr. Cutler says: "Admitted that there is a change of site and changed conditions, surely no one will deny that Mr. Emerson is capable of meeting all these changes by adapting his design to the changed circumstances, or, if the committee wish, making an entirely new design. The fact that the committee have been unable to build the cathedral, for which they asked certain distinguished architects to compete fifteen years since, is surely no reason for behaving unfairly, and now when the committee propose to begin the work clearly the only honourable course is to give the commission to the author of the (best) successful design."

In reply to Mr. Cutler's letter another correspondent says that the following is a true statement of the case at the present time:—

(1) A site of contracted area, and consisting of sand and rubble, has been recommended and chosen on the ground of its supposed cheapness.

(2) The public have not been informed what the cathedral is to be in respect of fitness—in size and completeness—nor has it been made apparent that the Cathedral Committee have any definite conception of the matter. Indeed, so far as can be judged by what has transpired, commercial ideas have ruled in their counsels.

(3) Subscriptions towards the building of a cathedral have been given or promised, but the aggregate amount does not reach more than about one-fifth of the probable cost of a cathedral church really worthy of "the second city of the empire."

(4) Will it not be time enough to discuss the question of a design when the intentions and wishes of the committee are more fully and accurately known than they are at present?

The Electrification of the Underground Railway.—Both the Metropolitan and the District Railway Companies are preparing statements to be submitted to the Board of Trade in connection with the electrification of their lines. The Metropolitan Company advocate the application of the Ganz system, while the District Company desire a system on the principle of the underground electric railways already constructed in this country. On the receipt of the two statements the Board of Trade will appoint a committee to adjudicate.

Correspondence.

A School Board Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It is announced that a tender of £10,800 has been accepted by the Gillingham and Grange U.D. School Board for the erection of a new school in the Richmond Road, New Brompton. Plans for the school were recently selected in competition, one of the conditions being that the cost should not exceed £8,500. Have the unsuccessful competitors been fairly treated? Some may have sent in drawings for very cheap buildings who could have done much better had they known that the Board would spend £2,300 more upon the building than they stated they intended to do. There was no public exhibition of the drawings to demonstrate to the competitors the inferiority of their designs to the one selected. In these record-breaking days the speed with which judgment was passed on the fifty-five sets of drawings is worthy of note. The last day for sending in drawings was May 22nd. On the 30th—eight days later—the Board, unaided by a professional assessor, had given its decision. Might it not have been equally satisfactory to the competitors had they limited their work to drawing lots for the modest premiums—one of £10 and three of £5 only? Was there ever before a competition for a £10,800 building so cheaply conducted!—Yours truly,

SWEEPSTAKER.

The Westminster Paving Scandal.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The adoption of the so-called Californian red gum in the principal thoroughfares of Westminster has been ventilated by several correspondents in the "Times," the "Morning Post," the "Daily Telegraph," the "Daily Chronicle," and other journals, and it is as well that the subject should be placed before the public in a concise form in order that a clear and unprejudiced opinion may be easily formed upon the merits of the question.

The letters of the Hon. H. B. Lefroy, the Agent-General for Western Australia, the Hon. Henry Copeland, Agent-General for New South Wales, and others, respecting the above amply deal with the technical, Colonial and national points of view, and we, on behalf of the Ratepayers' Committee of the City of Westminster, propose to lay before your readers the facts which comprise the ratepayers' case.

It will be remembered that in July last public tenders were invited by the Westminster City Council for various street-paving operations, and amongst the other conditions of the specification, clause 16 provided as follows: "The wood blocks to be cut to the exact size of 9in. long by 5in. deep and 3in. wide. Each block to be cut perfectly true in size and shape, the deals being 'dimensioned' if necessary before sawing in order to ensure this." The following firms duly tendered: The Acme Wood Flooring Co., Ltd.; John Mowlem & Co.; William Griffiths & Co., Ltd.; The Improved Wood Pavement Co., Ltd.; E. Nuttall and Edward Alcott.

It appears that the Works Committee, which received the various tenders, referred them for consideration to a sub-committee. This sub-committee, feeling that it had little experience of the American red-gum blocks, recommended that a portion of Piccadilly only should be paved with them, in order that they might be put to an effective test. To the surprise of the sub-committee, when this proposal came before the Works Committee, some of the members championed the American paving with a great deal of feeling, and urged that a large contract be entered into with the firm. Mr. Emden, chairman of the Committee, and other members, strongly opposed this course, and a somewhat heated discussion was conducted for upwards of three hours, the supporters of the American system carrying their point in the end.

A meeting of the City Councillors was held on August 1st last, when the Works Committee stated that they had examined the tenders received in response to public advertisements, and recommended that the tender of Edward Alcott for American red gum and the tender of the Improved Wood Pavement Co., Ltd., for the Swedish deals be accepted, although the Acme Wood Flooring Company's tender for 9in. blocks (which was the size called for by the specification) was the lowest, as the Improved Wood Pavement Co.'s tender was for 8in. blocks. The quantity of timber required for this part of the contract, which is for Swedish wood, amounts to over 900 standards, and the difference in the market value of 8in. deals as against 9in. is £3 per standard, so that the Improved Wood Paving Co. had the advantage of nearly £3,000. Therefore, if the extra £3,000 is added to their estimate, the Improved Wood Pavement Co.'s tender becomes nearly the highest of the whole, instead of the lowest, as represented by the Works Committee.

The Westminster City Council stipulate that any firm shall be disqualified and their tender deemed out of order if it is not in accordance with the specification, and the following extract from page 21 of the agenda of the meeting of August 1st shows that John Mowlem & Co. and William Griffiths & Co., Ltd., were so disqualified: "The tender of Messrs. William Griffiths & Co., Ltd., and Messrs. John Mowlem & Co. are considered to be out of order, inasmuch as they do not provide for maintenance beyond the three years' free maintenance. Apart from this, however, the said tenders are not the lowest for the kind of material it is suggested should be used, and it will be observed that, without exception, the lowest tender of its class is taken."

The evident unfairness of what took place is shown in the sixth paragraph of the same page of the agenda, which is as follows: "The Improved Wood Pavement Co., Ltd., propose to use 8in. blocks instead of 9in. The company in their tender do not guarantee that the creosote oil to be used for the yellow deal blocks shall contain the amount of tar acids specified, and we think it well that acceptance of the company's tender be made subject to the withdrawal of this last modification."

Now the Improved Wood Paving Co., according to the disqualifying rule, should have been ruled out of order for not tendering for 9in. blocks, and the tender for Swedish deals should have been given to the lowest tenderer, namely, the Acme Wood Flooring Co., Ltd., as they and E. Nuttall were the only firms entitled to be considered having complied with the terms and conditions of the specifications. It is here that the good faith of the Council is at stake, and the question arises as to how the firm that violated the rule was not only not disqualified, but their tender actually recommended, although entirely out of order. The Improved Wood Pavement Co. would hardly of their own initiative have tendered for what was not asked or required in the specification.

Therefore, the transaction amounts simply to this. Several eminent firms are asked to tender; one of them privately suggests that some other particular article should be adopted, and the order is given to them. This is manifestly unfair, inasmuch as if 8in. blocks were to be used instead of 9in. as originally intended, fresh tenders should have been asked for from the competing firms. In common honesty, and for the sake of the good name of the city of Westminster, this contract for Swedish wood should be at once rescinded, and given to the firm whose tender was the lowest.

The adoption of American red gum by the Works Committee caused much surprise and astonishment among the members present, one of whom desired the opinion of the surveyor as to the red gum, and his experience of it, but strangely enough the chairman replied that it would be inadvisable for the surveyor to give his opinion at a public meeting. Consequently, this information could not be obtained. The vice-chairman of the Works Committee, Captain Jessell, M.P., on being questioned on the subject, frankly stated that he knew nothing about the red-gum wood, except that it was well advertised and had a good reputation abroad. Even this statement appears not to have the slightest foundation, in fact, as the timber as a paving wood is practically unknown, and is scarcely used, if at all, in the country (America) whence it comes. He also said that there had not been sufficient time to prove its durability. The points had been discussed for some hours by the Works Committee, and on this account he thought the matter should close. This appears to have been all that took place in connection with this important subject; certainly, it did not receive more than ten minutes of the councillors' attention, and they separated for their holidays, no doubt feeling that they had done their duty in handing over upwards of £100,000 of the ratepayers' money in this irregular and slip-shod manner.

The Governments of Western Australia and New South Wales have expended a very large amount of money in introducing and demonstrating the value of Australian hardwoods, and in the English companies which have been formed for the purpose of introducing this wood some millions of English and Australian capital have been embarked. For these reasons everyone should be more or less interested in seeing that Australian wood should have in every respect the preference, especially when it has been demonstrated that it is practically without equal.

A vast number of the principal municipalities in the United Kingdom have for some years adopted Australian hardwoods with the most satisfactory results. Indeed, no complaints were made as to its durability or its evenness when once properly laid until recently, when the surveyor for the St. James's district of Westminster stated that it was wearing in holes in several parts of his parish. Chiefly in consequence of his action, the Australian wood has been discarded in Westminster, but an examination of the foundations, when the wood has been taken up, disclosed the astonishing fact that the unevenness and holes in the roadways entirely arose from one cause alone, namely: that the concrete foundation was bad in the extreme and had given way in every place where the holes had appeared. No wood, however good, could possibly remain even and give satisfaction when laid on such a rotten foundation.

The red gum has only been laid down in a few important places within the last year or two, and this is principally due to the surveyor of the St. James's district before referred to, who without public competition secured its adoption in Pall Mall, Piccadilly, &c. It may, if of good quality, prove a serviceable pavement, but it is quite certain that the class of blocks—sappy and rotten—which have been delivered to Piccadilly, Cavendish Street and Whitehall, cannot possibly stand the rough wear and tear to which they are subjected; and, further, they are not to the specification called for, namely, 9in. by 5in. by 3in., as many of the blocks laid varied in size from 5in. to 10½in. long by 4¾in. to 5⅛in. deep and 2¾in. to 3½in. wide. What sort of pavement can possibly be made with such an assortment of sizes as this, even if the wood was of the best possible quality? The chairman and members of the Works Committee should surely give some attention to these matters and supervise in some manner their officials, who seem to be so wanting in their duty.—Yours truly,

The Westminster Ratepayers' Committee,
A. WESTLEIGH-ELLERTON, B.A.
J. MACCONNELL.

Reed Thatchers.

To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—One of the most successful as well as ambitious examples of modern thatching is to be seen on a somewhat extensive residence upon the cliffs situated at the western end of Exmouth, in this county, known by the modest name of "The Barn." The thatched roofs of this very picturesque building are characteristic of Devonshire, and produce singularly quaint results. The architect under whom the work was recently carried out was Mr. Edward S. Prior, M.A., of 17, Southampton Street, Bloomsbury, W.C., who, I am sure, would gladly give such information about the actual thatchers as correspondents may desire.

I have had thatching done on my own private grounds from time to time, and the following names of a few capable men in this immediate neighbourhood occur to me: John Spencer, Kennford; J. R. Shepherd, Whimple; J. Searles, Clyst Hydon; H. Cumes, Kenton; G. Conway, Exminster; H. Rowe, Exminster; W. Salon, Clyst Honiton; C. Mair, Clyst St. George; B. Hutchins, Westwood Starcross; G. Conway, Exminster; J. Butt, Cheriton Bishop. All these

places are villages in the immediate neighbourhood of Exeter.

The current issue of "Kelly's Directory of Devon" gives the names and addresses of no fewer than 140 professional thatchers resident in this county.—Yours truly, HARRY HEMS.

THE BRITISH ASSOCIATION.

THE annual meeting of the British Association opened at Glasgow last Wednesday with an address by Professor Rücker in defence of the Atomic theory. On Thursday sectional meetings were held. In the presidential address of Major P. A. MacMahon, F.R.S., to the Mathematical and Physical section, he said: In pure science a free interchange of ideas was possible, but in applied physics the commercial spirit exercised an influence. In a recent address Professor Perry had stated that the standard of knowledge in electrical engineering in this country was not so high as elsewhere. It was the duty of the Association to take an active attitude towards this serious blot on the page of applied science. It hindered investigations in pure physics by veiling from observation new phenomena, and by putting out of our reach means of experimenting on a large scale with new combinations. Professor Perry assigned several reasons for the present *impasse*, but confessed that he did not see his way out of the difficulty. It was undoubted that science had been neglected in this country, and that we were reaping as we had sowed. The importance of science-teaching in secondary schools had been overlooked. Those concerned in our industries had not seen the advantage of treating their workshops and manufactories as laboratories of research. The Government had given too meagre an endowment to scientific institutions, and had failed adequately to encourage scientific men and to attract a satisfactory *quota* of the best intellects of the country to the study of science. The country had been lacking alike in science, organisation and in effective co-operation in work. Suggestions had been made to remedy the defects by the construction of royal roads to scientific knowledge. Students had been urged to forego the study of Euclid, and as a substitute to practise drawing triangles and squares, to aim at the collection of mathematical rules of thumb, to leave out of account the knowledge of the meaning of processes so long as they could correctly apply the resulting rules. The advocates of these views were urging a process of "cramming" for the work of life which compared unfavourably with that adopted by the so-called "crammers" for examinations. The awakening of the student would come, perhaps slowly, but none the less inevitably; he might exist for a while on his formulæ and his methods, but with the march of events resulting in new ideas, new apparatus, new designs, new inventions, new materials requiring the utmost development of the powers of the mind, he would find himself hopelessly at sea, and in constant danger of discovering that he was not alone in thinking himself an impostor. In the science to which a man expected to devote his life, the progress of which he hoped to further, and in which he looked for his life's success, there was no royal road.

Specialisation.

At the present time the number of workers was so large, the treatises and scientific journals so numerous, the ramifications of investigation so complicated, that it was scarcely possible to acquire a competent knowledge of the progress being made in the many divisions of science. Hence the so-called "specialist" had come into being. This word was often used as a term of opprobrium or as a symbol of narrow-mindedness. The specialist was declared to be a man who ran after truth in intellectual blinkers, who wilfully restrained himself from observing the work of others and aimed at absolute independence as the one thing to be desired. The proposition might be advanced that all scientific workers were specialists; it was merely a question of degree. An extreme specialist was that man who made discoveries in only one branch, perhaps a very narrow branch, of his subject. But though the subject might be a narrow one, it by no means followed that the appropriate or possible methods of research were prescribed within narrow limits. What was required was not the disparagement of the specialist, but the stamping out of narrow-mindedness, and of ignorance of the nature of the scientific spirit and of the life-work of those who devoted their lives to scientific research. The specialist who wished to accomplish work of the highest excellence must be learned in the resources of science, and have constantly in mind its grandeur and its unity.

In the section of Mechanical Science the president, Colonel R. E. Crompton referred to

Traffic in Streets.

A most important problem in locomotion was that caused by the congestion of street-traffic in our towns and by the undoubted difficulties which existed in carrying our workers to and from their homes in the country to their places of employment in our towns. The number of our working population that used the cycle for going to and from their work was already very large and was steadily increasing. Then came the motor-car. After many years of objecting to the use of the over-head trolley system, our town authorities seemed now to have determined that the only way of relieving street traffic was by an enormous development of electrical tramways. It seemed opportune to point out that a great deal of mischief might accrue from this indiscriminate use of tramways. Of course, where the roads were rough and bad, anything in the nature of a tramway using rails was an improvement on a roadway; but with cities which already possessed well-laid-out and well-paved streets it seemed wrong to break up the surface of these streets for the purpose of laying tramways. Vehicles on the plain road surface could overtake a stopping or a slower vehicle going in the same direction without interfering with other vehicles, but street tramways must stop to set down and take up passengers, and this limited the speed-average and the number of vehicles. In America and on the Continent it was generally admitted that the maximum carrying-capacity of an electrical tramway in one direction was 4,000 passengers per hour past any given point. A full-gauge suburban or metropolitan railway crowded to its fullest extent could not carry more than 12,000 passengers per hour. But with crowded omnibuses almost touching one another and yet going a fair rate of speed, at eight miles per hour, 14,000 passengers could be carried past a given point per hour. It appeared certain, therefore, that although the provision of electrical tramways was undoubtedly an economical means of carrying passengers, yet that these tramways could not be laid in existing thoroughfares without considerably reducing the total road carrying-capacity at times of heavy pressure of traffic, and it appeared likely that either for the daily transport of the workers to and from their homes to places of employment or for taking great crowds out into the country for pleasure purposes, a motor-car service carried out on well-made roads would compete favourably with, and in many ways may be preferable

FERRY AND CLAS, ARCHITECTS.

to, tramway service. The increased road and street traffic and the development of new means of road locomotion had made imperative some modification of our existing system of roadway administration. Cycles, motor-cars, electrical tramcars, had been invented and put on roads maintained and worked exactly as they were seventy years ago at the commencement of the railway era. What was needed was that towns situated on our main through-roads should provide alternative routes, so that through travellers could if they desired avoid the crowded streets of the town. One method of providing such relief roads would be by by-laws providing that all building estates should set aside land for main roads. The building estates which were developed around our great towns never provided a road which could be used as a main line of thoroughfare, but laid out their roads to obtain quiet for those living on the estate. Parliament must take in hand an improved administration of our highways by a comprehensive scheme. Far too many ancient main lines of thoroughfare, already too narrow for the traffic on them, were being blocked by having tramways laid on them. Slow-moving and frequently-stopping vehicles were a cause of congested traffic. A great deal might be done by arranging that during certain hours much of the slower-moving traffic should be shunted into alternative routes, so as to be kept by itself. Motor-cars could safely travel at sixteen miles an hour, and therefore need only take half the time and occupy only half the street-surface that an omnibus did when travelling at eight miles per hour. Such high speeds as these, which were desirable and perfectly safe for motor-cars, could not, however, be obtained unless some regulations were made as to the use of the roadways by foot-passengers.

Foreign Competition.

One of the topics which had been most strongly discussed during the last year had been the position which this country held relatively to other countries as regards its commercial supremacy in engineering matters. A few years ago we were undoubtedly ahead of the world in most branches of mechanical engineering, but owing to the huge development of mechanical engineering in America and Germany we were certainly being run very hard by these countries, and everyone was looking for means to help us to regain our old position. In endeavouring to learn from America we saw that although the workmen in that country received higher wages than here, and although the cost of some of the materials was higher, their manufacturers managed to deliver engines, tools and machinery of all classes of excellent quality at a price which appeared to our manufacturers marvellously low. The chief difference between the manufacturer of America and the manufacturer at home was that, whether it be steam-engines, tools, agricultural machinery or electrical machinery, the American invariably manufactured goods in large quantities to standard patterns. In America work was far more specialised than here, so that a manufacturer as a rule provided himself with a complete outfit of machinery to turn out large numbers of one article. One reason why the American manufacturer had been able to impose on his purchasing public his own standard types, whereas we had not been able to do so, was that very rarely in America did a consulting engineer come between the manufacturer and the user. In America it seemed to be understood by the purchaser that it was a distinct advantage to everyone concerned, both manufacturer and purchaser, that the purchaser should to some extent give way and modify his requirements so as to conform with the standard patterns. On other matters it was quite possible for manufacturers here to combine so as to obtain some standardisation of parts.

On Friday, in the Mechanical and Physical Science section, Dr. Glazebrook, the Superintendent of

The National Physical Laboratory

exhibited plans of the new institution now being erected at Bushey, gave a short history of the building, and described the objects with which it has been founded. The main building consisted of a substantial central block about 70ft. square standing on a vaulted basement. At each corner there was a large wing practically single-storeyed; the rooms in these were being fitted up for various special purposes. In the central building itself would be two general laboratories. There would be a large entrance-hall, arranged as an apparatus-room and a library. The basement contained six rooms of fair size; the floor has been covered with a thick layer of concrete. The walls were very thick, so that they were extremely steady, and the temperature and conditions all favourable for steady work. In addition there were other smaller rooms in the basement; two of these were entirely surrounded by thick interior walls, and arrangements would be fitted to maintain a steady temperature throughout the year. At the back was another wing containing a number of rooms suited for special researches, and there a lift had been fitted and also a mercury column having a height of about 50ft. For the more delicate physical work the ground floor and basement of the old house afforded ample accommodation. For the engineering work a room 80ft. by 50ft. had been built, lighted from the north by a weaving-shed roof. It was divided longitudinally into two bays by a series of rolled steel pillars. The one bay would contain a light travelling crane; along the other ran a line of shafting for driving the machinery and for experimental purposes. Adjoining this laboratory was a drawing office, while the engine-house and boiler-rooms were close at hand. Power, obtained from a 60 kilowatt Parsons turbine, would be distributed electrically to various parts of the laboratories; this form of engine was chosen for the express purpose of avoiding vibration as far as possible. The necessary tools were on order and in course of installation. The work which the committee hoped to attack in the first instance was that which had already been under the consideration of the Alloys Research Committee of the Mechanical Engineers. Apparatus for the photomicrographic examination of steel rails was being set up, and machines for testing the elastic properties of alloys were in course of construction. Pressure gauges and steam indicators would also be tested. The height of the building would not allow the mercury column, now being erected, to measure more than 100lb. to the sq. in., but apparatus was being constructed for pressures in excess of that amount. Considerable attention was to be given to high-temperature thermometry, the testing of platinum thermometers and the measurement of electrical quantities. Before the end of the year the committee hoped the laboratory would be fully and usefully occupied.

In the Engineering section an account of the mechanical exhibits in the Glasgow Exhibition was contributed by Mr. D. H. Morton; and in the Anthropological section Mr. Bosanquet and Mr. Arthur J. Evans read papers on the explorations in Crete.

Sewage and Bacteria Beds.

In the Chemistry section a paper was contributed by Professor E. A. Letts, D.Sc., Ph.D., and Mr. R. F. Blake, F.C.S., F.I.C., on "The Chemical and Biological Changes occurring during the Treatment of Sewage by the so-called Bacteria Beds." It was, he said, generally assumed that the so-called "bacteria beds" acted as oxidising agencies, and that the micro-organisms mainly concerned in the purification process were the nitrifying organisms. If these views were correct, the effluent from the bacteria beds should contain nitrates and nitrites equivalent in amount to the unoxidised nitrogen which disappeared during the treatment. But on examining the results obtained by chemists in investigation on sewage purification it would be found that comparatively small amounts of nitrate and nitrite were produced in relation to the unoxidised nitrogen disappearing. In all probability there were only two alternative ways in which the nitrogen could be lost, by escape in the gaseous state as free nitrogen, or possibly as oxides of nitrogen; or by passing into the tissues of animals or vegetables, the former of which might escape from the bacteria beds, and the latter (and possibly the former also) might remain permanently in the beds. In an investigation the authors found—(1) Practically no oxygen was present, either in the sewage or effluents; (2) the effluents from first contact always contained considerably more carbonic anhydride than the original sewage, and with two exceptions the effluent from second contact contained an excess of that gas; (3) in eleven out of twelve series of analyses the quantity of nitrogen in the effluent was in excess of that present in the original sewage, and generally speaking it was in larger excess in the effluent from double contact than in that from single contact. In all probability only a fraction of the free nitrogen actually evolved would be retained by the effluent, the rest escaping into the air. As regards the possibility that nitrogen was lost biologically, *i.e.*, was absorbed into the tissues of animals or plants which feed on the sewage, there could be no doubt that a portion did escape in that way. The bacteria beds at Belfast and elsewhere swarmed with minute insects (Podura aquatica). These, escaping in myriads, often formed a thick layer on the surface of the effluent which looked like soot. There were also species of worms always present in the bacteria beds in considerable numbers, which no doubt also feed on the sewage.

Dr. S. Rideal said he believed that the main portion of this black soot-like substance referred to was not living at all, but dead inert nitrogenous matter which was formed in the breaking down of the organic nitrogenous substance of sewage, and contained roughly 7 per cent. of nitrogen. Dr. Rideal went on to read a paper on "Humus and the Irreducible Residue in the Bacterial Treatment of Sewage." He pointed out that the loss of nitrogen in bacteria beds which was not accounted for by the cover formed and gaseous nitrogen evolved was in part due to a black humus substance allied to peat, which he had found was formed in all the different methods of bacterial disposal which he had examined. This substance contained 7 per cent. of nitrogen, and was very stable, so that it did not decompose or give rise to any smell even if it was broken.

New Patents.

This patent is open to opposition until October 21st.

1900.— Sewage-Spraying Apparatus.— 16,037, S. H. Adams, Cumbrae, Park Avenue, Harrogate. Instead of one horizontal pipe balanced on a cental axis, two or more revolving sprinklers are used. These sprinklers are attached to a tubular framework which is laid on the filter bed. They are smaller, and revolve faster, than one single large sprinkler. Choking is avoided.

The following specifications were published on Saturday last, and are open to opposition until October 28th. The names in italics are those of communicators of inventions. A summary of the more important of them will be given next week.

1900. — 9,508, Thomson, kilns. 15,861, Liddle, sliding hinges. 16,949, Sellars, machinery for moulding building blocks. 17,719, Foulkes, seats of water-closets. 17,758, Wehinger, wood flooring. 18,632, Potters' Decorative Supply Co., Ltd. (*Michaud*), machine for powdering transfer sheets employed in the decoration of pottery. 18,674, Beggs & Fielding, acetylene gas apparatus. 19,061, Sugg, incandescent gas burners. 19,543, Charlton, pipe couplings, T-pieces and flange joints.

1901. — 5,600, Williams, mechanism for sounding bells. 6,217, Breyer, process for softening water. 6,724, Rosenbusch, facing slabs for suspension on wire netting. 10,170, Walters, renewable seat valve. 10,590, Veritys, Ltd., & Ebbutt, globe holders for street lighting. 11,423, Erath, means for supporting ceilings and insulating damp walls, &c. 13,008, Bollé (*Lugino*), method of erecting walls. 13,136, Helbing, method for producing artificial wood. 13,271, Addison, partitions for schools and other purposes. 13,775, Augustine, wood-graining machines. 13,818, Wuhrmann, machine for parquet slabs. 14,018, Laurenties, dies for brick presses. 14,240, Clark (*Atlas Machine Co.*), stone carriers for stone-grinding and polishing machines. 14,920, Olson & Opland, combined slide gauge and T-square. 15,033, Pickles & Jones, cross-cut stone-sawing machine.

SOUTH KENSINGTON EXAMINATIONS IN BUILDING CONSTRUCTION.

THE REVISED SYLLABUS.

IMMEDIATELY after the examinations of the Board of Education held last May several of our readers sent us letters, which we printed, complaining of the papers that had been set. In any controversy as to the character of questions, students are at a great disadvantage. Students are the material worked upon by the teacher and examiner, and in the view of some they are mere clay in the hands of the potter. This is by no means a correct view. Students are not, however, except to a limited degree, in the position of critics, though they may be allowed to cry out when hurt or dealt with unfairly.

The critics worth listening to are those who have passed the ordeal of teacher and examiner—the finished article so far as school work is concerned—who can find time to give us their views in regard to school work and its connection with the actual work which we call practice. The teacher and examiner should be able to regard both the pupil and the man in practice; his business is not to make a vessel of clay, but it is rather that of teaching young birds to fly, and he will be the better fitted for this work if he can do some flying himself. The teacher and examiner should be in some degree a practical man, and perhaps the greatest educational difficulty we have lies in the disinclination of the practical man to teach or to write books.

From time to time we give space for samples of criticism of the kind suggested. The pungent address of Mr. Bulkeley Creswell to the Birmingham Architectural Association (see our issue for May 29th last), though (as he suggests himself, where he refers to a friend "who does not altogether agree with the views I have just put forward") its dogmas are not absolutely necessary for professional salvation, contains much which deserves consideration. Some young people may be encouraged by the result of the interesting personal experience of education there set forth to have the belief that after all there is a "royal road," that the schools with their skin and other troubles are worse than useless. Mr. Creswell does not mean this—a man has to learn his profession somewhere; he only contends that the methods of the schools need reform and that much of the matter might be exchanged for more useful matter. The very great diversity of the human being as a teachable thing is not sufficiently recognised. In our issue for June 19th last we published a report of Professor Lethaby's paper before the Royal Institute of British Architects, and in the same number an "American View" by Mr. Russell Sturgis.

Why is it that our text-books and examination papers are archaic? It may be denied that they are archaic, and it may be pointed out that every modern thing we can name is taken account of and dealt with in these papers and books. Modern methods are no doubt exhibited, but the whole skeleton is ancient and the soul is more than half a century old. Iron and Portland cement are of course mentioned, and a good deal is said about them; but the enormous changes in building methods effected by the modern use of these materials are very imperfectly shown. Diagrams of ancient "framed floors" are still used for the instruction of students in the elementary stage. Elaborate drawings of bonding of bricks can be made (diagram instruction) by pupils who cannot explain what is the proper relation of the length to the breadth of a brick.

The proper use of formulæ is not well-known. Actual numerical examples are not often worked, and any set of examination papers will show the most absurd results from the application of formulæ. Not occasional absurdities—the absurdities are general, and the correct answers are very rare. We have had experience of an examination in which for a certain question 90 per cent. of the candidates thought it necessary to write down $\mathrm{BW} = \frac{Cad^2}{l}$, where BW is breaking weight, C a constant for material, &c., a breadth, d depth, and l length of a beam. In no case did anyone get the correct answer, there being an almost uniformly graduated range from 200lb. to over 2,000 tons as a safe load upon a given beam.

Formulæ and diagrams need some kind of soul breathed into them. The formula or the diagram must be the expression of an idea. We might go on to considerable length with these views and instances; the occasion which suggests them is the approaching session of evening classes in preparation for the examinations to be held next May under the Board of Education. We print below the Revised Syllabus for Building Construction, and it will be noticed that important changes have been made. Hitherto questions on framed floors, roof trusses, complex bonding of bricks, &c.—matters not in themselves elementary—have been brought into the elementary stage mainly as examples of drawing. The new syllabus in some degree makes the stages follow the natural order of the subject: the elementary stage will deal with elementary building, and so on.

We believe we can assist teachers and students in their work, and we have arranged for a series of articles on building construction. The first of these articles will appear next week.

SYLLABUS.

Subject III.—Building Construction.

A larger number of questions will be set in the examination papers than the candidate will be allowed to attempt, so that he may have some range of selection of questions which bear upon branches to which he has given special attention.

A student of this subject must be a draughtsman: he should be able to show definitely by drawings what he intends to have carried out, and he should be able with readiness to explain details of construction by drawings and sketches: in the several stages he will be expected to show proficiency both in finished drawing and what may be called descriptive and explanatory drawing. He should know the most usual methods of multiplying drawings and copies of quantities as practised in architects' and builders' offices. He should practise sketching approximately to scale, and for this sketching paper ruled in faint squares is recommended. It is to be noted, however, that the subject of examination is building construction and not abstract drawing. Questions will be set which will not require drawing: in many cases time will be saved by the examiner specifying sketches to scale, on squared paper and otherwise. The knowledge of drawing assumed includes the use of the usual drawing instruments, scales, various ways of laying-down angles, applied projection (isometrical included) and perspective.

The standard of drawing will naturally be higher in the higher stages. Questions may be put which will specially test the candidates' neatness and accuracy in inking-in curves, and straight lines meeting curves, &c. The student is recommended to practise neat plain lettering and figuring.

Elementary Stage.

The candidate should know—how a pull or a push of so many pounds may be represented in direction and magnitude by a straight line, and how three forces in one plane in equilibrium, at a point, may be represented to scale and are parallel to the sides of a triangle; the weights of water and iron, and approximately of other materials used in building; the meaning of stress per sq. in. (or sq. ft.); roughly the safe loads for common materials; about mortars, quality of good sand, Portland cement, limes; about slates and roofing tiles, and modes of fastening; about concreting in floors, roofs, walls, &c.; plain floor tiling, spacing of joists, rafters, &c.; plain carpentry and joinery—trimming-joists and rafters, usual scantlings of timber proportions of doors, doors, windows, floors, skirtings, simple trimmings round doors and windows; elementary ventilation and warming; bonds of brickwork; varieties of rubble masonry; plain plastering; plain painting and glazing; easy plumber's work; ironwork—locks, hinges, fastenings, grates, rainwater pipes and gutters, &c.; elementary drainage connections with sewers and cesspools.

The bulk of the questions will have to do with elementary buildings, say labourers' cottages and artizans' dwellings.

Questions will be set to test the powers of direct observation of the student, and he is recommended to miss no opportunity he may have of inspecting buildings in process of construction.

Advanced Stage.

The questions set in this stage shall be designed to test advanced knowledge of the subjects enumerated for the elementary stage. The bulk of the questions will apply to buildings up to and inclusive of town houses of £100 valuation, country villas, ordinary shops and medium-sized warehouses.

The student should know—how to draw diagrams of stresses for roof trusses and simple braced girders with simple gravitation loads; how trusses of wood and of iron (or steel) are put together (spans up to 40ft.); the use of rolled joists, weights and strengths of stock sizes, the bearing of beams on walls; connection of woodwork to walls; to find the bending moment at any part of a beam under any system of gravitation loading (beam supported at both ends); what is meant by moment of inertia of a cross-section; Young's modulus; combinations of iron (or steel) and Portland-cement concrete, concrete roofs, fireproof construction; to test Portland cement; varieties of timber, sources and characteristics; well-known building stones, bricks and building materials generally; how to take rough quantities for estimating.

Questions will be set in—excavation for foundations, sewers, &c., timbering, piling, concreting, framing, nature of soil, &c.; damp-courses; exclusion of vermin; dampness of site; connection of walls with ground, &c.; purpose-made brickwork, terra-cotta, artificial stone, &c.; stone-cutting, various dressings for quoins and ashlar, stone stairs, &c.; slating—sizes and qualities of slates, hips, valleys, fancy slating, creasing, shelves, cisterns, sinks, &c.; advanced carpentry and joinery — panellings, stair building, &c.; casement and French windows, wainscottings, window trimmings, &c., &c.; asphalting, sound-deadening, ventilation, hot-water supply, heating, gas and electric supply, water supply, lightning conductors, preservation of iron, timber, &c.; lead, &c., lights in wood frames and in stone ones; various kinds of glass and glazing; ranges, grates, mantels, fastenings of all kinds; furniture of doors, &c.; bells; painters' work of all kinds; advanced plumbers' work—soil pipes, ventilation pipes, connections with sewers, traps, inspection chambers, water-closets, baths, sinks, flashings, flats, gutters, valleys, &c.; scaffolding; shoring and strutting; effects of wind and rain on buildings, &c., &c.

Honours.

The Honours examination will be divided into two parts, which cannot both be taken in the same year, and no candidate who has not been successful in Part I. can be examined in Part II. A certificate or a medal will only be given when a success in Part II. has been obtained.

Part I.

This course will include buildings of all kinds and sizes. The student will be expected to show that he can practically apply principles of physics (mechanics, chemistry, &c.) in building construction. He should be able to design roof trusses and beams of every kind; to draw stress diagrams of trusses under every kind of loading; to calculate the thrust of arches, and provide for every kind of stress at every part of large buildings; to understand the method of taking quantities; and he should know something of relative and approximate prices of work and materials, to explain in a rational way the mode of manufacture of important building materials—cement-making, brick-making, quarrying, &c. He should be able to describe tests for every kind of important building material. He should be able to answer questions showing an intimate knowledge of all the matters enumerated for the lower grades.

Part II.

This course will include questions on the history of architecture; the candidate will be required to show by sketches and drawings that he has an accurate knowledge of notable examples of architecture. It will also include the subject of specifications.

The examiner will have in mind in setting the questions the actual practice of architects in designing buildings and in their management of assistants and clerks of works to ensure that their orders will be properly carried out;

the dealing with contractors, and also the actual carrying out of works under direct management. Candidates will be asked to make sketch designs and give instructions to draughtsmen for careful scale-drawings and specifications. The questions may deal with any part of the subject and with any kind of building whatever.

Those candidates whose answering of the paper is sufficiently satisfactory will be summoned to South Kensington for a practical examination. This further examination will be held on one or more days—the time will not not exceed seven hours each day. Candidates will be asked to design a building suitable for a definite purpose, and they shall be required to give such plans, elevations and sections, and such details and notes for a specification, as shall be required by the examiner. An estimate of cost will also be required.

Candidates must provide T-squares, set-squares, drawing instruments, ink and colours. Drawing paper and drawing boards will be provided by the Board of Education.

No candidate can be classed in Honours who is not successful in the practical examination.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Liability to Keep House in Repair.

LONDON.—Z. Z. writes: "Under the following clauses from a three years' agreement relative to the letting of a suburban house at £50 rental per annum—(1) Can the landlord be compelled to replace during the tenancy a defective hot-water cistern which leaks from small holes, probably due to the material having perished by condensation? The cistern was not new at the commencement of the tenancy. (2) The landlord fails to reasonably repair and keep up his property, and the external ironwork is gradually perishing for want of paint, and was in this state before the tenancy referred to commenced. (3) Wallpaper in a bathroom has perished and is falling from the plastered walls, and the plaster (due to bad material) falls out as well. Can the landlord be called upon to execute these repairs (2) and (3), or must the tenant? The clauses in the agreement are as follows: 'The *tenant* agrees to keep the interior of the house and premises (except as hereinafter mentioned), together with all the glass in the windows and all water-pipes and taps and the fittings and things thereto belonging, and all locks, keys and fastenings and other fixtures and things therein, in good and sufficient repair, order and condition. To deliver up the house and premises, together with all the fixtures and fittings, at the expiration or sooner determination of the tenancy in such good and sufficient repair, order and condition (reasonable wear and tear and damage by fire excepted). And the *landlord* agrees with the tenant as follows: To keep the roof and outside walls wind- and weather-tight and the main walls and timbers in good structural repair and condition during the tenancy.' "

The landlord is only bound to keep the premises wind- and weather-tight, and to do structural repairs to the main walls and timbers; hence he cannot be compelled to (1) replace a defective hot-water cistern or (3) make good the wallpaper in the bathroom, or to restore the the plaster of the plastered walls. As to (2), the question is somewhat vague, but unless the failure to repair amounts to a failure to keep the premises wind- and water-tight, the landlord cannot be held liable. The tenant is only liable to do internal repairs, and therefore has nothing to do with the external state of the premises. He is, however, liable to keep the place in proper condition, and therefore to repair the plaster in the bathroom and re-paper the same.

The Sanitary Institute Examinations.

ALRESFORD.—H. G. writes: "What is the address of the Sanitary Institute? What subjects are necessary for their inspectors' examination, and also what text-books would you recommend?"

Write to the secretary of the Sanitary Institute, Parkes Museum, Margaret Street, W. The Institute publishes a list of books in the syllabus of the examinations.

A Question of Light.

BANGOR.—CYMRO writes: "In altering my business premises, I intend to form a large window between the present window and door. At the side of the latter is a passage leading to some cottages, and immediately opposite is an old graveyard. I am informed that the trustees of the graveyard can prevent me enlarging the present window, as I shall thus create a new light. I enclose sketch (not reproduced)."

The trustees of the graveyard would be at liberty to erect on their own premises an obstruction to any actual new light within nineteen years and a day of its creation; but if, in order to block the new light, they also blocked the old one, they could be forced to remove the obstruction. Records of what is done should be carefully preserved and properly verified, giving both the present condition of affairs and the condition after alteration. It would be best not to alter the present window frame at all, nor to shift its position in the least. G. A. T. M.

Dry-Rot Fungus.

WINDERMERE.—R. W. W. writes: "About twelve months ago the floor of a coach-house which I built three or four years previously showed signs of decay, and when a few boards were removed it was found to be in a very bad condition, being much eaten away by dry rot or some other equally destructive parasite. The floor was re-laid and more ventilation given, but now a fine powder of a reddish-brown colour comes up at the vent grids and covers the tops

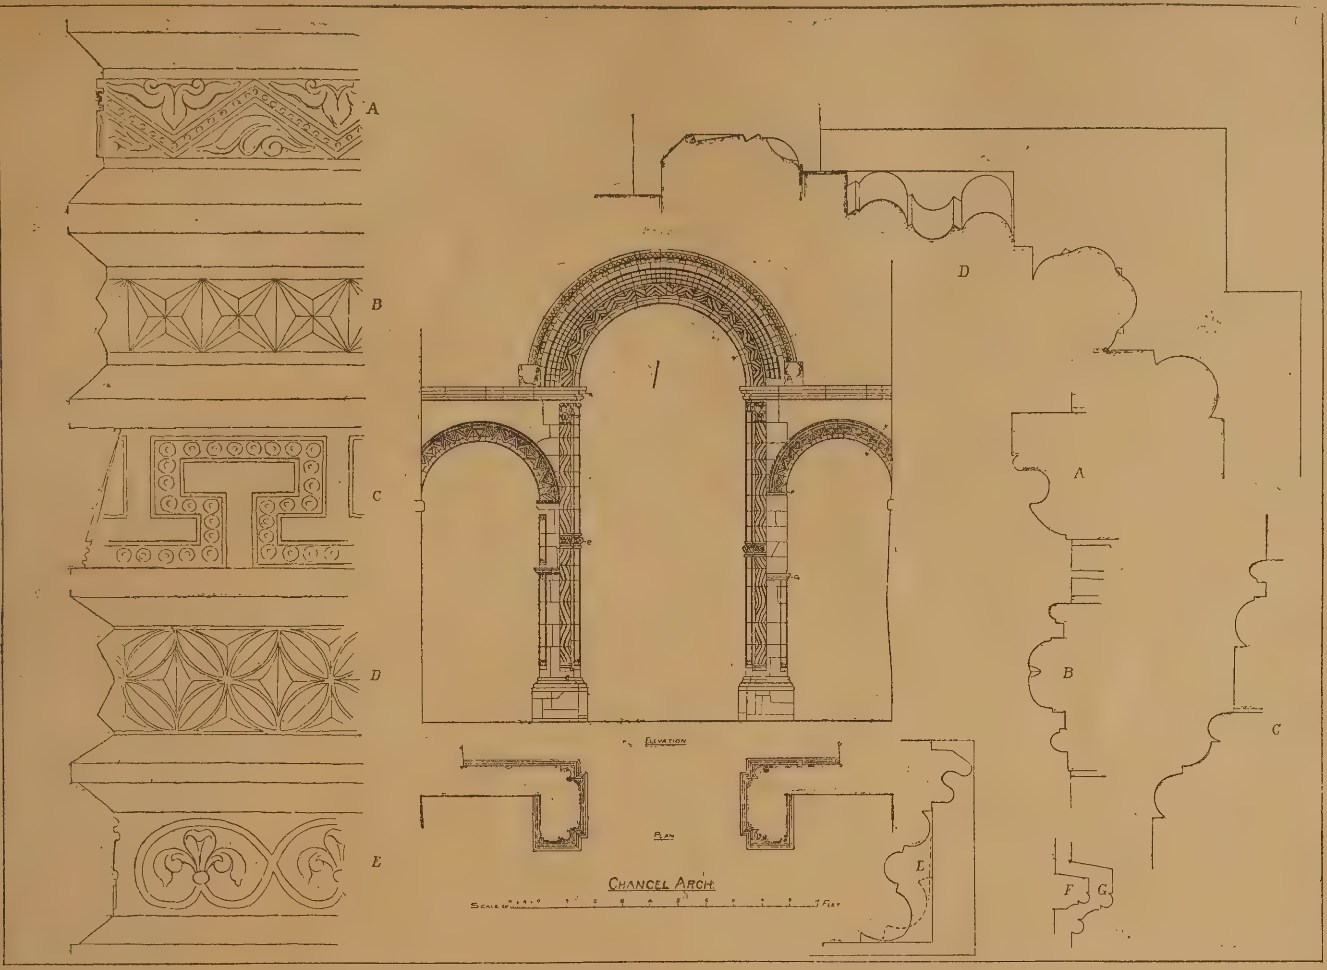
BARFRESTON CHURCH, KENT. MEASURED AND DRAWN BY J. F. DUTHOIT, A.R.I.B.A.



BARFRESTON CHURCH, KENT. MEASURED AND DRAWN BY J. F. DUTHOIT, A.R.I.B.A.

of the carriages, cushions, &c. This powdery stuff (of which I send a sample) has been examined under the microscope, and the cells seem to be perfect. Can you tell me what the fungus peculiar to dry rot is like, and will it live in a dry well-ventilated place? There is a clear air-space of 12in. below the floor joists."

We have had the powder microscopically examined in the laboratory of Professor Bayley Balfour, Regius Keeper, Royal Botanic Gardens, Edinburgh.

It consists principally of fine pieces of wood in high state of disintegration, together with the spores of the dry-rot fungus. It is of the highest importance that the spores should be got rid of immediately—since they will not only renew the trouble in the coach-house, but from the cushions of the carriages they are certain to be conveyed on the occupants' clothes into other houses (wardrobes, &c.), with the result that very serious damage is sure to be done in other buildings. Further, spores in such abundance as to form a perceptible layer of dust are highly undesirable things to inhale. It is a very difficult matter to recommend a simple remedy. The best advice to follow is that given by R. Hartig at p. 75 of his work on "Der Achte Hausschwamm." As regards the appearance of the fungus peculiar to dry rot, the most striking features are the long ash-grey strands formed by the mycelium and the spongy-like fructifications which become dark-brown with age. A very good description will be found in the above-mentioned work.

Right of Way over Land.

W. G. writes: "I bought a piece of land large enough for fifteen houses with a frontage of 15ft. each. I built eight houses, and sold the remainder of the land. When I did this I agreed to allow the purchaser to use the entrance of my back street. He afterwards bought the adjoining piece of land and built eleven houses on it, using my entrance. Can I compel him to make an entrance for these eleven houses?"

No particulars are given as to the general situation of the houses and land, but as an expression of opinion it is considered that under the circumstances the adjoining owner may reasonably claim a right of way over the back street for the tenants of his houses. T. E. C.

Fonts in West Country Churches.

EXETER.—DEVONIAN writes: "Kindly give a list of churches in the West of England where I could find some Early English and Decorated fonts."

I am not aware of any first or second Pointed fonts near here (Plymouth). They are rare in these parts. EDMUND SEDDING.

Patent Glass Lights.

NEWCASTLE-ON-TYNE.—B. P. writes: "Can you recommend some kind of patent glass lights that will really light up a passage about 30ft. long by 5ft. 6in. by 10ft.? It has a window of about 5ft. super. at one end, but the other end is very gloomy. Can you recommend a good book on architectural book-keeping and practice generally, and a really lucid work on the construction of stone vaults?"

We recommend you to apply to Messrs. The Union Plate Glass Co., Ltd., of Pocket Nook, St. Helen's, who make "Refrax" glass; Messrs. Wilson & Co., of Harrison Street, Gray's Inn Road, W.C., who also make prism glass; and Messrs. P. E. Chappuis & Co., of 69, Fleet Street, E.C., patentees of the well-known Chappuis' reflectors. There is no practical book on architectural or builders' bookkeeping. For works on stone vaults see answer to enquiry under heading "Scientific Masonry" on p. 11 of our issue for August 21st last.

Cause of Stone Window Heads Cracking.

COVENTRY.—A CONSTANT READER writes: "I enclose a sketch (not reproduced) of a house. The stone heads, which are 9in. by $4\frac{1}{2}$in. best box Bath-stone, have both cracked right through. The windows have 4ft. 6in. openings. Kindly suggest some cause for the cracks. The contractor contends that the whole weight of the gable is on the two points fractured, and that the stone was not sufficiently strong; but I am of opinion that the stone is of sufficient dimensions to carry the weight, and that a relieving arch should have been constructed at the back of the head over the lintel."

The builder is right; the masonry between the ground-floor windows has comparatively only a small weight to carry, having voids directly over it, and consequently it does not settle; but outside the weight of the whole of the masonry comes upon the heads, causing the parts directly beyond the vertical line of the oriel to settle and crack at this vertical line. You should have shown relieving arches over the lintels on your plans. The builder should not be blamed; if you intended him to take the responsibility you should have given him a free hand in the design. You can prevent a repetition by using relieving arches over the lintels or steel girders for lintels. In the latter case you must take care that the stone heads are free from any load which would cause them to give at all, by putting the lintels above the heads on section, still keeping them from showing on the face.

The Institution of Junior Engineers.

LONDON, S.W.—C. B. C. writes: "How can I become a member of the Institution of Junior Engineers?"

Write to the Secretary, Mr. Walter T. Dunn, 47, Fentiman Road, London, S.W.

Liability to Repair Drains.

BRIGHTON.—PINDAR writes: "In a certain lease for twenty-one years the lessee covenants to keep both the inside and outside, with the fixtures and glass windows, in good condition and tenantable repair (damage by fire excepted); and at the expiration or sooner determination of the term to yield up the premises in good condition and repair, and in fair and proper order (damage by fire excepted). The lessor covenants before February 1st then next to put the premises in good and tenantable repair and condition both internally and externally. The drains at the house have recently been found defective, and the lessee instructed a builder to repair them. The builder reported that almost all the pipes were unsound, being of obsolete pattern. The lessee applied to the lessor repudiating liability for anything beyond repairs. The lessor told the builder to repair only, but notified lessee that at the expiration of the lease drains would be renewed. The lessee has again repudiated liability to reconstruct, and points out that the lessor could not claim better drains than originally existed; also that he (the lessee) is not even liable to leave drains *as good* as they were originally, as these clauses have been held to allow 'wear and tear,' although the words 'wear and tear' are not mentioned. Is lessee right in his contention? Can you recommend a really reliable and up-to-date book on dilapidations?"

The lessee under his covenant is only bound to keep the drains in good order and repair, and thus maintain them in a similar condition to that generally obtaining at the commencement of the lease. It is therefore considered that the lessor cannot call upon the lessee to entirely reconstruct the drains, so as to leave them in a better condition and state of repair than they were at the time of obtaining possession. Some valuable information respecting "dilapidations" will be found in No. 4 of "Specification," published at these offices, price 5s. nett. A long paper on the subject by Mr. W. J. Jennings, F.S.I., appeared in the BUILDERS' JOURNAL for March 27th last.

T. E. C.

Cost of Statues.

LONGTON.—J. J. writes: "What would be the approximate cost of a draped statue 10ft. high by 5ft., executed in bronze, marble, granite and stone?"

The question is too vague for us to give anything more than the most nominal approximate cost. The cost of the design of the statue will of course depend upon the standing of the sculptor, and will range to any amount from, say, £15. The cost of pointing and finishing and of the material of a statue 10ft. high by 5ft. wide, inclusive of pedestal, however, can be roughly estimated at about £150 for bronze, £350 for marble, and £85 in a soft easily-worked stone, but the cost will vary very considerably, according to the amount of finish put on the work, the prices we have given being the lowest for work that is fit to be seen. Of course, a bronze statue is only a thin sheathing of this alloy. The model for a metal statue will cost more in proportion, as it has to be finely finished for moulding. A marble statue requires a greater finish than a stone one, and as it would in all probability only be used for interior work close to the eye it would require more careful finishing than stone. Granite is hardly ever used for statuary; it is a most difficult, tedious, and expensive material to work. In Egypt, the proverbial country of its adoption, it was almost exclusively carved in very low relief, the statues in granite being generally colossal, and considerably conventionalised to suit the material. But of course the Egyptians were unmindful of labour, as they had plenty of slaves.

Copies of Rural By-laws.

BY-LAW writes: "I should be glad to know whether or not a person intending to erect certain buildings for which he must submit plans to the local authorities can legally demand a copy of that authority's by-laws. About eighteen months ago, having occasion to submit plans to a certain rural district council, I wrote to the surveyor asking for a copy of his council's by-laws. I was told 'that the by-laws were out of print, and that there were no spare copies left, but I might peruse *his* copy at *his* office.' This I was obliged to do, although his office is twenty-one miles by rail from my own; and I am still unable to get a copy for the same reason. I have had a similar experience with another authority."

Strange to say, local authorities are under no specific obligation to even print their by-laws. The only course to adopt is to complain to the Local Government Board; while, if an action results for infringement at the instance of the local authority, the fact that no copies of the by-laws could be obtained, though demanded with the full intention of complying with them, would be a material point in defence.

G. A. T. M.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Show me the back windows of a man's dwelling and I will tell you his character. The rear of a house only is sincere. The attitude of deception kept up at the front windows, leaves the back area defenceless. The world enters at the front door, but nature comes out at the back passage.—BRET HARTE.

Our Plates. IT is seldom that any record of the erection of a rural church is met with, and in this respect that of Barfreston is no exception to the rule. Situated in the midst of a tiny village about six miles from Dover, it is a small but exquisite specimen of late Norman workmanship. At the Conquest the manor came into the possession of Odo of Bayeux, but there is no mention of a church in the Doomsday Book. One writer has suggested the church was erected at Hackington, near Canterbury, in 1185 by the Archbishop Baldwin, and was pulled down again and re-erected here. The hunting scenes sculptured upon the arch stones to the south door have given rise to the legend that the building was the outcome of a hunting vow by a noble of the district, but it is never met with in any authentic form. The church consists of an oblong nave and chancel; the axis inclines to the south-east, and the walls are very far from being at right angles to one another. The proportions are striking: the length of nave 26ft. 10in., the width of the nave 16ft. 8in., the length of chancel 16ft. 8in. (the width of nave), and the width of chancel 13ft. 8in. (half the length of the nave). Opening into the chancel is a lofty and richly-moulded arch with wavy fluted pillars to jambs, with an arched recess on either side; the windows are bonnet-shaped, with deep splays with moulded jambs and labels, and the wheel window to the east end has every stone making up the arch carried with grotesque figure and ornament. Externally the church is of very rich design on the three sides (the north being quite plain) and built of flints to the string-course above of dressed freestone, with recessed arcades pierced with very small round-headed windows finishing with a corbel table supported on corbel stones carved in grotesque faces and subjects. The roof is tiled. The east end has below its windows three buttresses connected together by segmental arches forming two recesses. The circular east window is a very fine example; it is divided into lights by mullions shaped like columns with grotesque heads and capitals. The lights are trefoiled, and surrounded by circles every stone of which is carved with grotesque animals and subjects and ornamented by a rich label mould. In so small a building it is remarkable that there are three doorways; and the south door, which is the chief glory of Barfreston, is counted as the finest example of the work of the period.

The Holborn Workhouse. IN the course of the modern London improvements the old Holborn Workhouse, with its queer, prison-like yard, will shortly disappear from the Gray's Inn Road. The old building has long survived as a reminder of the old days of Oliver Twist, whose trainer in evil doing, Fagan, had his abode in Saffron Hill, hard by. The removal of this "pauper's paradise," as this particular workhouse has been ironically termed, is a welcome sign that the portion of the Gray's Inn Road to the north of Holborn Town Hall will receive the same improvement that has already been accorded the southern section. Hardly any main thoroughfare has changed so little for the better during the past fifty years as this busy and crowded highway between King's Cross and Holborn Town Hall. Shabby stables and ugly manure heaps face the windows of the Royal Free Hospital, near which the only signs of improvement of late years has been the converting of a couple of the neglected graveyards into pleasant recreation gardens. One of these, by the way, situated to the west of the main road, contains the tombs of Anna, granddaughter of the great Oliver Cromwell, and Zachary Macaulay, father of the famous historian. These memorials in the garden of St. George the Martyr are scarcely known to one Londoner in a thousand, but the curious old workhouse is a familiar eyesore, and must have often met Dickens's eyes as he strolled down the Gray's Inn Road from 40, Doughty Street, where he so long lived and worked.

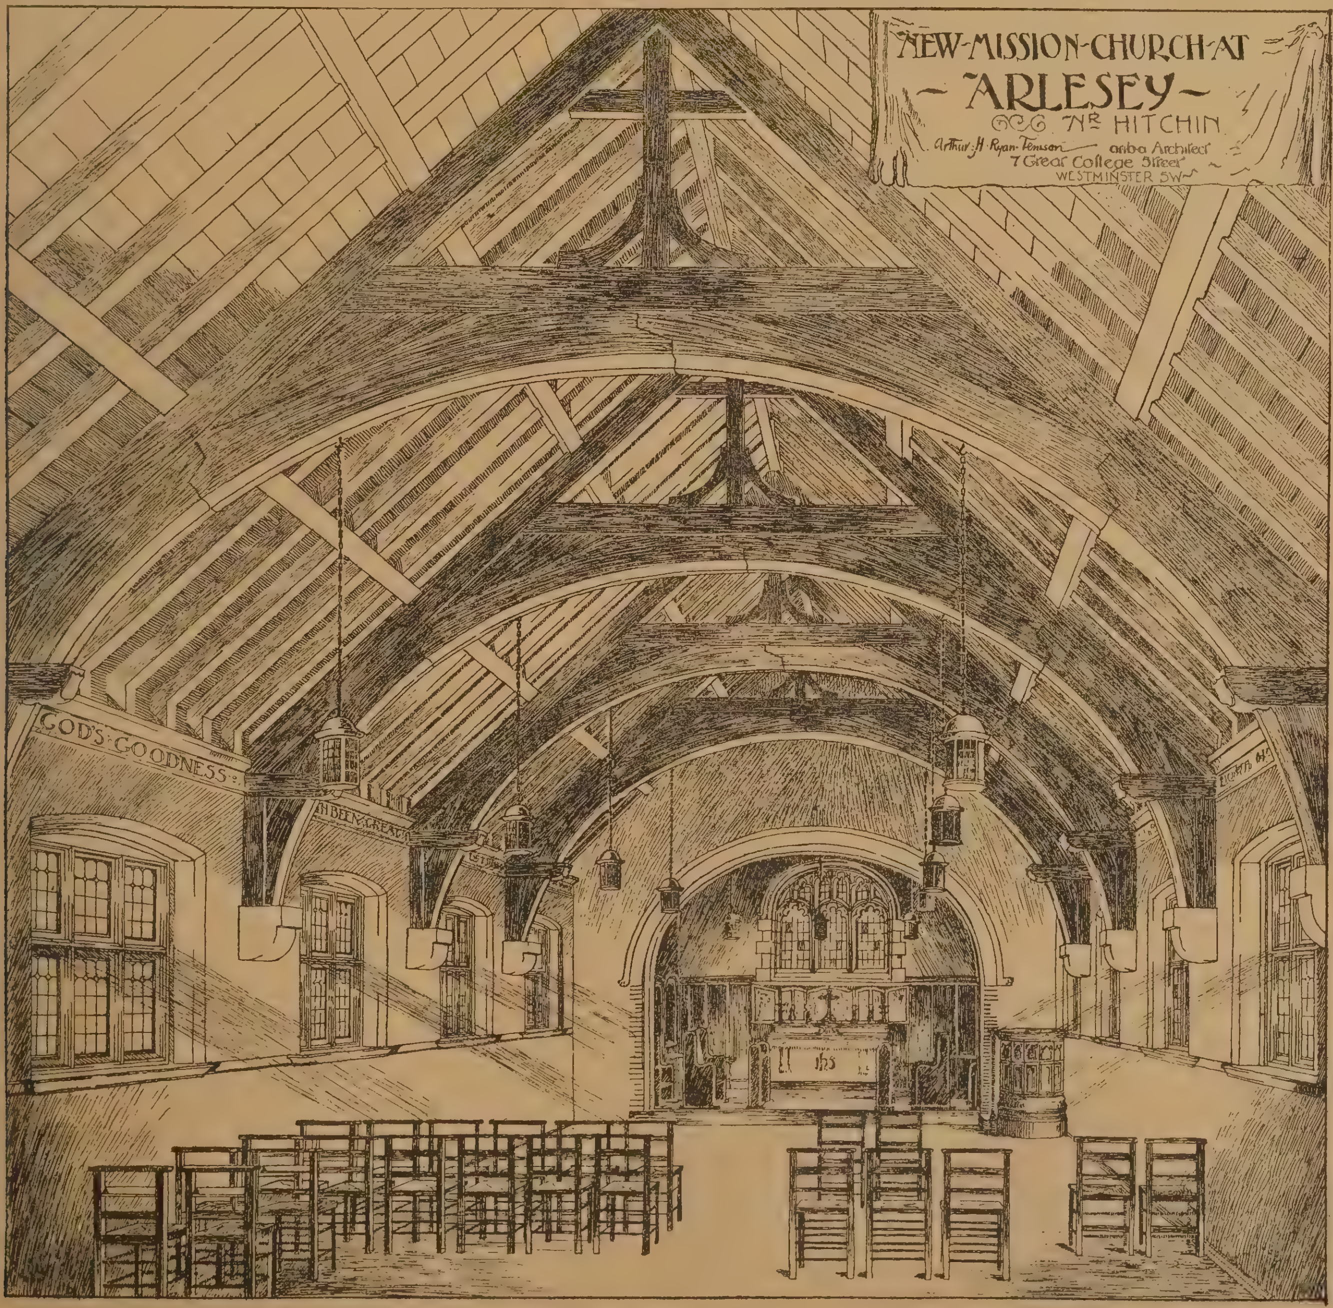
Derwentwater. CANON H. D. RAWNSLEY, writing to the "Times," says: "Subscriptions keep coming in, and we have reason to believe that by the middle of October we shall be able to feel that the nation has a mile of the western shore of Derwentwater, in unspoiled loveliness, for its permanent possession—its rest and enjoyment. The encouraging feature in the work of collecting the necessary funds has been the evident enthusiasm for the English Lake District scenery which has inspired the gifts and the deep satisfaction that an attempt has been made before it is too late to ensure that part of the surroundings of one of our most beautiful lakes shall never be jeopardised by woodcutter or builder. Mr. G. F. Watts, R.A., writes me: 'Of course I am in most entire agreement with your serious endeavour to preserve the locality; the movement has my deepest sympathy—I would say, if I could, how important I consider it in these days of change to preserve every object of beauty and worth.' By the same post that I received this letter came one from a Lancashire mill-girl, who, having asked her mother and sister to join her, sent 3s. to the fund. A common feeling makes us wondrous kind, and thanks to Wordsworth and to Ruskin and the increasing care for natural beauty that Gray ministered to we find amongst our list of subscribers side by side with the mill-hand the master-manufacturer, and side by side with the poet and authoress the humble working man. What but this common love for British scenery 'secure from rash assault' has brought such different minds together to this effort as Rudyard Kipling, the Master of Trinity, Lord Milner, the Provost of Eton, Mr. A. Waterhouse, Edna Lyall, Sir John Brunner, Mrs. Rylands, Mr. Marshall, Lord Portman, Lord Ashton, Miss Octavia Hill, the Mayor of Birmingham, the Mayor of Liverpool, Mr. H. Philips, Mr. Rathbone and the Bishop of Carlisle! It is because 'from Nature and her overflowing soul we have received so much' that it is permissible to believe that Great Britain will not let the National Trust fail of its intent for lack of the last few hundred pounds."

Stained-Glass Windows at Staines. A LARGE seven-light stained-glass east window and a small three-light side window have recently been placed in St. Peter's Church, Staines. They have been faithfully carried out by Mr. J. Jennings from the designs and cartoons of Mr. Edward Fellowes Prynne, R.B.A., brother of the architect of the church Mr. George Fellowes Prynne, F.R.I.B.A. The subject of the large window is the "Church Triumphant," and of the small one "The Nativity and Adoration of the Magi and Shepherds." The east window, which is rich in colour and full in composition, and has no conventional canopy work, represents Christ in Glory surrounded by typical saints of the old and new dispensations and hosts of angels, which crowd the top of each light as well as the tracery above. Much of the symbolism is taken from the Book of Revelation. The window, besides the figure of Christ, contains 112 figures, including saints, angels, cherubs and children, and four symbolic animals. The whole is intended to convey the sense of multitude, triumph, glory and praise, with the utmost splendour of colour. Christ is seated on a rainbow throne, and the Holy Spirit in the form of a dove hovers above. Beneath the feet of Christ is the sea of glass and the symbols of the Lamb and the open book of the Seven Seals and the Alpha and Omega. The Holy Innocents hold palms over the Lamb. The Virgin Mary crowned and Joseph holding a lily are on one side, and St. John the Baptist on the other side, and next to him kneels St. Mary Magdalene. In the lower half of the centre three-lights of the window the three great archangels stand on clouds. In the centre St. Michael stands in golden armour, with one foot on the great red dragon, whose barbed tail is coiled round the world below. St. Gabriel and St. Raphael stand on either side, looking down at the world, waiting, with trumpets of judgment. The four remaining lights—two on either side of the central three—are each divided into three parts. In the top divisions are the Apostles and the Evangelists seated on clouds, with St. Peter and St. Paul at the extreme left and right. St. Stephen is also seated with these. Each light contains one of the Evangelists. In the next compartment below are seated four fathers of the Church—St. Augustine and St. Gregory on the left and St. Ambrose and St. Jerome on the right—and the four major prophets, Isaiah and Daniel on the left and Jeremiah and Ezekiel on the right. In the third and lowest compartment are Adam and Eve on the extreme right and left. Next to Adam is Noah holding the Ark; near him stands Abraham. Next to Eve, on the other side, are Sarah and Ruth. Adam is surrounded by sheaves of corn and fruits of the earth, and a sickle, and Eve by lilies and other flowers; and behind them both are fruitful trees bearing pomegranates. Next these in the inner two lights are the four typical leaders of Israel—King David and Joshua on the left; King Solomon, holding a model of the Temple, and Moses on the right. At the tops of each light, except the centre one, are crowds of angels with harps and offering incense.

The National Bavarian Museum. THE New National Bavarian Museum is claimed to be the finest arranged in Europe. The surroundings of the new building are reposeful. The building itself is a free interpretation of the German Renaissance, with a strong dash of the Italian. The general arrangement in the series of galleries on the ground and first floors of the museum is most felicitous in its combination of the strictest chronological and historical accuracy with great æsthetic and decorative charm. The late Roman art in its provincial phases, and the Byzantine, the Romanesque, and Carlovingian one starts with. Then on through the twelfth, thirteenth, fourteenth, fifteenth and sixteenth centuries, illustrated by carvings in wood and stone, by altar-pieces rescued from oblivion in mouldering churches, by costly tapestries in wonderful preservation, by goldsmith's and silversmith's work, by ivories, glass, and objects of art of every kind—grouped, however, so that there is no confusion. The latest phases of German art, those of the seventeenth century, and of the outside Germany much despised Teutonic *rococo*, may be studied here and in Munich generally as they can hardly be studied in any other German city. The vagaries of the *rococo* are, it is true, distasteful enough to the student of the *Régence* and the Louis-Quinze styles. They are especially repellent when applied to the main architectural features of a building—as in France they seldom or never were. But often the schemes of wall and ceiling decoration have sometimes a fantastic attraction in their exuberance. A suite of apartments in the royal palace at Munich gives some of the most brilliant examples of this peculiar phase of German eighteenth-century art.

ST. ANDREW'S MISSION CHURCH, ARLESEY.

THIS little church has been erected to supply a growing and working population centred around Three Counties Station, G.N.R., and situate about two miles from the parish church. The committee's original instruction was to design a building to be used for the twofold purpose of religious services and parish entertainments, but as the work neared completion it was decided to use it for religious services only. The plan consists of a hall or nave with a spacious western half-timber porch, a shallow sanctuary (to be lengthened, so soon as funds permit, in accordance with the architect's design), an organ chamber and vestry, with a bell côte containing two bells. The stalls and furniture are from the architect's special designs, who has also suggested and had carried to completion a special scheme of colour. The heating and ventilating of the building has been carefully attended to. The materials are Arlesey brick-facings with special red dressings and stone eastern window, with green slating. The cost of the structure, exclusive of furniture, is £830, or about £3 17s. 6d. per head. The building was consecrated in June last by the Lord Bishop of Ely. The contractors are Messrs. Kelsey & Sons, of Chessington, Surrey, and the architect Mr. A. H. Ryan-Tenison, A.R.I.B.A., of 7, Great College Street, Westminster, S.W.



Keystones.

St. Mary's Church, Oatlands Park, near Weybridge, is to be completed by the addition of a tower at a cost of £2,500.

The French Sculptor Mérel has been commissioned by the municipal authorities of Neuilly to execute a bust of General Henrion-Bertier, who was for a long time mayor of the town.

A New Public Hall for Hatfield, to be known as the Victoria Hall, is being erected, the contract price for the building being £470 12s. The architect is Mr. T. Monte, of Hatfield.

Mr. J. W. Start, F.S.I., architect and surveyor, of High Street, Colchester, and of 54, New Broad Street, London, E.C., has taken Mr. Reginald Rowell, A.R.I.B.A., into partnership. The firm in future will be known as Start & Rowell.

A St. Albans' Competition.—The local competition at St. Albans for the new infants' school at Garden Fields has resulted in the work being given to Messrs. Smee & Mence, the design by Mr. S. Doddimeade Edmunds, architect, of St. Albans and London, receiving the only premium awarded.

St. Andrew's Church, Swanwick.—Messrs. Naylor & Sale, architects and surveyors, of Irongate, Derby, have prepared plans for important alterations and improvements of St. Andrew's Church, Swanwick. A tower is to be erected on the north side of the church, and in it there is to be placed a peal of bells. There is also to be a clock in the tower and a chamber for the bell-ringers. It is stated that the peal is to consist of five bells.

The Parish Church of Llandenny, near Usk, has recently undergone extensive restoration. During the work the removal of a mediæval buttress disclosed a window which is believed to be one of the very few fragments of pre-Norman church architecture remaining in the Principality. The opening is only 3in. wide, the inner splay broadening considerably. A new pulpit has been erected by the parishioners in memory of Queen Victoria, and the lych-gate, which is one of four early examples existing in the diocese, has been restored.

Vandalism at Holcombe.—At the beginning of the present month there stood on the moor above Holcombe and Ramsbottom the base of an ancient cross. For centuries it had been known as the Pilgrim's Cross, and by that name it is mentioned in numerous documents. Early in the thirteenth century it is named in a grant of land by Roger de Montbegon, and it is named again and again through the succeeding centuries in similar grants. When the cross disappeared is not known. The massive base remained until the other day, a little weathered, and with a clumsily-carved inscription referring to the labour troubles early in the last century, but otherwise Time had dealt gently with it. The Rector of Holcombe recently discovered that it had been removed, and further investigation showed that it had been broken into small fragments and buried in a wet "bog hole" not far away.

The Work of Placing the Gigantic Statue of King Alfred on its pedestal came to an abrupt conclusion at Winchester on Tuesday of last week owing to an accident which caused considerable excitement. The work had been going on during the whole day, and a large number of townspeople had gathered to witness the raising of the figure, which was being done by means of a rope connected with a stationary engine and running over a pulley hung between two shear-legs. The figure weighs nearly 6 tons and measures about 17ft. About half-past four the upper portion had been raised a few feet, when one of the guy ropes snapped, and a second afterwards one of the shear-legs broke under the extra strain thrown upon them, and the whole structure came down with a crash. Fortunately, between the breaking of the guy rope and the snapping of the shear-leg there had been time to place a prop under the statue, and though one of the shear-legs fell across it it is not thought to be injured. The contractors for the work are Messrs. Driscoll Brothers, of Maidstone, one of whom was struck by a falling pole as he was giving orders to the engine-driver. He was badly bruised, but not dangerously injured.

As a Memorial to Cardinal Manning at Nazareth House, Hammersmith, a "Manning" ward has been inaugurated; and the night refuge in Providence Row, E.C., will be extended at a cost of over £7,000.

Mr. H. R. Lloyd, a well-known Redditch architect and surveyor, died last Thursday from accidental poisoning. He was confined to his bed with a cold, and it is stated that Mrs. Lloyd mistook a bottle of carbolic acid for his medicine and administered a dose from it. She at once gave the patient an antidote, but he died in great agony a few minutes later.

A Royal Artist.—The Isle of Wight Fine Art Society opened its annual exhibition at Ryde last week. The place of honour was given to a painting in oils of some Egyptian ruins by Princess Henry of Battenberg (the president of the society). Her Royal Highness has for some years been represented by paintings at this exhibition.

The New Park of Potter Newton, recently acquired by the Leeds Corporation for £35,000, was formerly opened last week. The estate includes a mansion-house, which, it has been suggested, should be used as the lodgings of the assize judges. The park is an undulating and picturesque piece of ground, and is one of several parks which the Corporation have provided for the people.

At St. Paul's.—One of the original old lead pipes on the north side of the interior of St. Paul's Cathedral, of enormous weight and length, has been removed, renovated and refitted. These large pipes were for carrying off the rainwater from the roof. The installation of electric light in the building is progressing favourably. A Bond Street firm of electricians are carrying out the order, and it is expected by the beginning of next year the work will be finished. The decorations are by no means finished, and the scaffolding for the completion of the roof of the chancel is still up. Mr. Harding, who for twenty-five years has held the office of clerk of the works, has not had a single mishap during his whole period of office; and in recognition of this fact and his services to the cathedral the dean and chapter and the workmen presented him with several handsome pieces of furniture on his twenty-fifth anniversary.

The New Technical College at Scarborough, which has been erected by the Corporation on a commanding position on The Green, is almost complete. The building is of red bricks, with buff-coloured terra-cotta, a square tower capped by a dome being a feature at the south-west corner. The building is in the English Renaissance style. In the basement the physical laboratory, the heating apparatus, working machinery, testing machines and workshops are situated; on the ground floor is the examination and lecture hall 70ft. by 30ft. In the first floor are the chemical laboratory 70ft. by 30ft. and 28ft. high, and the chemistry lecture theatre, with accommodation for eighty-four and sixty students respectively. Rooms for astronomical study are on the second floor and in the tower. Projecting from the latter is a handsome clock after the pattern of that in the old Tolbooth, Edinburgh. The cost of the site, building and furnishing will be about £21,000 or £22,000.

The Report of the Director of the National Gallery, Ireland, for the year 1900, which has just been issued as a Parliamentary paper, gives details of the pictures, drawings and engravings which have been purchased and added to the collection during the period under review. Among these are the "Virgin and Child," ascribed to Jan Mostaert, and "The Dilettante," by Cornelis Troost. The donations include "The Flagellation," by Luea Signorelli, and "Naworth Castle." The late Mr. Henry Vaughan (London) bequeathed a series of thirty-one drawings by J. M. W. Turner, R.A., on the condition that they should be publicly exhibited only during the month of January in each year. The gallery has also received valuable additions to the general collection by the bequests of the late Miss Margaret M. Stokes and Sir Henry Barron. For the portrait gallery Miss Stokes also left a sketch portrait of Lord Edward Fitzgerald, by James Petrie, and a sketch for portrait of John Clarence Mangan. During December last there was an exhibition of works by the late Sir Frederic W. Burton.

The Queen Victoria National Memorial Fund now amounts to £150,000.

The New Anatomical Department of Glasgow University, comprising an extensive laboratory, museum, &c., was opened last week. The architect was Mr. Frank Burnet.

Mr. George Lambert, F.S.A., died last week in his seventy-eighth year. He was well known as a gold and silversmith in London, and held the office of prime warden of the Goldsmiths' Company.

The Buxton Thermal Water Pump Competition has been won by Mr. Gustave Agate, of Pendleton, Manchester. The second premium has been awarded to Mr. C. Swain, of Buxton, and the third to Messrs. Warren & Cargill, of Matlock Bridge.

Mr. John R. Thomas, the architect of the new Hall of Records in New York, died recently. After his death the papers said that his successors would doubtless be Messrs. Horgan & Slattery, the Tammany architects. The public hardly believed that the Administration would have the impertinence to take this step, and so spoil one of the most beautiful buildings in the city. The Board of Estimate and Apportionment have, however, given the work to Messrs. Horgan & Slattery.

Competition for Llanrwst Market Hall.—Twenty competitors submitted designs for the proposed new market hall, &c. at Llanrwst in North Wales. The site is an important one in the centre of a large square. The only premium of £20 has been awarded to Mr. E. Grubb, of 13, Rawcliffe Street, Blackpool, for a design intended to be carried out in Penmaenmawr granite, freely relieved with Yorkshire stone dressings.

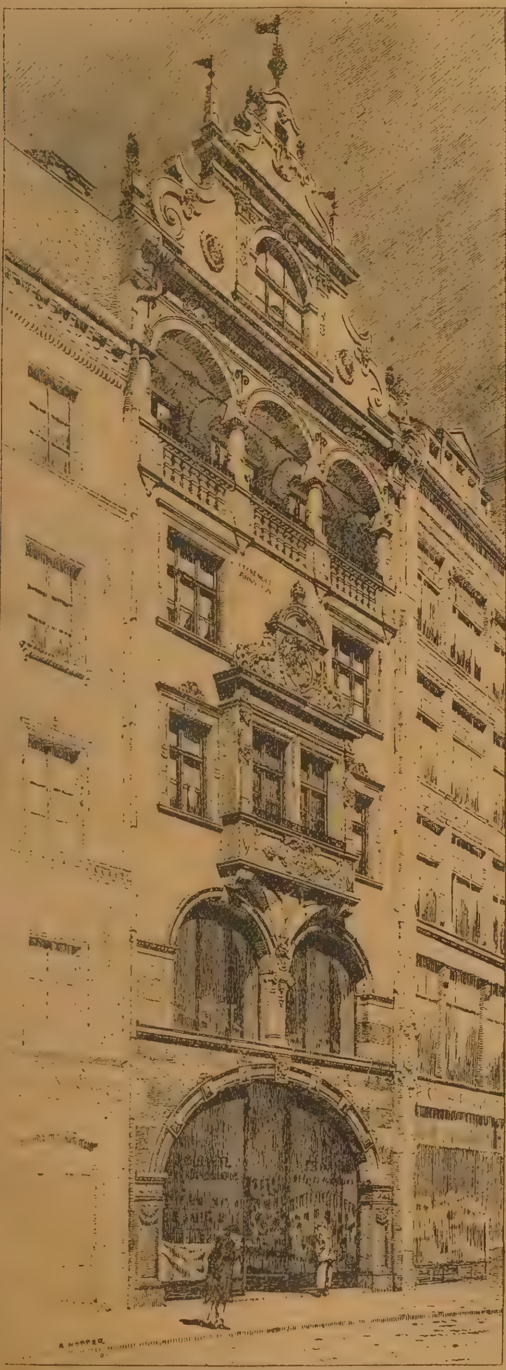
At the Battersea Polytechnic, Battersea Park Road, S.W., classes have been arranged for in mechanical engineering and building construction. The class in masons' work is a new departure, and the instructor is Mr. John Wornell. The class is intended for apprentices and artisans engaged in masons' work. The instruction will be thoroughly practical, and will include the application of descriptive geometry to masons' work, the making of working drawings, setting out and executing the work in stone. Further particulars can be obtained from the secretary, Mr. Joseph Harwood.

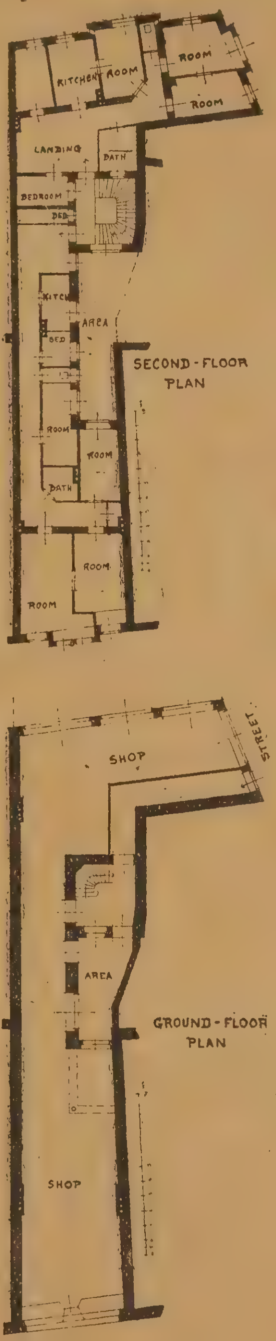
The Hogarth House Preservation Committee has just issued a circular reporting progress. To realise the end in view—viz., to preserve the house and grounds as a museum and memorial of the great satirist—a sum of £1,500 at least will be required for the purchase of and repairs to the property. Of this amount about £300 has been received or promised, and the committee appeals earnestly for further assistance, which must be prompt to be of any use, since the building is threatened with destruction or the worse fate of being let in tenements. Contingent on the fulfilment of the scheme the committee has already received promises of original paintings, prints and Hogarth relics from Lord Ronald Gower, Mr. Austin Dobson, and others, for the museum. Donations may be sent to the hon. secretary, Mr. W. H. Whitear, 4, Ravenscroft Road, Chiswick.

The Hampstead Synagogue has been enlarged from designs by Mr. Delissa Joseph, F.R.I.B.A. The enlargement has been effected by removing the east wall and setting out the building eastwards to the limit of the site, and making both nave and aisles longer. The choir, which was originally at the rear of the Ark, is now in a gallery above the Ark. The enlargement has provided for a large number of additional seats in the Synagogue. Originally there were 366 sittings on the ground floor of the building, and 299 in the gallery. The additional seats provided by the enlargement are eighty-four on the ground floor and sixty-two in the gallery, giving a total seating capacity for 811 people. A further improvement has been effected by the making of two supplementary staircases at the east end, one of which leads directly into West End Lane. The Romanesque design of the original structure has been carefully maintained, and the whole building has been decorated in pure white.

NEW CHURCH AT EAST KIRKBY.

A NEW church for the parish of East Kirkby, in the county of Notts, is being erected at a cost not to exceed £5,000, and the architect has so arranged his plans that, while building a complete church, no difficulty will be found in adding to the accommodation should future developments necessitate an enlargement. The building will consist of a nave 78ft. long and 27ft. wide internally, with aisles (merely passages 4ft. wide), a chancel 30ft. long and 21ft. wide, vestries for clergy and choir with heating chamber under, and bell turrets at the west end. The principal entrance will be at the west end facing Lowmoor Road, the highway between Nottingham and Mansfield, and an internal porch will be formed by a screen and swing doors. The style of architecture is English Gothic of the early fifteenth century, and the church is planned to accommodate about 360 adults and to admit of lateral extension by increasing the width of one or both the aisles according to future requirements. The nave and aisles are divided into five bays, with octagonal stone columns and moulded arches springing from the piers without capitals. The chancel arch will be enriched with carving. The roofs will be of open-timber construction, with hammerbeam trusses, the wood being stained dark walnut colour. The floor under the seats will be of wood blocks, and in the passages, &c., of terrazzo and marble mosaic. The walls will be of brick, with red facings and stone dressings externally, and plastered and distempered internally, except where stonework is used. The windows will be of stone, the arched heads being filled with tracery, that of the large west window being of a rich character. The glazing will be of leaded cathedral glass, in small quarries. The roofs will be covered with red tiles and the turret roofs with lead. The heating will be by means of hot water on the low-pressure system, with pipes chiefly above the floor level, and occasional radiators. The ventilation will be by means of hopper casements to some of the windows, and ventilating tiles in the ridge of the roof. It is intended to have the choir seats and clergy stalls of oak, and the general seating of pitch-pine stained brown. Space for an organ is provided between the chancel and vestry. The architect is Mr. Louis Ambler, F.R.I.B.A.





DWELLING-HOUSE AND SHOP IN MUNICH. M. OSTENRIEDER, ARCHITECT.

LIVERPOOL ARCHITECTS AND WORKMEN'S DWELLINGS.

"IT will be remembered," says a correspondent to the "Liverpool Post," "that after the very expensive experiment made by the committee in the Victoria Square blocks, local architects were invited to compete for others on the sites adjoining, the selection to be left to the late Mr. Waterhouse, R.A. This was done, the work carried out, and, I see from the Corporation accounts, with a very largely increased return on the amount expended. Notwithstanding this experience the committee renewed their building by their own staff, and their latest effort was announced at the last council meeting, to the tune of 8d. or 9d. per cube ft., or nearly double the rate proved necessary by the competition, at which the members naturally took fright, and a return to competition was suggested. If rumour is to be believed, it is now proposed that the plans be thrown open to general competition, and a premium of £250 offered, which I venture to say would be a ridiculous waste of public money for such simple plans as are required; whilst to go out of our city for competitors for it would be leaving those whose local knowledge and experience we require in an especial manner, on the off-chance of getting we know not what from outsiders, who have neither one nor the other, and no practical acquaintance with the local prices upon which everything depends."

THE NEW PUBLIC OFFICES,

Professor Aitchison and the Official "Defence."

IN a letter to the "Times" Professor Aitchison says: I do not think the public who understand the matter will join in your correspondent's pæan at Brydon's offices being handed over to the Office of Works (see our issue for last week), nor think that the character of our public architecture will be improved by it.

Can anyone be surprised that no architect of eminence would undertake to carry out the work on the undertaking of keeping exactly to Brydon's sketch? Brydon would certainly not have done so, but would have carefully studied each portion again, so as to bring them and the whole to perfection, while every moulding and detail would have been drawn by his own hand. I do not believe that the architects of England are less patriotic than the Italians of the sixteenth century, for though the design for St. Peter's was Bramante's it had to be carried out by others after his death—by B. Peruzzi, by Raffael, Giuliano da San Gallo, Fra Giacondo, Antonio da San Gallo the younger, Michelangelo, Giacomo della Porta, and Vignola—before its final alteration by Carlo Maderno, and Michelangelo made a great point of carrying out Bramante's work in its original spirit.

The letter of your correspondent is admirably written to throw dust into the eyes of the public; all sorts of incongruous subjects are introduced, including the widening of Piccadilly.

The bad arrangement of the Treasury, which was built or altered by Soane and refronted by Barry, when lighting and ventilation were in their infancy, is pointed to, and it is insinuated by this that independent architects are incompetent to deal with planning, lighting and ventilation; and though every architect would necessarily consult the heads of each department as to the arrangements they require, it is suggested that the Office of Works understand their wants better than they do themselves.

It is doubtless convenient to be able to hand over our public buildings to a department and to have no further trouble till the final fiasco. What the public should consider is whether the finest possible building will result from it. The officers and clerks of the Public Works Department are already overworked, and beyond their ordinary work they have an elaborate building to look after, the War Office, and they are now again asked to give a part of their spare time, which is all they have to give, to the perfecting of another large building, and one of the most important of our time; and the verdict upon this will not only be given by English, but by French, Italian, German, Austrian and American architects.

It is too late, I fear, to rescue the War Office, but there is time to rescue Brydon's offices from the clutches of the Office of Works.

The residue of the architect's fees will necessarily go to repay the officers and clerks of the Office of Work for their extra work; and who could object, if they were the proper persons to do it? But I think I have shown that they are not, nor is it to be expected from overworked men, who have only a small portion of their spare time to devote to it.

Views & Reviews.

Two Cathedrals.

These are the latest additions to Bell's "Cathedral Series." It is a deplorable fatality that the history of our great cathedrals should include such a disastrous record of restoration, though there is some relief in the fact that the days of those ardent enthusiasts at reconstruction are past and for the present the matter is more reverentially handled. Bristol Cathedral, though one of the least important, possesses many features of interest. The Elder Lady Chapel on the north side of the north aisle is the chief specimen remaining of the Early English work. It was altered by the insertion of a larger east window towards the end of the twelfth century by Edmund de Knowle, who, when he became abbot, made great additions to the building; in fact, it is to him we owe the eastern half of the fabric, which was so well carried out that it has needed no restoring internally, and seems as structurally sound now as it was when completed. Abbot Snow, who succeeded Knowle, has been credited with extensive building operations, but it is difficult to see what he did. Work in earnest began with Abbot Newbury, being continued by the succeeding abbotts Hunt and Newland. From these early days there is little to chronicle till we reach the "restoration" period; then too many facts confront us. Dean Elliott planned a reseating of the cathedral, and with the aid of Sir Gilbert Scott and Messrs. Pope & Bindon alterations were effected which resulted in the total destruction of the organ screen of 1540, partial destruction of the stalls, and the insertion of an entirely new screen, "insipid in character," across the eastern arch of the tower. In 1888 the Abbey Gateway was restored by Mr. Pearson, who succeeded Mr. Street as architect to the chapter; the north transept was "thoroughly restored" two years later; and shortly afterwards the Early English Lady Chapel and the tower were restored. Practically half of the length of the exterior is new, and the other half has already been or is about to go through a severe course of restoration. One more note and we may conclude these remarks on Bristol Cathedral. There used to be an eagle lectern of good honest work which was given to the cathedral in 1683. In 1800 this was sold for £27 (a sum less than its present price as mere metal), and a modern "art" one of the highest possible finish and enhanced by pieces of coloured glass was introduced. It is said to have cost £150. The old one was given to the church of St. Mary le Port *for ever!*

The second book deals with Ely Cathedral, which, for external grandeur of effect, few would dispute to be surpassed in England only by Durham and Lincoln. Ely stands on an eminence, and can be seen well from the town of Peterborough, about thirty-five miles away as the crow flies. In Professor Freeman's words, "The first glimpse of Ely overwhelms us, not only by its stateliness and variety of its outline, but by its utter strangeness, its unlikeness to anything else. Ely . . . with its vast single western tower, with its central octagon, unlike anything else in the whole world, has an outline altogether peculiar to itself." The history of the building has already been the subject of numerous writings, and we do not intend to enlarge on the matter now. Needless to say, it has a record of restoration like the rest.

Both works are excellently produced, the illustrations, though small, being clearly printed. Mr. Massé's is, however, the more carefully written of the two.

"The Cathedral Church of Bristol," by H. J. L. J. Massé, M.A.; "The Cathedral Church of Ely," by the Rev. W. D. Sweeting, M.A. London: George Bell & Sons; price 1s. 6d. nett each.

COMING EVENTS.

Wednesday, September 18.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. J. Priestley, B.A., M.D., on "Duties of a Sanitary Inspector—Outdoor," 7 p.m.

Friday, September 20.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. J. Priestley, B.A., M.D., on "Duties of a Sanitary Inspector—In door," 7 p.m.

INSTITUTE OF SANITARY ENGINEERS.—Examination qualifying for admission to Institute (First day).

Saturday, September 21.

INSTITUTE OF SANITARY ENGINEERS.—Examination qualifying for admission to Institute (Second day).

NORTHERN ARCHITECTURAL ASSOCIATION.—Visit to Sunderland: The Pier Works, Messrs. Botterell & Roche's New Offices (Messrs. Henderson & Hall, architects), and New Board Schools (Messrs. Barnes & Coates, architects).

Tuesday, September 24.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.)—Mr. J. Priestley, B.A., M.D., on "Duties of a Sanitary Inspector: Offensive Trades and Trade Nuisances," 7 p.m.

Thursday, September 26.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. Henry R. Kenwood, M.B., D.P.H., on "Infectious Diseases," 7 p.m.

Friday, September 27.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. Henry R. Kenwood, M.B., D.P.H., on "Methods of Disinfection," 7 p.m.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
		BUILDING:		
Sept.	20	Letterkenny—Diocesan Schools	Most Rev. Dr. O'Donnell	M. O'Callaghan, Main Street, Letterkenny.
„	21	Ince, near Wigan, Lancs—Public Offices	Urban District Council	Heaton, Ralph & Heaton, Architects, Wigan.
„	21	Dorchester—Works	Trustees of Municipal Charities	A. L. T. Tilley, Architect, Dorchester.
„	21	Mynachlogddu, Pembrokeshire—Schoolroom and House	School Board	W. J. Williams, 1 High Street, Cardigan.
„	21	Ashford, Kent—Additions, &c., to Schools	School Board	Jeffrey & Lacey, Architects, Ashford, Kent.
„	21	Banff, Scotland—Boiler House	District Lunacy Board	J. Morrison, Solicitor, Banff.
„	22	Whaley Thorns, near Langwith—Schools	Bolsover School Board	Vallance & Westwick, Architects, Mansfield.
„	23	Newcastle-under-Lyme, Staffs—Alterations at Workhouse.	Union Guardians	Chapman & Snape, Architects, Newcastle-under-Lyme.
„	23	Leeds—Coal Stores	City Council	R. H. Townsley, Gas Offices, Dewsbury Road, Leeds.
„	23	Barnstaple—Extension of Imperial Hotel	———	W. C. Oliver, Architect, Bridge End, Barnstaple.
„	23	London, S.E.—Pulling Down, &c.	Bermondsey Borough Council	Borough Surveyor, Town Hall, Spa Road, Bermondsey.
„	23	Tyldesley, Lancs—Shed	Urban District Council	Engineer, Gasworks, Tyldesley.
„	23	Great Harwood—Slaughter-houses	Industrial Co.-op. Provision Soc., Ltd.	J. B. Thornley, Architect, Market Street, Darwen.
„	24	Bromley, Middlesex—Alterations, &c., to Asylum Mortuary.	Poplar and Stepney Asylums Managers	J. & S. F. Clarkson, 136 High Street, Poplar, E.
„	24	Trealaw, Wales—Twenty to Thirty Cottages	New Century Building Club	A. O. Evans, Architect, Pontypridd.
„	24	Field Broughton—Vicarage	———	Wright & Son, Surveyors, Lancaster.
„	24	London, N.W.—Generating Station, &c.	Willesden District Council	O. C. Robson, Engineer, Public Offices, Dyne Road, Kilburn, N.W.
„	24	Norham, near Berwick-on-Tweed—Villa	———	J. L. M. Sherriff, East House, Norham.
„	24	Walthamstow—Cookery-room, Cloakroom, &c., at Schools.	School Board	H. Prosser, Architect, Board's Offices, High Street, Walthamstow.
„	24	West Ham—Underground Sanitary Convenience	Corporation	Borough Engineer, Town Hall, West Ham, E.
„	24	Nottingham—Rebuilding Inn	Joint Station Committee	O. S. Holt, Secretary, London Road Station, Manchester.
„	24	Middlesbrough—Gasholder Tank, Foundations, &c.	Gas Committee	D. Terrace, Manager, Gasworks, Middlesbrough.
„	24	Belfast—Additions to Workhouse	Union Guardians	J. C. Neeson, Clerk, Union Workhouse, Belfast.
„	25	Werneth, Oldham—Cotton Shed	Lancashire & Yorkshire Railway Co.	Engineer, Hunt's Bank, Manchester.
„	25	Grassenhall, Norfolk—Alterations, &c.	Union Guardians	J. B. Pearce, Architect, Upper King Street, Norwich.
„	26	Burry Port, Wales—Schools, &c.	Pembrey School Board	R. Williams, Architect, Burry Port.
„	26	London, S.E.—Wall	Lewisham Borough Council	Surveyor, Town Hall, Catford.
„	26	Rainhill, Lancs—Additions, &c., to Asylum	Lancashire Asylums Board	J. Gornall, Clerk, County Asylum, Rainhill.
„	26	Ballymoney—Additions to Workhouse	Union Guardians	T. B. Hamilton, Clerk, Boardroom, Ballymoney.
„	27	Kildwick—Restoration of Church	———	Wright & Son, Surveyors, Lancaster.
„	27	Pellon, Halifax—Fourteen Houses, &c.	———	M. Hall, 29 Northgate, Halifax.
„	27	Whitstable, Kent—Coastguard Buildings	Admiralty	Director of Works Department, Admiralty, 21 Northumberland Avenue, W.C.

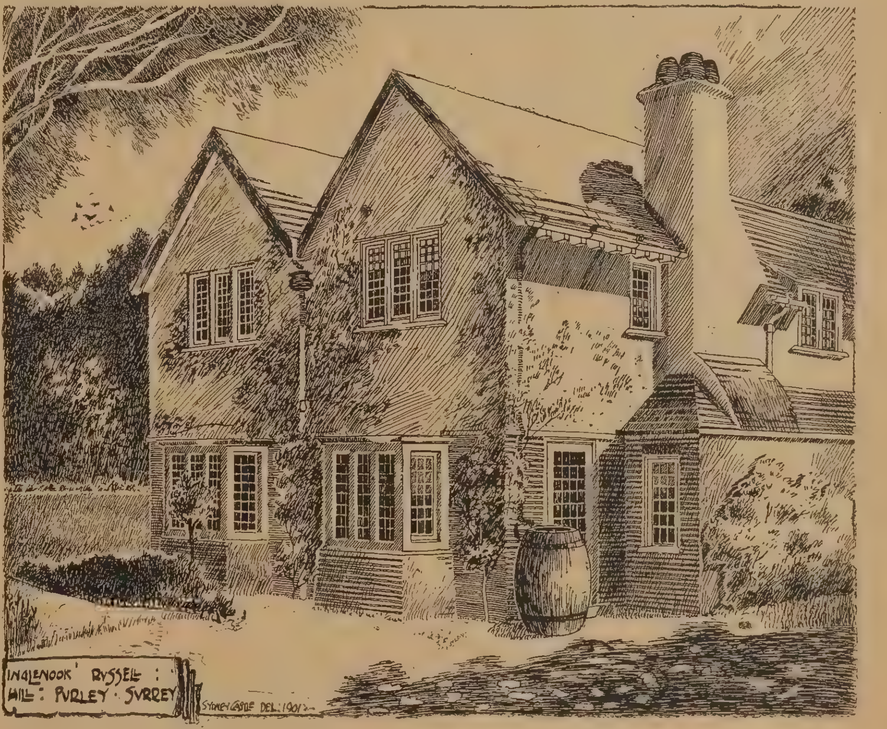
The Garden City. ON another page we publish a brief report of the important conference of the Garden City Association which was held at Birmingham last week; but it is not that we think so little of the project that the particulars given are so limited, but because we were among the first to draw public attention to the matter, and have published in numerous back numbers a plan of the proposed city and full details about its inception and development; there is, therefore, no need to repeat what has already been said. In every community there will always be found a certain number of persons who are so thoroughly satisfied with (or indifferent to) existing conditions that no doctrine appeals to them so strongly as the *laissez faire* doctrine; yet we do not think that even these would deny the urgency of finding some satisfactory solution of the housing problem. As Mr. Ralph Neville pointed out most precisely at the Garden City Conference, with physical degeneration proceeding (in some places at a most rapid rate), nothing can prevent the ultimate decadence of the race if we do not see that the mass of the people live lives which are consistent with physical development. Of course the awful truth of this has been apparent for years and years past, and most zealous efforts have been made by corporations in almost all the large towns throughout the country to arrest the evil by clearing insanitary areas and erecting huge tenements upon them; yet, however difficult any other method may be, we cannot think that this is the correct one; for it is like attempting to relieve the pressure in a dense crowd by a fierce struggling in the centre. On the other hand, the building of houses on the outskirts of cities immediately creates a fresh problem, that of transit, and with the present facilities of communication this engenders failure. In such a dilemma it seems to us that the Garden City scheme affords, at least, a measurable solution. Briefly, it is proposed that a piece of ground in the vicinity of an existing city shall be acquired and laid out so as to secure the advantages of town and country; and on the fringe of this area it is proposed that the several factories and works shall be erected, the whole being enclosed by a belt of trees. There are many difficulties to carrying out such a scheme, but they are not insuperable, and we trust that, with such stimulating experiments as those of Messrs. Lever Brothers and Messrs. Cadbury, the Garden City Association will secure their land and those manufacturers who are essential to its development. For good or ill there has been an economic change in this country from agricultural production to commercial production; we have gone from the plough to the factory. That change has taken place and is still taking place, and it is useless to attempt any solution which ignores such a change. It is futile to say to the factory hand, "You should return to the land." He does not want to return to the land, however much he may enjoy a holiday in the country. But if the manufacturers can be induced (as many have already been induced) to take their works away from the town to the country, a great opportunity offers itself to house the workers in a healthy manner. So that we commend the Garden City scheme most earnestly to our readers, believing it to be—certainly not a panacea for all the troubles—but a sensible, hygenic, and practical solution of this problem which so undermines the foundations of our national existence.

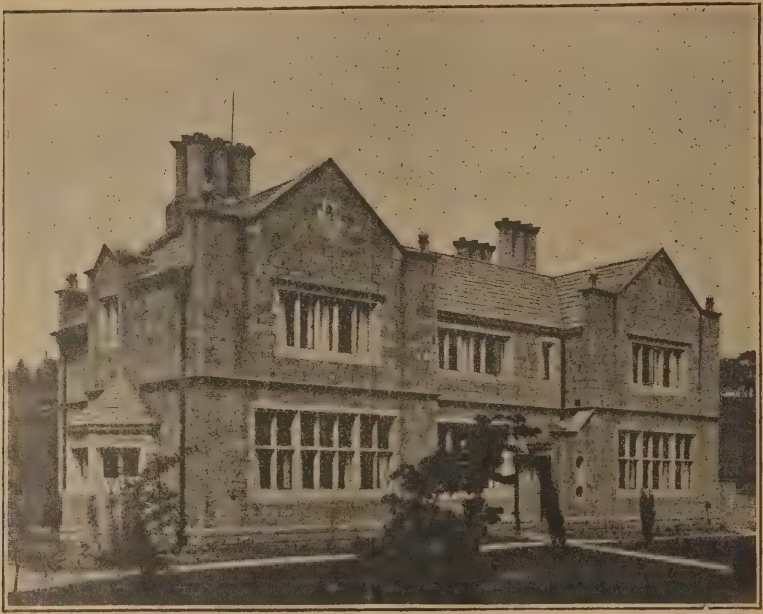
London Streets. THE County Council have just issued, through Messrs. P. S. King & Son, a list of the streets and places within the Administrative County of London. It has been compiled by the Superintending Architect of the Council, who is the authority for the naming of the thoroughfares. The volume, which is arranged alphabetically, gives the names of each street and various other particulars, together with names now abolished. Mr. G. L. Gomme, the Clerk to the Council, writes an interesting introduction on the historical significance of street names. "Probably," he says, "the oldest names are Billingsgate (corrupted from Belunsgate) and Ludgate, both, according Dr. Rhys, derived from the days of the Celtic settlement at London. Of Roman London there are apparently no relics in street names, for Watling Street is the Saxon name given to this Roman roadway. Of Saxon London there are innumerable examples. Perhaps the most interesting is a name which was threatened with destruction in the days of the Metropolitan Board of Works, and was saved by the pleading of Mr. W. J. Thoms the antiquary, who converted the Board to the importance of preserving this name; this was Tothill Street, Westminster. Another Tothill Street occurs at the lower end of Gray's Inn Road. These names record the Toot hills, intimately associated with Saxon civil administration. Another name which is already destroyed by the march of events is Wych Street, on the site of the new street from Holborn to the Strand. This is the second syllable of the name of the Danish community which settled just outside the walls of London—namely, Aldwych—and is the equivalent of the second syllable in Norwich and other Danish settlements."

A Surrey House. MR. SYDNEY CASTLE, of 22, Louvaine Road, New Wandsworth, S.W., whose drawing we publish on this page, informs us that he has been unable to ascertain the name of the architect of this house, which is situated at the top of the Russell Hills near Purley. It is treated with Broseley tiles and white rough-cast, with a red-brick base. The woodwork is painted white and the ironwork black.



INGLENOOK' RUSSELL : HILL : PURLEY · SURREY
SYDNEY CASTLE DEL: 1901

Stinging, but True. OUR readers may have become tired of the discussion apropos the new Government offices; and of a truth it is vexatious. Nevertheless, the matter is of such importance that every effort needed to be made to save the buildings from the Office of Works. In the course of the discussion no more pungent criticism has appeared than that of Mr. Leonard Stokes which we publish on page 104 of this issue. Even though it be thought that the Office of Works intend, willy-nilly, to complete the buildings, this letter is worth reading for its militant humour. It is the most interesting contribution which has been made to the discussion.



HOUSE AT BAILDON, YORKS: GARDEN FRONT. ADKIN AND HILL, ARCHITECTS.

MODERN HOUSES IN YORKSHIRE.

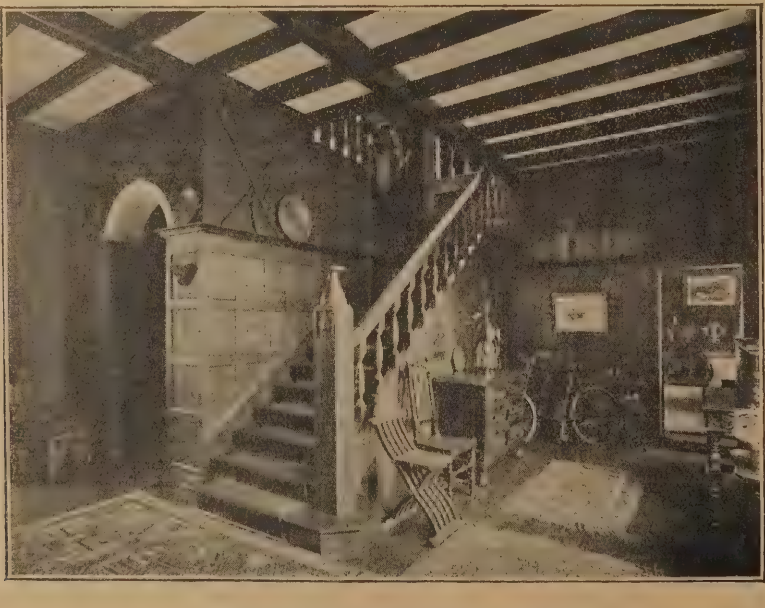
THE following particulars are given in connection with the several houses by Messrs. Adkin & Hill, architects, of Bradford, which we illustrate this week :—

House at Burley-in-Wharfedale.—This house, for Mr. J. Benn, is built of local sandstone lined with brick. The exterior above the first-floor level is of rough-cast or tile-hung. The tiles are specially selected (brindled) as to colour in order to avoid the hard boiler-plate appearance of the usual samples. The oakwork throughout is fumed dark and left with a dull surface. The house is two-storeyed with the exception of the servants' attic over the north wing. The kitchen is of one storey only. The cost works out at 6d. per foot cube, including all fittings.

House at Baildon.—This house, for Mr. J. Ambler, is built of local sandstone evenly punched. The roof is of stone slates. The oakwork throughout is fumed dark and oiled. The house has no cellars and the small attic accommodates the servants and has a box and cistern room. Attention is called to the fact that the servant can answer the front door without entering the hall. The cost works out at 7d. per foot cube, including all fittings.

Houses at Heaton, Bradford.—These houses are built of local common hammer-dressed wallstones to the height of the first floor, then tile-hung up to eaves. The dining-room is covered with a bright red wallpaper, and the chairs are in red leather of the same tone. The frieze is white and the beams vandyke brown. The sgraffito work to fireplace was designed and executed by Mr. W. P. Rowe, of Leeds. The cost is 6d. per foot cube, all fittings included.

Residence at Ilkley.—This house, for Mr. F. B. Muff, is built on a very narrow site, which considerably influenced the planning. The chief points secured in the design are : the easy access of the domestics to the front entrance without passing across the hall; the approach to the children's quarters by either entrance, without encroachment on the portion of the house given up to the use of the seniors; and the orientation of the different rooms. The basement contains the larder and laundry; the nurseries, &c., are on the second floor. Local sandstone is used for the outer walls, timber and rough-cast being introduced on the upper floors. The roof is tiled. The cost cubes out at 6½d. per foot.



THE HALL, HOUSE AT BAILDON, YORKS.

THE PRESERVATION OF STONEHENGE.

UNDERPINNING THE STONES.

SIR EDMUND ANTROBUS is now having the recommendations carried out which were made by the committee representing the Society of Antiquaries, the Wilts Archæological Society, and the Society for the Protection of Ancient Monuments, whom he invited to advise him as to the best steps to be taken for the preservation of Stonehenge and the prevention of further falls such as occurred on the last day of 1900.

The committee, among other things, recommended that measures should be taken to raise the tallest stone of all at Stonehenge—the huge monolith which overhangs the altar stone, and which, with the exception of Cleopatra's Needle, is the largest and finest monolith in England—to a perpendicular or nearly perpendicular position, and to underpin its base with concrete. This stone is leaning at a dangerous angle, its foundations having been weakened by the diggings made by the Duke of Buckingham in 1620, but it rests on a smaller stone. There are, however, two large vents or cracks in the great monolith, and it was feared that wet getting into these cracks, and the action of frost, would cause them to extend, so that if the stone were to fall it would be broken into three pieces.

The preparations for raising this stone are being carried out under the supervision of Mr. Detmar Blow, who is acting as professional adviser and architect to Sir Edmund Antrobus; and Dr. Gowland, professor of mineralogy at the Royal College of Science. The first steps taken were the cradling of the stone in a framework of timber to prevent it from cracking while being raised and the carrying of stout ropes from the stone to two winches which now support the monolith, and by means of which the raising will be effected. Before the stone is raised, however, part of the bed of concrete by which it is to be under-pinned will be placed in position, and excavations are now being made for this purpose. The excavations have been commenced on the south-east side of the stone and are being conducted in the most careful and systematic manner. A careful survey of the surface was made; and, when the concrete bed, the top of which will be about 18in. below the ground level, has been completed, the turf will be replaced in exactly the original position. The excavations will be made in sections, concrete being placed in one section before the other is commenced, so that the stone will be supported as far as possible. It is thought that the work may possibly furnish some data from which a clue might be obtained to assist in the clearing up of that prehistoric mystery—the age of the stones and how they were squared, and the mortices and tenons wrought. Dr. Gowland has found a large number of palæolithic implements and some sarsen and syenite chippings and it is thought that these discoveries clearly point to the fact that the monument dates back to the Stone Age and that the stones were partly if not wholly, dressed on the spot. The tools found consist of hammers and axes and some of them are remarkably well formed. These are the first stone implements which have been found in the immediate vicinity of Stonehenge. When research was made in the barrows in the district, sarsen stone chippings and bronze tools were found, and from these the opinion was formed by many that the stones were erected by a bronze-using people. A thorough examination of the soil is being made, every particle of earth being minutely inspected. A plan is made, divided into longitudinal and transverse sections, each of which is numbered and lettered, so that the exact locality of any find can be accurately determined. The soil as it is dug out is sifted through a series of graduated sieves, and the results of the siftings are examined by Dr. Gowland, who remains at Stonehenge all day. It was found that there were rabbit burrows close to the stone, and these would of course loosen the earth, and probably in time cause a further subsidence.

The bottom of the stone has been reached at a depth of 8ft. 6in. When the underpinning has been accomplished the safety of the stone, it is considered, will be ensured for hundreds of years to come.

After the tallest stone has been raised and supported, excavations will be made round one of the trilithons in the outer circle, on the Amsbury side of Stonehenge and near the tallest stone. This trilithon is thought to be in an unsafe condition, and will be supported by a subterranean bed of concrete in the same way as the monolith; but the position of the two uprights will not be altered in any way.

The present operations will probably occupy about two months. Sir Edmund Antrobus's object is simply the conservation of the stones; it is not intended to attempt a work of restoration based on any conception of what the original condition of Stonehenge may have been.

OXTON CHURCH.

THE ancient parish church of Oxton, after undergoing a thorough and extensive restoration, has been reopened. The quaint and interesting appearance of the edifice has been successfully preserved, and where additions have been made they have been executed in keeping with the prevalent style of architecture. The church, which has undergone a number of restorations, dates back to a remote period and boasts registers commencing in 1558. The tower has now been pointed in cement within and without as far as the projecting ridge of stone, to which the ivy then reached, but the ivy was not disturbed. All defective stones have been made good. The old lead roof was entirely stripped off, and a new lead roof substituted. Defective woodwork was removed from the tower roof and oak beams have been inserted. The floor of the belfry or clock-loft was found to be decayed and replaced by a new English oak floor. The window lattices have been renewed and bird guards added. The steps leading to the tower have most of them been remade in cement. The pinnacles were not restored. When the plaster was removed the whole of the north side was found to be in a deplorable state, incapable of restoration. The wall, which had been built without a foundation, was pulled down as well as an unsightly, small, red brick north porch. The north wall has been re-erected, using the old materials on a 3ft. concrete foundation. As there was no vestry in the church opportunity has been taken to extend the north wall so as to provide for the erection of the present vestry and organ-chamber. To allow of this an old square window, said to be of no architectural value, was not replaced. The small window, said to be from Saxon times and which was high up in the wall, has been moved to its present position. The present north porch has also been added. The north wall of the chancel, as already indicated, was rebuilt; the east window, which was completely awry, straightened, and defective stonework made good, the east wall not being interfered with. The chancel had an inner ceiling which in part hid the east window. This ceiling has been removed and the chancel opened out. The plaster has been taken off the walls, showing the priest's door, the blind window above it and the aumbry. These have been opened out and the walls replastered. It may be stated that the church walls, being built of rubble, could not be pointed inside and had to be replastered. No piscina was found. It was expected that the north roof would be found in a bad state, but this was not the case. The architect decided, therefore, to keep the present barn-roof, and the few defective beams were replaced by new ones. The entire church roof was thoroughly examined. The slates, which had been fastened by wooden pegs, have been relaid and fastened with metallic nails; defective stone ridges have been removed and replaced by new. New spouting is fixed throughout. The four windows in the chancel, the window in the vestry and the window in the north side have had their stonework repaired and the glass set in new lead flashings. In the case of the other five windows the glass has been renewed where broken. Much of the stonework and the whole of the lead flashings of these windows is in/a very defective condition. As to the interior, the stonework, the arches and the pillars of the church were covered with disfiguring paint or distemper. This has been hacked off and the stonework exposed. All defective stonework has been made good and the joints pointed in cement. This restoration has greatly improved the appearance of the church. The pews, during the restoration, received a good deal of injury but were restained and varnished in 1900 in dark oak colour. The lighting has been much improved by the addition of 100-candle-power brass lamps, and new stoves have been put in for heating. The holy table and reredos are the gift of Mr. William Hill Foster, builder, of Southport. They are in massive carved oak. The stained deal holy table of 1842 has been removed and the present holy table substituted. About the same time the two chancel chairs, in oak, and a new carpet were added. The organ, which proviously had stood in the north aisle, has been retuned and moved to the new organ chamber. The chancel pews and panelling, placed in 1842, have been taken away and chairs substituted and arranged to receive the choir. The pulpit has been remodelled and repaired, rendering it almost new. The carved panels of the pulpit are the work of a previous vicar, the Rev. H. Tibbs. The polished oak chair at the reading-desk is the gift of Mr. Foster; and the oak lectern of Mr. Reeve, estate carpenter, who also made the reading-desk. The churchyard wall has also received considerable attention. The work has cost about £1,200.

THE PROTECTION OF WESTMINSTER ABBEY FROM LIGHTNING.

MR. KILLINGWORTH HEDGES, C.E., was some time ago asked to report on the arrangements hitherto made for protecting Westminster Abbey against lightning. As in the case of St. Paul's Cathedral, he found that the number of conductors was quite inadequate to the size of the building, and that they were not even in a satisfactory condition. He was, therefore, instructed to design a new system. This is now complete, and with the exception of the Chapter House—upon which the Office of Works, as the custodian, was unwilling to spend the small sum required to provide the necessary cable—the buildings of the Abbey are now, perhaps, as well protected as possible against the dangers of lightning.

The installation provided by Mr. Hedges is on the air-to-earth system, and consists of ⅜-in. seven-strand copper cables, which are carried horizontally along the apex of the roof of the nave and transepts and continued over Henry the Seventh's Chapel. From these cables are led similar conductors to the towers, lantern and other higher parts, and thence downward to the earth, the conductor being strained through special holdfasts, at a distance of about 6in. from the structure. The horizontal conductors are furnished with about thirty four-point aigrettes, fixed about 30ft. apart. Each aigrette is made of four pieces of solid copper and is united to the conductor by means of a special joint box containing pockets, in which the rods and cable are placed. The box is afterwards filled up with solder. All the joints are similarly finished, and it is considered that they may reasonably be expected to last as long as the cables, while the electrical conductivity of such joints is not likely to be lessened, as it would be in the case of ordinary joint soldering.

Westminster Abbey is built on sand of a particularly dry nature. Therefore, to obtain slow resistance, a small pipe has been laid from the earth to the nearest rainwater spout, and so placed that rainwater will be deviated in sufficient quantity to keep the charcoal moist in dry seasons. The tubulous earth—first used at St. Paul's Cathedral—was employed in some cases where there was not space enough to lay a copperplate. A ¼-in. solid copper wire protects each of the pinnacles by which the structure is surrounded, the wire being attached to a small general conductor laid horizontally on the lowest roof and connected with the lead roofing. The object of this arrangement is, first, to assist the dispersion of the so-called "negative" electricity collected at numerous points on the building; and, secondly, to provide so many good conductors to earth that, should any portion of the structure receive a direct lightning stroke—no matter what side flashing or surging might take place—the danger to the edifice would not be serious if the earthing arrangements were always kept in order. This important work has been carried out by the Abbey staff, under the direction of Mr. Hedges, acting as Consulting Engineer.

THE NEW GOVERNMENT OFFICES.

Mr. Leonard Stokes again in the Lists.

THE most recent addition to the discussion relative to the new Government Offices now being erected in Whitehall is a further letter from Mr. Leonard Stokes to the "Times" correcting the inspired article by a "correspondent," which we published and commented on in our issue for September 11th. Mr. Stokes says:—

First, I fear your correspondent can hardly be any judge of architectural matters at all if he really thinks the Record Office in Chancery Lane "one of the most beautiful (buildings) in London"; far from being so, it is really one of the most childish productions of modern times externally and internally. If rooms 20ft. high constitute the perfection of comfort when provided for two or three clerks, then perhaps it may be "perfect for the purpose for which it was designed," as stated.

Your correspondent seems to think architecture is all "a matter of taste," but he is quite wrong, for there is good and bad in architecture, as in other things, quite apart from taste; and I repeat that the Record Offices are thoroughly and unmistakably bad, and this opinion I am prepared to back against your correspondent's, whoever he may be, and we can refer the matter to any qualified judge or judges he may like to name.

Your correspondent again shows his want of knowledge when he states that had Brydon lived the rest of his "commission" would have gone in remunerating subordinates. This is too absurd for anything. Had Brydon lived every single detail about the building would have been either drawn by his own hand or under his direction and supervision, and I venture to state that not more than about one-tenth of the remaining "commission" would have gone to subordinates, for he kept but a small staff, preferring to do his own work; and here we have just the difference between a public office, like the Office of Works, and a good private office. In the former subordinates do the work, as pointed out by your correspondent, while in the latter the principal does it himself.

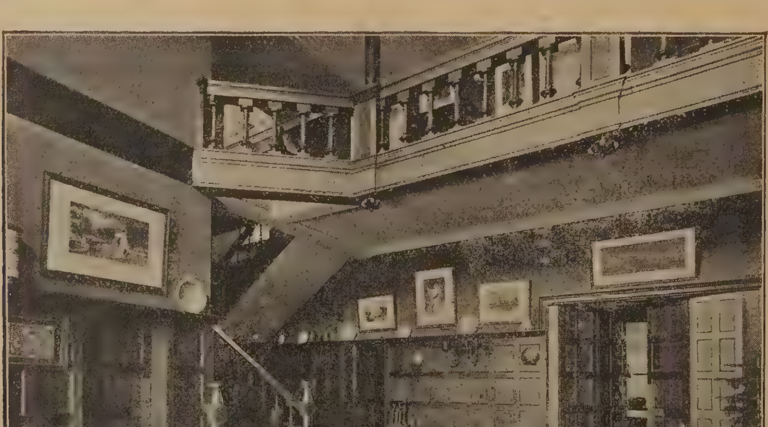
Street himself drew every single detail in the Law Courts, and the details are all good. The building as a whole perhaps may not be all it might have been, for this reason, that the Office of Works had control over Street. I have always been told that the Office of Works are responsible for the Courts being on the first floor (the one great mistake in the design), and I know that on Street's original drawings he had provided for heating and ventilating the building; he was, however, told by the Office of Works that they would see to such matters later on, and he was not to provide for anything of the kind; consequently when the building was almost finished it had to be fearfully cut about, at great expense, to introduce the Office of Works' "system of heating and ventilating." Those who use the building know the result and blame Street; and Brydon will get the "credit," your correspondent informs us, for the design of the new Government offices, after it has been detailed by a staff of subordinates similar to that which detailed the "beautiful" Record Offices!

A dead man's reputation and memory are dear to his friends, and as Brydon's friend and executor I decline to have any such "credit" laid at his door. The Office of Works cannot detail the building so that it will be any credit to Brydon's memory, any more than the officials of "South Kensington" could finish a portrait left, say, two-fifths completed by Rembrandt, for there is individuality in architecture as there is in painting, music, and every other art.

A good deal was at one time made of the fact that Brydon's head draughtsman had been engaged by the Office of Works to help to complete the building as Brydon would have finished it; this young gentleman is now working under a weekly engagement at the Office of Works, and is with others engaged in altering already Brydon's design, which your correspondent assures us it is the principal desire of the First Commissioner to see carried out as Brydon left it. Your correspondent however says nothing about this, and he also repudiates the saving of expense theory, and produces for the first time another, viz., that no really eminent outside architect could be found to finish Brydon's design, and that if an outside architect were employed, "it would have to be a man of the second or third rank in his profession." Here again I think your correspondent must be quite wrong, and I cannot believe any outside architects were ever approached at all. Even if they have been, and they could not see their way to sink their own individuality, as your correspondent says, I venture to state that it would be far better for the building, its owners, the public, as well as for Brydon's memory, to have it finished by an architect of even second or third rank than to let it fall into the hands of the subordinates named by your correspondent, none of whom, I fancy, are equal even to an outside architect of second or third rank.

When it was decided to build South Kensington Museum, the War Office buildings, and the new Government offices, the idea was to appoint an outside architect to each, with Sir John Taylor as architectural representative of the Government to keep an eye on them and to look after the "comfort of the occupants," as your correspondent puts it. Out of the three architects appointed, Mr. Aston Webb, A.R.A., is the only one left living, and he, with Sir John Taylor as above explained, is carrying out South Kensington Museum. Mr. William Young, who was appointed to do the War Office, died some months ago, and the Government appointed his son, Mr. Clyde Young (an outside architect), to complete his father's work in conjunction with Sir John Taylor. And now Brydon dies, and the Government for some unknown reason depart from their original idea (upon which they are still acting for the two other buildings) and propose that one Office of Works official, Mr. Henry Tanner, in conjunction with another, Sir John Taylor, should nominally complete the new Government offices in Parliament Street; but that subordinates should really do so!

The council of the Royal Institute of British Architects protested against this proposal without effect. Mr. Emerson, the president of the R.I.B.A., has also written to you on the subject, as well as Professor Aitchison, R.A., and your valuable aid has been further given in a leading article, and yet there is no sign of the Office of Works relenting, but instead your apparently inspired correspondent sends to you the communication you print, a communication, I venture to think, most unsatisfactory in every way, and particularly in those points I have ventured to call attention to.



THE HALL, HOUSE AT BURLEY-IN-WHARFEDALE.

School Extension at Southport.—An addition has been made to the Wennington Road schools of All Saints' parish, Southport. The building, designed by Mr. Jones, architect, of Southport, consists of a large schoolroom with three spacious class-rooms grouped in a compact and convenient manner, with separate exits, so that each can be cleared without disturbance to any other adjoining room. They may all be thrown into one for parochial purposes, and will then accommodate 800 persons.

NEW ISOLATION HOSPITAL AT FORFAR.

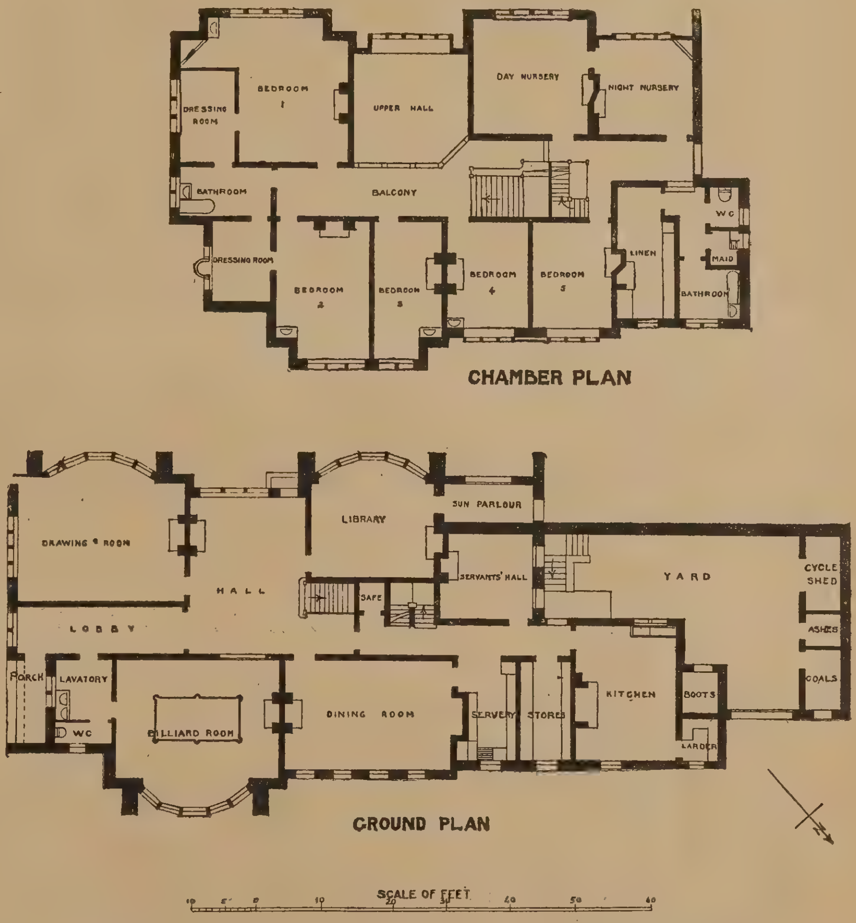
A NEW infectious diseases hospital has been built at Whitehills, Forfar, for the Dundee and Forfar Districts of the Forfar County Council. The buildings consist of a large administrative block, with matron's parlour and bedroom, doctor's room, nurses' dayroom, kitchen and stores on the ground floor, and four nurses' bedrooms, two servants' bedrooms, napery, two bathrooms on the first floor. On the east side of the administrative block is placed the isolation block, having two wards of one bed each, with nurses' room, bathroom, &c.; and to the west of the administrative block is the discharge block, with undressing and dressing rooms, bathroom and stores for patients' clothes. Along the high ground to the south-east of the administrative block is placed the scarlet-fever block, having two wards of eight beds each, and two wards of one bed each for acute cases. The nurses' rooms and pantries are placed between the wards while the baths are placed in annexes at the end of each ward, connected with the main buildings by through ventilated passages. South-west of the administrative block are placed the typhoid and diphtheria blocks, having two wards of two beds each, with nurses' rooms and other conveniences. The offices are placed at the south end of the ground, out of sight of the other wards, and consist of mortuary, ambulance sheds, toolhouse, wash-house and ironing-room, disinfector and boiler-house, coal stores, and other conveniences. The blocks have been placed on the highest ridges of the ground, about 60ft. apart, and the intervening ground made up to an even surface between. The main entrance is from the north, and a macadamised road runs through the grounds to to the south entrance, while carriage sweeps are formed opposite each block and connected with the road. Granolithic footpaths lead from the nurses' entrance in the administrative block to all the other blocks. Gas lamps are erected throughout the grounds for the convenience of the night service, and fire hydrants are placed in conspicuous positions opposite the various blocks. The drains are in straight lines, and provided with manways and inspection eyes at at any change of route or level. The grounds have been laid out with the view of preserving as nearly as possible the natural contour of the ground. The interiors have been fitted up with every modern convenience to ensure the comfort of patients and nurses. Telephones connect the various wards with the administrative block. The whole ground is enclosed by a substantial stone wall averaging 2ft. high. The contractors for the various works were as follows: Messrs. James Cargill & Co., builders, Forfar; Messrs. Alexander Hay & Co., joiners, Forfar; Messrs. William Brand & Sons, slaters, Arbroath; Mr. D. Brown, plumber, Dundee; Mr. D. Masterton, plasterer, Forfar; Mr. J. H. Douglas, glazier, Montrose; Messrs. Thomas Bradford & Co., laundry engineers, Manchester; Messrs. A. Westwood & Son, bells and telephones, Dundee; gas main—Messrs. William Mitchell & Son Dundee; water supply—Messrs. William Mitchell & Son, Dundee; drainage—Messrs. J. Gray & Sons, Newtyle; locks and furniture—Messrs. Eadie & Kininmouth, Forfar; painter work—Messrs. Doig & M'Phee, Forfar; boundary walls—Mr. James M'Lean, Forfar; laying out of grounds—Mr. P. Girrity, Dundee; ventilation—Messrs. R. Boyle & Sons, Ltd., Glasgow; grates—Messrs. G. H. Nicoll & Co., Dundee; gates—Mr. A. M'Call, Dundee; furniture and furnishings—Messrs. Thomas Justice & Sons, Ltd., Dundee. The clerk of works being the late Mr. D. Kidd, Mr. Drummond has acted as clerk of works since Mr. Kidd's death. The whole works have been carried out from plans and under the superintendence of the architect, Mr. T. Martin Cappon, F.R.I.B.A., 130, Reform Street, Dundee. This hospital is one of the most complete of its kind, and will compare favourably as regards cost per bed with any similar structure in Scotland. The Local Government Board, when passing the plans, made a very complimentary reference to the planning and arrangement of the building, which, from all accounts, appears to have been carried out in a very creditable manner.

GARDEN CITIES.

THE BIRMINGHAM CONFERENCE.

A CONFERENCE was held at Birmingham on Friday and Saturday last in connection with the Garden City Association. Mr. Ralph Neville, K.C., who presided, explained the objects of the conference, after which a discussion took place on the advantages which attend removal of works from large cities to new districts; how difficulties may be overcome, and the evils of overcrowding in large cities and depopulation of rural districts checked; and how local authorities and building and co-operative societies can best assist in such movements. The following resolution was carried:—

"That the Conference recognises the great evils which arise from bad housing conditions; urges local authorities (and particularly the Local Government Board) to put in force the Housing of the Working Classes Acts of 1890 and 1900, and borrow money for the purpose of acquiring land and erecting cheap and good houses for the people; and draws the attention of such authorities, and of building and co-operative societies, to the opportunity which presents itself to them to carry out housing schemes for the benefit of the workers when factories are about to be established in new districts."



HOUSE AT BURLEY-IN-WHARFEDALE. ADKIN AND HILL, ARCHITECTS.

A discussion then followed on the Garden City project. We have already devoted considerable space to this matter and fully explained the details of the scheme,* but for those readers who have not read these particulars we may say that the chief features are: (A) A concerted movement on the part of manufacturers, co-operators and others to new areas; (B) The increased value of the land to be vested in the community; (C) The areas to be carefully planned in accordance with the best known principles; (D) Plenty of open space to be set apart for all time, so that overcrowding may be avoided in the future.

The following resolution was adopted by the conference:—

"That the housing problem can be solved and the congestion in crowded centres relieved by a concerted movement of manufacturers, co-operators and others to new areas, arrangements being made for securing to the people the whole of the increased value which their presence will give to the sites, and the areas being carefully planned so as to make adequate provision for the individual and social needs of thy people, especially with a view to securing for all time the combined advantages of town and country life."

On Saturday a visit was paid to Bournville, whence Messrs. Cadbury have removed their works from Birmingham. A description of the buildings will be found on page 159 of our issue for April 3rd last. After the tour of inspection had been completed a conference was held, over which the Right Hon. Earl Grey presided. Papers by Mr. Ralph Neville, K.C., chairman of the council of the Garden City Association, on "Co-operation in Garden Cities"; by Mr. Ebenezer Howard on "Manufactures and Labour in Garden Cities"; by Dr. Winslow Hall, M.R.C.S., on "Public Health in Garden Cities"; by Mr. H. Clapham Lander, A.R.I.B.A., on "The Advantages of Co-operative Dwellings"; and by Mr. Raymond Unwin, M.S.A., on "The Building of Houses in the Garden City"—were discussed in detail.

The general tone of the remarks may be gathered from the leaderette which appears on page 101 of this issue.

Change of Address.—In consequence of the houses on the south side of Great College Street, Westminster, abutting on Abingdon Street, being scheduled under the London County Council Embankment Improvement Scheme, Mr. Arthur H. Ryan-Tenison, A.R.I.B.A., is removing his chambers to 12, Little College Street, Westminster, S.W., where he will be located on and after the 29th instant.

WHAT CONSTITUTES BEAUTY IN ARCHITECTURE.

BY BARRY PARKER.

MR. BARRY PARKER recently delivered a lecture (in two parts) at the Glasgow Exhibition before the International Association for the Advancement of Science, Arts and Education, under the main title of "Wherein Beauty and Architecture lies," and the sub-title of "Placing of Light and Shade, Detail, Masses and Ornament."

Mr. Parker said that he had been led to the choice of this subject by a feeling which had grown upon him more and more, year by year, that those interested in the development of the knowledge and perception of truth in art do, in their attempts to help one another, almost invariably miss what is perhaps most important. Anyone setting out to help others to a knowledge of architecture, whether it be to train students with a view to their practising it as a profession or with the aim of guiding others to some understanding of what they see, always approaches his subject from some point of view other than that of trying to show them some main principles or guiding instincts which have led to beautiful results in all styles and periods, and at all times, throughout the history of the art.

SEMI-DETACHED HOUSES AT HEATON, BRADFORD: SOUTH FRONT. ADKIN AND HILL, ARCHITECTS.

He teaches his pupils building construction; he teaches them architectural drawing; he teaches them any amount of the history of architecture, its development from style to style; or even some abstract mathematical system of proportions, to their infinite and irrevocable loss of ability for any broader grasp. He teaches them the art of planning economically and conveniently; perhaps even the adaptation of the architecture to the climatic conditions of a country, and the habits and mode of life of a race. He will probably go so far as to state that he feels this building to be beautiful and not that, but does he ever attempt to teach wherein lies the beauty of the one and the failure of the other?

Mr. Parker did not ask that the teacher should point out why the attainment of beauty lies in the recognition of this or that broad principle or æsthetic instinct; that would, he said, in most cases, be beyond what it would be fair to ask. But by a thoughtful comparison of many buildings belonging to all styles and all periods he could discover and point out right instincts, always followed, and factors always duly valued in successful work the world over—in fact, wherein the beauty of a building lies.

He went on to point out that this absence of any attempt to create a power to analyse into its constituent elements the beauty of one building, and to see what has led to the absence of beauty in another, was another characteristic of our art training to-day, which made for the increase of that army of copyists (incapable of the least originality) by which the progress of the art of architecture is so lamentably hindered. For he who has merely seen that one building is beautiful and another not, and has never approached either with any attempt to discover the qualities making for success or failure, will have no idea of doing anything more than reproducing what he has seen to be beautiful as slavishly as the new conditions in which he is placing it will admit. He will have no power to see that he commands the qualities which have made for success.

From his want of power to analyse the beauty of his model into its constituent elements he will be certain so to adapt it to its new conditions as to destroy that beauty. Mr. Parker showed on the screen photographs and sketches of many European buildings, pointing out how the disposition and placing of the main masses of light and shade must take precedence of all other questions if beauty, and not entire loss of dignity, is to result. He demonstrated the truth of this by showing various examples of buildings where there was no massing of light and shade; the light was all broken up, and the shade was all broken up and spread in little patches and strips universally over the whole building. He went on to show that to gain beauty it was necessary there should be not merely restraint in the use of detail, and a sense of fitness in the parts selected to be finely detailed, but the right perception of the way in which the detail should be concentrated or grouped. "No truly happy effect ever was or ever can be produced where small and great are disposed universally over the whole surface of a building, and where no thought is given to the enhancing of the light parts and details by opposing them to the massive, the broad and the simple, where all parts are equally enriched, whether greatly or slightly, with mouldings, ornament, colouring, or in any other way, as is the case with so many modern buildings in which all enrichment is spread, profusely or sparsely as funds allow, equally over the whole facade."

He deplored the loss of power to rightly value plain surfaces, and showed by means of the lantern how much of the beauty of the work of the past resulted from due appreciation of these.

By means of a sketch of a window in Florence he had recently made for this purpose, and a photograph of a pulpit in Milan, and another of the Duomo in Florence, he showed how rightly to meet the differences in ornament demanded by considerations of distance from the spectator; how only vulgarity resulted from simply magnifying ornament because it was to be seen from a distance, and only irritation in the beholder by so designing that it could not be properly seen; how a truly happy result could only be got by designing ornament which was to be seen from a distance, simple but refined in detail, avoiding above all things multiplicity of different forms, that it may be easily grasped from a distance and satisfactory on close inspection.

Not the least interesting part of these lectures was that treating of the province of design in bringing into harmony the works of nature to the works of man; the province of design in introducing growing forms among architectural forms, and architectural forms among those of wild nature; the due fusing of the one into the other, and the softening of the abrupt contrast by frankly acknowledged art.

Finally, among the main principles in design which Mr. Barry Parker laid down as forming as it were the framework, he laid great stress on the following: "Everything anyone is called upon to design has certain clearly defined requirements, purposes and conditions, and the form must be given it which will best enable it to fulfil these before any other considerations may be entered upon. It is doomed to certain artistic failure if, from mistaken notions of the dictates of æsthetics, it is given a form which will make it less able to perform its functions than would some other form; and the ability and inability of the designer is shown in the degree he makes it satisfactory to our æsthetic instincts, while at the same time he enables it to perform its functions asp erfectly as possible." He also emphasised that its form must at the same time be one which revealed and explained the construction: not one which attempted to conceal it. An illustrated volume of lectures by Mr. Barry Parker and Mr. Raymond Unwin will, we understand, be published by Messrs. Longmans, Green & Co. early next month.

IMPROVEMENTS IN THE HOUSE OF COMMONS.

THE Select Committee of the House of Commons which was appointed in March last to consider "whether any and what arrangements can be made to improve the accommodation provided for the general use of members of this House" have just made its report. The Committee recommend improvements intended to increase the comfort of the ladies listening to the debates as well as of the members themselves. The great smoking-room grievance is to be redressed. "It has been given in evidence and indeed it is a matter of common knowledge in the House," says the Committee "that the members' smoking-room on the main floor is always inconveniently crowded and very hot." It is hoped to lessen the heat by reducing the temperature of the kitchen underneath. The Committee recommends that the present members' smoking-room be used as the strangers' dining-room; that the present middle dining-room be reserved for members only; and that the third dining-room, next to the House of Lords, be used as a smoking-room. Three large rooms fronting the Terrace are to be reserved, two for smoking and one for reading. Hearing that "great inconvenience is caused to members for want of dining accommodation," there being room for only 140 diners while often 300 dinners have to be served, and members thus have to wait their turn at the tables, the Committee recommends two new dining-rooms on the Terrace front, to one of which ladies should be admitted. A ladies' retiring-room will also be provided. The "Times" reporters' room is to be added to the refreshment-room of the Ladies' Gallery, and the defective ventilation of the Ladies' Gallery is to be the subject of remedial experiments. The Committee thinks consideration should be given to the need for more dining space for the Press Gallery, and it recommends improvements of the accommodation for the telegraphic staff, for lady typists and members' secretaries, various alterations in the kitchen, and the opening of a refreshment bar for the messengers and subordinate staff of the House. The question of the inadequate ventilation of the Committee rooms is also dealt with. The report urges that this matter should be deal with without delay, so that the improvements may be completed before next Session. The total cost of the improvements is estimated at £30,000 and it is strongly urged that the recommendations embodied in the report be carried out as soon as possible.

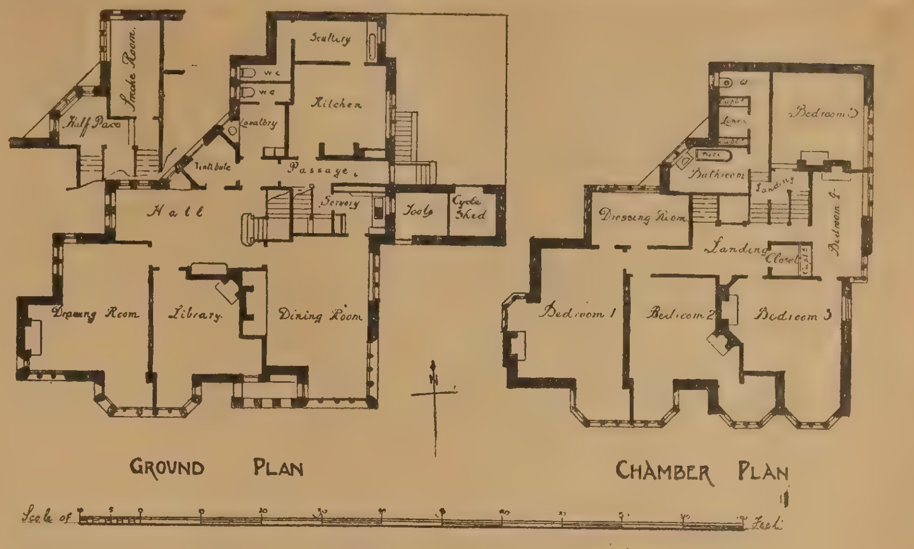
The Ellison Schools, Gateshead, have just been altered at a cost of £7000. The alterations have added several rooms to the building and provided a hall for large meetings. The place has also been furnished and the lighting and ventilation attended to.

THE BRITISH ASSOCIATION.

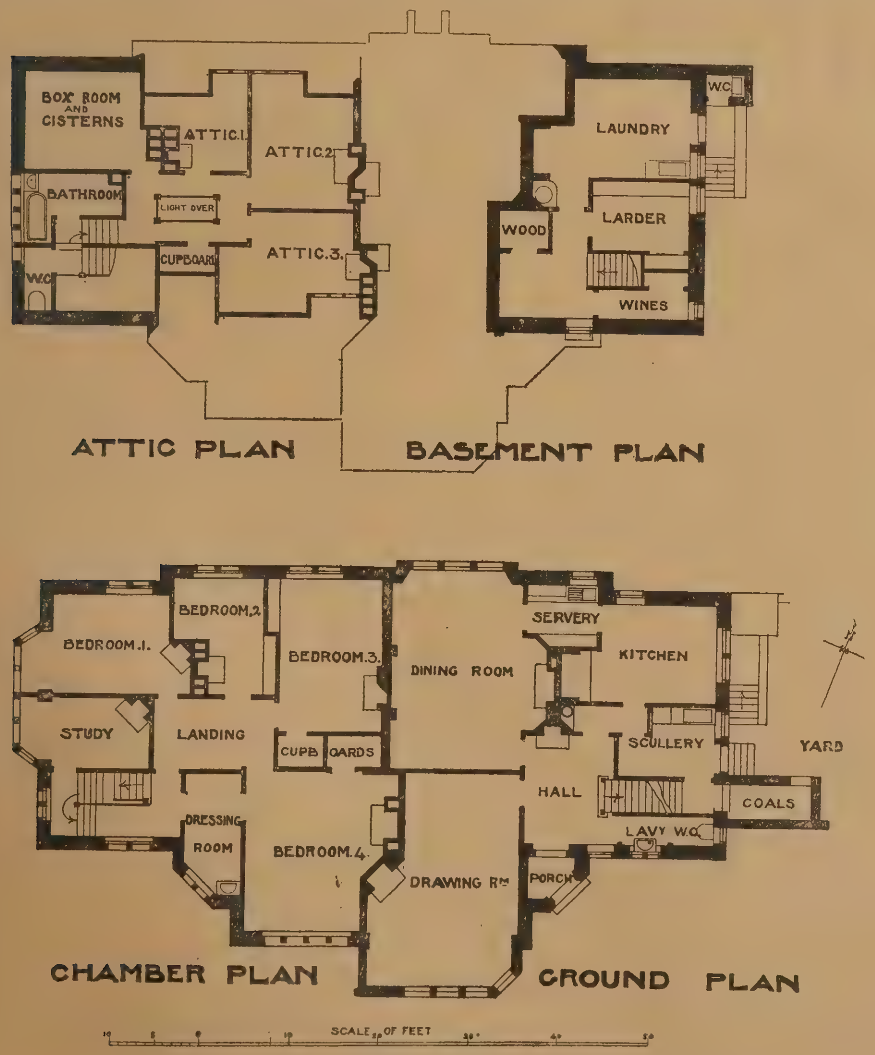
THE meeting of the British Association at Glasgow was concluded last week. On Monday, September 16th, in the Mechanical Science Section, Mr. Killingworth Hedges, M. Inst. C.E., read a paper on

The Protection of Buildings from Lightning.

He said the last time the subject was brought before the British Association was in 1888. Sir William Preece then opened the discussion by saying that is was a most remarkable thing that if one wanted to know much about atmospheric electricity one had to go back to the works of Benjamin Franklin, 140 years ago. Up to the year 1881 there was not even a code of rules in the United Kingdom to guide people in protecting their buildings from the destructive effects of atmospheric electricity. To the efforts of this Association they owed the first set of rules. The history of the art since then had been one of stagnation. Distinguished scientists, like Professor Oliver Lodge and Dr. Weber in Germany, had put forward their views from time to time, but still they saw conductors erected in a manner which could be shown both by laboratory experiments and by actual reference to lightning strokes to be a source of danger instead of acting as safeguards to the buildings; also, the misleading belief of an area of protection was the cause of the erection of an isolated rod, for instance, on a church tower, while the rest of the building had no conductor, or, what was more important, no metallic connection to earth. Interest in the subject had been again revived, first in Germany by the Electro-Technische Verein of Berlin, who, after much discussion, published on July 21st of this year a set of rules and recommendations on the protection of buildings; and in this country they had the Lightning Research Committee organised in January last. Setting aside the opinions of those who considered it was cheaper to insure than to spend money on protection, he pointed out that even architects dismissed the question by a short note at the end of their specifications —"Provide a proper lightning conductor," without a word as to where it was to be placed, and, what was more important, how it was to be connected to earth. Insurance offices, too, seemed to ignore the question of protection altogether, as no difference was made in the rate per cent. on a building scientifically protected, those on which there were, perhaps, one or two lightning rods, and other structures without any conductors at all. An insurance surveyor told him that he thought there was little to choose in the two latter risks if the conductors, as was too often the case, were allowed to get out of order; but to say that it was impossible so to protect a building, that the risk of lightning was not reduced to a minimum, was to confess that they in England were far behind Continental nations in the attention which had been paid to this subject. He then gave an account of his rearrangement of the system used at St. Paul's Cathedral, where the conductors, erected as recently as 1872, were found to be totally inefficient, both as regards the conductivity of the joints and the resistance of the earth connections. In the plan recommended, both for this installation and for the more recent one at Westminster Abbey, the number of ordinary conductors from air to earth had been greatly increased, and, besides these, horizontal cables were run on the ridges of the roofs and in other prominent positions so as to encircle the building, being interconnected to the vertical conductors wherever they cross one another. The horizontal cables were furnished at intervals with aigrettes, or spikes, which were invisible from the ground level, and were designed to give many points of discharge. At the same time they, in conjunction with the cables, would receive any side flash which might occur should any portion of the building receive a direct stroke of lightning. The unreliability of soldered joints for conductors, whether of cable or tape, had led him to design a special joint box, which could be applied for uniting any portion of the system together in such a manner as to give great mechanical strength as well as good electrical contact; at the same time any box could have points inserted so as to form an aigrette in any desired position. Owing to the difficulty of sinking an earth plate of sufficient area, on account of old foundations, a special form of tubular earth had been designed which took up little space and had the advantage that if a suitable moist ground was not obtainable the desired low electrical resistance was attained by leading a tube in connection with the rain-water pipes, so that a portion of the rainfall was diverted to the tubular earth. In isolated private houses it was well to run a small copper wire up each of the chimney stacks and connect all these conductors with a horizontal cable, which might, if the run was long enough, have short aigrettes. The earth conductors were led downwards from each side of the roof. If suitable arrangements could be made when a building was being erected, a modification of the American system of using gutters and water pipes as the conductors could be adopted, and would then add only a nominal cost to the fittings usually supplied. As to what should be done generally, he recommended that joints should be avoided when possible, and also sharp bends and roundabout paths to earth. A conductor detached from the building was safer than one in close contact with it, and it should be kept a short distance from the building by means of supports, which must not be insulated. If joints were necessary the stranded wires must be spliced and soldered and tapes must be riveted and soldered. Tee and other connections



RESIDENCE AT ILKLEY. ADKIN AND HILL, ARCHITECTS.



HOUSES AT HEATON, BRADFORD. ADKIN AND HILL, ARCHITECTS.

and the union of air terminals or aigrettes to the cable should be made by splicing or careful binding and then protecting the joint by a metal box which was to be filled with hard solder. All flagstaffs should be protected by a conductor projecting a few inches above the top. If the pole was on a metallic roof, this should also be connected to earth. A building once struck was liable to be again damaged, and special care should be taken in protecting it. Our cathedrals and museums were of national importance, and if it was found necessary on the Continent to have a thorough system of protection and frequent inspection surely it should be done here, as the initial expense could be spread over a number of years, and the annual upkeep would be sufficiently provided for by a one per cent. rate on the sum spent for structural repairs. The Lightning Research Committee were collecting facts by means of the assistance of observers throughout the country who were qualified by position and training, and when a sufficient number of observations were recorded it was thought that the science of the matter would be much more advanced than by trying to theorise too much on the imperfect knowledge and facts which they possessed at present.

Mr. Hedges, in reply to criticisms, said he had recommended keeping away the conductor from the building because that was the plan generally adopted on the Continent, where lightning storms were much more frequent than here. He agreed that architects might get puzzled if one thing was recommended and then another, and he should prefer not to put down any rules as absolutely definite until they had more results from the observers dotted all over the country in connection with the Research Committee.

Bridges in China.

Mr. R. Lockhart Jack described a number of bridges in the provinces of Szechuan and Yunnan in Western China. There was, he said, reason to believe that the form of the bridges found in these provinces was evolved locally, although much of the decoration was distinctly of Indian origin, and was no doubt introduced with the Buddhist faith. The Chinese had learned to use their materials with considerable skill, and a thorough investigation of their handicraft possibly would reveal whether they had developed a formula for their guidance or whether by long experience their bridge builders had learned to turn out good work by empirical methods. The subject as a field for scientific investigation was untouched, and would certainly yield results of great interest when compared with mediæval and modern work in Europe.

On Tuesday, September 19th, the President, Colonel R. E Crompton, M.Inst.C.E., intimated that in response to an invitation several members had made an inspection of

The Glasgow Harbour Tunnel,

and had been much interested. Sir Frederick Bramwell said he had had the pleasure of going over the works. As compared with the long approaches of, say, the Blackwall Tunnel, this mode of dealing with traffic was most satisfactory and he believed it would be much cheaper in the end. He only wished the London County Council would thoroughly investigate the matter. Professor Barr said the nominal financial success of the scheme ought not to be judged as an objection. Until a few years ago there was very great difficulty in crossing the Clyde at this section, but a horse ferry had now been provided, and had taken up a great deal of the horse traffic, while the Glasgow District Subway carried the great bulk of the passenger traffic. These local circumstances accounted for the fact that the scheme was only a partial financial success, and he was convinced that at other places and in other circumstances this method of dealing with traffic would prove entirely successful from a financial point of view.

Mr. J. W. Thomas, F.I.C., F.C.S., spoke of alternating air currents and down-draughts in churches and public buildings. He pointed out that down-draughts were not continuous in high buildings, but that the cold air falling from the top of a high building compressed the layer of air beneath, and, owing to the elastic properties of air, it remained stationary near the floor of the building for some seconds and afterwards an up-current was formed, the result being that alternating air currents were produced at intervals of about half a minute. The pressure of the outer air when falling down a building at freezing point caused the pressure of the air inside the building to be increased greatly, whilst during the up-current the pressure was reduced to its lowest limit. Alternating air currents upset the ventilation of high buildings with too much top exit space, and caused the products of respiration to be breathed over again.

This closed the proceedings of the section.

On Tuesday in the Botany section, Mr. Samuel Margerison read a paper on

The Transport of British Timber.

He said that in this country it costs about 5d. to grow a cu. ft. of fir timber. On the average it cost about another 5d. or 6d. to get it into the market, and it sold for 8d. to 9d. per cu. ft. The chief reason why it sold for less than cost price was that foreign fir was sold at the figure specified and the growers and importers could make it pay. He had selected fir as an extreme case in order to emphasise the fact that the handling charges on home-grown timber were much higher than those on imported timber of the same species. We could grow Scots fir and spruce practically as cheaply as the Continental forester, but we could not afford to sell it at the same price, and at the same time compete on equal terms with him, because it cost us more to transport it from the plantation to the consumer, sometimes even when both were in the same county. Preferential railway rates in this country were costing timber growers nearly as much as the rental value of the land on which the timber was growing. Why was there this great check upon the efforts to make "forestry pay?" One reason was that foreign timber imports were handled generally in larger quantities so that detail work was done more cheaply. But it was not only in railway charges that our expenses were higher. The over-land carriage cost us more. We had not the advantage of water-shoots and great rivers, or sufficient snows and frosts to make water or ice a generally available means of transport. Could these overland forest to railway handling charges be reduced? He had made some inquiry about tramway and other mechanical appliances but did not see any advantage to be gained from them under the conditions ruling in this country. The chief drawback to their use was that our small and scattered plantations would not pay for the profitable employment of costly plant and machinery for transport. A tramway, cheap as it was in working, was costly in instalment and would, in a large number of cases, be much dearer than the present system of removal by horse waggons. Besides, public roads would have to be used and crossed, and county councils would not be ready to allow this. Under favourable circumstances, again, traction engines would effect considerable economy in haulage. A load of 12 or 15 tons might on some roads be carried for less than one of 3 or 4 tons drawn by horses. But good roads did not often penetrate into the woods, and there were weak bridges and sharp corners to contend with, which would not be negotiable with long heavy loads such as would be required to use the full available power. The pole-waggon at present in use, drawn by horses, was the best appliance at present in existence for collecting timber from our comparatively small timber areas in the first instance. But if we could have partial conversion of the timber at centres close to large areas of timber, we could considerably cheapen the cost of transport, both by using traction engines and tramway for the local work, and traction engines for "through" traffic to reasonable distances. There was no gainsaying the fact that native timber did, on the whole, cost somewhat more to transport than foreign. It was often in clumsy, dangerous forms, crooked and knotty, whilst imported timber was generally wholly or partly converted into tidy, straight pieces, making more compact and firmer loads. And, being dealt with at ports in larger quantities at one place, much of the work was centralised and specialised, with the result that there was a large saving in details. Whilst persevering in the efforts which had been made of late years to improve our forestry, it behoved growers to pay special attention in future to the relation of transport to concentration of production, the producing of timbers on the higher values, compactness of loads and regularity of supply of consignments.

Correspondence.

Domestic Architecture.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Have you observed the coming revolution in domestic architecture as set forth in the "Daily Mail"? Have you noticed the "new construction" in our £10,000 article, where arches appear without abutments and stone gables rest on glass? One assumes a chapter "on the constructional use of window panes." You will observe all our goods are marked with plain figures. Our cottage style with ingle and seat we can do you for £200. Our "Swiss Chalet" style, which has had a great run, comes a *leetle* more expensive. It is marked, you will see, £500, subject of course to the usual discount. No, we do not include the cut hedge with arch. Something a little larger? Here is a very superior article indeed at £10,000, in which we have introduced the "New Construction." No, it is not imported from America; it is of home manufacture. I assure you, madam, all the work of our Mr. De Parcy Sharper. But, excuse me, did you not tell me just now that Mr. De Sharper was an architect? Quite so, madam. But I thought architects were not supposed to advertise? Ah, madam, that was before the revolution in domestic architecture. We have changed all that now!—Yours truly,

M. H. BAILLIE SCOTT.

A NEW CHURCH AT DUNDEE.

A NEW episcopal church at Strathmartine, Dundee, is being erected in Baldovan Road. It will accommodate 200 persons, and will be built of rough cast local stone with stone coigns and dressings. The length will be 104ft., the greatest breadth 25ft., and the average height up to the ridge 30ft. The general style is Late Decorated, with square-headed, traceried windows along each side, and somewhat elaborate traceried windows east and west. The design has been kept extremely simple, the only ornament on the outside being the tops of the buttresses which divide the chancel. It is to be roofed with the old-fashioned characteristically Scotch stone slate. The ceiling is to be curved or barrel-shaped, and the roof of the chancel will also be curved, but divided into panels with bosses at the intersection of the ribs. The chancel will be floored with chequered red and white stone, and the walls plastered. The cost of the building will be about £2,000. The architects are Messrs. Freeman & Ogilvy, Staple Inn, London, and the contractors as follows: Masons—Messrs. John Gray & Son, Newtyle; joiners and carpenters—Messrs. A. Bruce & Son, Clepington Road, Dundee; plumbers—Messrs. James Fyffe & Son, Nethergate, Dundee.

King Alfred an Architect.—A chaplet has been hung on the wall of the Free Reference Library, Manchester, below the statue of King Alfred. The chaplet has been sent by the Manchester Society of Architects, and the "raison d'etre" was thus explained by Mr. A. Darbyshire, the President of the Society: "It is not generally known, perhaps, that King Alfred was an architect. William of Malmsbury, in his 'Chronicles,' speaks of him as 'not only a lawyer, ruler, mathematician and poet, but also a complete architect.' Of course we know that he rebuilt London, and also really built the towns of Winchester and Dorchester. He was, in fact, a real architect as well as a great many other things. It struck me, as President of the Manchester Society of Architects, that it would be a nice thing to honour his memory, and the Society has sent the chaplet, which is made of laurels to indicate his victorious character, and white flowers to indicate his high morality. The Society decided that the chaplet should be accompanied by the statement that it was from the President of the Manchester Society of Architects as a token of high respect for the memory of the great monarch, who was the pioneer of English architecture."

New Patents.

These patents are open to opposition until October 28th.

1901.—Ceiling Supports.—11,423. J. Erath, 24, Molsheimerstrasse, Strassburg, Germany. Holders of H-section with a serrated spike are driven into the beams and between them plaster slabs are fixed. Sound is thus deadened, the plaster does not crack, and there is an air-space above the ceiling.

Artificial Wood.—13,136. E. Helbing, 5, Schillerstrasse, Wandsbek, Hamburg. Peat is thoroughly washed and is mixed with hydrate of lime and sulphate of alumina. The mass is pressed in a wet condition and dries hard in the open air.

Parquet Floor Blocks.—13,818. E. Wuhrmann, 18, Kinklestrasse, Zurich, Switzerland. This invention relates to a machine which nails the floor blocks together into squares; thus, three blocks are nailed together side by side and another three are nailed to them. The machine has synchronously-working hammers in front of which are holders for the nails, while the blocks are fed down an incline.

The following specifications were published on Saturday last, and are open to opposition until November 4th. The names in italics are those of communicators of inventions. A summary of the more important of them will be given next week.

1900.—15,781, Defries & Feeny, sewage waggons. 16,780, Howell, high-pressure accumulator for incandescent gas lighting. 16,962, Moffatt, automatic doors for closing the entrances to lifts. 16,978, Tenow & Flodström, apparatus for the conveying and piling of timber. 17,058, Bell (*Gay & Argue*), chimneys and stove pipes. 17,129, Margetts, hinge joints. 17,428, Armstong, beams or girders. 18,183, Disselkoen, means for cutting glass. 18,232, Davey, domestic and other water-heating apparatus. 18,360, Evans (*Sarpy*), scaffolding. 18,374, Wise (*Salubratapeten Fabrik Basel*), wall coverings. 19,420, Cooke, water-closets. 19,816, Rutty & Bowden, road scarifiers. 20,067, Balmforth & Brown, manhole and handhole doors. 20,130, Clemetson, parquetry. 20,369, de Thiersant & Coulson, acetylene gas generators. 21,123, Flood, channels for sink waste. 21,402, Coveney, Venetian blinds. 21,412, Lane, screws for handrailing.

1901.—6608, Storer, mortising machines. 7,242, Ramage, oils for paints and varnishes. 7,388, Hahn & Lenz, deodorizing and clarifying sewage and effluents from breweries and technical establishments. 9,557, Brucksch, safety apparatus for lifts. 11,715, Lorenc, masonry work. 11,898, Brookes (*Fiske*), brick kilns. 12,073, Sborowitz, imitation marble. 12,626, Joseph K. Sierer, tile floors, walls, &c. 13,696, Lipffert, smoke-consuming furnaces and fire-places. 14,100 & 14,183, Taylor, gas producers. 14,217, Hosking, fanlights, windows, &c. 14,498, Newton (*New Jersey Wire Cloth Co.*), centering supports and fireproof constructions. 14,942, Richards, wall-tie or bond. 15,074, Brooks, windows. 15,121, Barbour, hoisting apparatus. 15,316, Allison (*Lawrence & McConick*), preserving wood. 15,423, Hibbard, safe or vault hinges and door-opening apparatus. 15,432, Hovver & Mason, excavating apparatus.

DRAWN BY E. STANLEY MITTON

Keystones.

A Granite Cross 60ft. high has been erected on the summit of Monte Capreo, near Carpineto, the birthplace of Pope Leo XIII.

A New Presbyterian Church at Wepre is being erected from designs by Mr. A. W. Smith, architect, of Manchester, at cost of £3,200, inclusive of land. It will accommodate 414 persons.

Mr. James Basford, a Leicester architect, while engaged last week inspecting the erection of the new Trinity Hospital for old people, missed his footing and fell head foremost through some girders, sustaining terrible injuries to his head and spine. Assistance was promptly rendered but he died in an hour without regaining consciousness.

A New Theatre at Glasgow is proposed to be erected. The site said to be selected is at the south-west corner of Elmbank Street and Bath Street, at present used as a yard for the storage of building material. The position is an admirable one, being only a few yards off Sauchiehall Street, near Charing Cross. It is stated that the theatre is to be ready for occupation about the autumn of next year, and that the cost will be between £30,000 and £40,000.

King Humbert's Coat of Mail.—Queen Margaret is to preserve in a strong box the vest which King Humbert was wearing at the time of his assassination. This box is of the Renaissance style, made of ebony, with designs in bas-reliefs and in chiselled silver. The front is decorated with the arms of Savoy; on the top is the cross of Savoy encircled with a garland of flowers, while on the other parts of the box are various inscriptions.

The Owen Jones Prizes.—The Society of Arts announces that the next award of the Owen Jones prizes will be made in 1902. These are for "students of the School of Art who, in annual competition, produce the best designs for household furniture, carpets, wall-papers and hangings, damasks, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes, six in number, consist of the society's bronze medal and a copy of Owen Jones's "Principles of Design." Further particulars can be had upon application to the secretary at the rooms in John Street.

The Shoreditch Town Hall is being extended. The existing building is in Old Street, E.C., and has a dignified frontage with a tower of fine proportions, and it has been found possible to utilise the present hall with good effect. The London County Council possessed next door a fire station, which they have had to quit because of insufficient accommodation, and the Shoreditch Borough Council bought the site on advantageous terms. Mr. William G. Hunt, the architect, has designed an extension in strict accord with the hall as it now is. The hall is used for many purposes besides mere municipal business, and these will be served when the additions are completed in a fashion hitherto impossible. The cost will amount to over £20,000. The site has been obtained at a price of only 22s. 6d. per ft., while land round about had been sold at 30s. per ft.

An Addition to Trafalgar Square.—The Canadian Pacific Railway Company have decided to remove their offices from King William Street to a more central situation further west. They have purchased the freehold of a large block of land on the south side of Trafalgar Square, facing the National Gallery across the square. This block is now occupied by three-storey buildings, of which the street frontage is used as shops. The new premises are to be ready for occupation by January 1st, 1903. The new structure will add an imposing feature to Trafalgar Square, in keeping with the premises of the Union Bank of London and the Sun Life Office, which will flank it on either side. A feature of the building is in the top storey, the windows of which are so arranged that at nights a panorama of Canadian views can be exhibited, visible from every part of Trafalgar Square, and on important occasions special Canadian news as cabled from Montreal may be displayed in the same way.

A New Parish Church at Skirkieran, Bira, King's Co., Ireland is being erected.

Bartholdi the sculptor is an Alsatian, and several of his best works have been erected in his native province. His latest achievement is a huge figure of an Alsatian Cooper holding a glass in one hand and a bottle of Rhine wine in the other. The *tonnelier* will be placed on the top of the Wine Exchange at Colmar, in Alsace.

M. Uphues, the Berlin sculptor who executed the bust of the late Emperor Frederic which now stands in the park at Homburg, has been commissioned to produce a corresponding portrait in marble of the late Empress. This—the first monument to her Majesty's memory—will, when finished, be erected face to face with the bust of the late Emperor.

A New Public Library at Grangetown, Cardiff, has been opened. The cost of the buildings and freehold site was £3,501. The library is situated on the junction of Clive Street and Redlaver Street. The architect was Mr. E. M. Bruce-Vaughan, whose design won an open competition. The building is of red bricks with stone facings. It is well-lighted and ventilated. The contractors were Messrs. D. Thomas & Son, and Mr. Tom Taylor was clerk of the works.

A New Board School at Darlington is being erected on the left side of Hammer Street, going from Whessoe Lane. This will replace the Jane Street school and the old school near the Rolling Mills. The premises will be plain. Accommodation is to be provided for 420 scholars in the mixed departments and 270 in the infant school. The schools will cost about £8,500, apart from the price of the land. Mr. G. G. Hoskins is the architect, and Mr. H. St. P. Armstrong clerk of works. Messrs. John Guthrie & Son are the contractors for the brickwork; Messrs. T. Stairmand & Son for the woodwork.

The Memorial to the Late General Sir William Penn-Symons at Saltash was unveiled last week. It is from the design of Mr. A. S. Parker, of Plymouth. Mr. Bolt, of the Merrivale and Gunnislake quarries, undertook the erection, but he died before the work had far proceeded. His sons agreed to carry on the task and commissioned Messrs. Wakeham, of Plymouth, to complete it. The monument, which embraces a shaft arising out of a substantial plinth and capped by a carved crown, heavily gilded with English gilt, stands about 30ft. high. At the base is a bronze medallion (on the obverse side) with a life-sized bust of the late general, designed by Mr. A. Drury, A.R.A., and cast by Messrs. Singer, of Frome. The last-named firm have also made a bronze tablet, which will be placed beneath the medallion, bearing an inscription. The memorial has been erected in the centre of the Victoria Gardens.

Liverpool Cathedral: The St. James's Mount Site Adopted.—The executive committee who have in hand the carrying-out of the project to build a cathedral at Liverpool have adopted the St. James's Mount site and negotiations will be entered into with the corporation for the acquisition of the necessary land. In his report on this site Mr. George Bradbury, surveyor to the diocese, says: "On looking through the designs submitted in the Liverpool Cathedral Competition in 1885 I find that a basement storey is indicated below the level of the nave and chancel; this has a height of about 20ft. If we assume that a similar plan is adopted and the level of the nave floor of the new cathedral is placed upon the present level of St. James's Mount, then I have little doubt that the original rock will be found at about the level of St. James's Road, in some places about 10ft. above that level; and therefore some rock would have to be excavated to make such a basement. If it is decided not to construct a basement storey then I think the rock will be found, on an average, at about 12ft. below St. James's Mount, or an average of about 8ft. above St. James's Road. If any of the cathedral walls approach close to the cemetery wall, then in some places foundation might have to be carried down a depth of 40ft. from St. James's Mount. There is ample space on the northern portion of the Mount for the erection of the proposed cathedral. The foundations will present no exceptional difficulties, and their cost will compare favourably with other suggested sites."

A Memorial Window to the late Captain C. J. K. Maguire, of the Royal Sussex Regiment, has been placed in Bangor Parish Church.

Falguière, the distinguished sculptor, left unfinished several important works, among them being statues of Balzac and Pasteur. Under the direction of Paul Dubois, of the Beaux-Arts, the statues are being completed, and will be placed, Pasteur in the Square Cluny and Balzac in front of the Conseil d'Etat.

The Ancient Parish Church at Wingrave, Buckinghamshire, has been thoroughly restored at an expenditure of nearly £6,000. The tower has been restored at the base and the structure has been raised by 5yds. to provide for an adequate ringing chamber and a clock chamber, and an entirely new turret has been built.

A Memorial to the late Lord Caledon has been unveiled in the parish church at Caledon. The memorial, which is a beautiful piece of carving in stone, extends right across the entire base of the chancel window and is supported at either end by a single Corinthian column of marble and by two triple columns of marble in the centre.

Lewisham High Road Congregational Church, New Cross, London, S.E., has been renovated and decorated throughout, and the electric light installed. The stonework of the spire has been re-pointed in cement, and treated with a solution of "Fluate," and a new lightning conductor fixed by Messrs. E. Beresford & Co., Ludgate Circus, E.C. The repairs and decoration have been carried out by Messrs. J. O. Collingwood & Co., Brockley, S.E. The electric light was installed by Messrs. Braby & Tomlinson, 18, Hart Street, Bloomsbury. The electric fittings were made by Messrs. Evered & Co., of Drury Lane, W.C. The whole have been carried out from the designs and under the superintendence of Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, architects, of 5, Clements Inn, Strand, W.C., at a total cost of about £1,300.

Amesbury Church, well-known to visitors to Salisbury and Stonehenge, is proposed to be restored. The building is of ancient date, and portions of it are thought to have belonged to the Abbey Church, built in the twelfth century, on the site of the Benedictine convent founded by Queen Elfrida in the tenth century. Much havoc was wrought by an unfortunate "restoration" in 1852, but the present work is one of renovation and repair, mainly intended to save the old Norman central tower from destruction. The tower is supported on four wide lofty pointed arches, and now shows fractures of a dangerous character. Experts say that the four angles of the tower have become separated, while the voussoirs of the arch are nipped, the fractures being caused partly by inadequate foundation for the weight of the tower. It is necessary that measures should be taken by underpinning and other measures which would in nowise affect the appearance of the sacred edifice. Other matters requiring attention are the bulging choir walls and the dampness of the nave walls. It is estimated that £1,400 will be needed for these structural repairs.

New Central Co-operative Stores at Normanton, are being erected in Westgate for the Wakefield Industrial Society, Ltd., from the competitive designs of Mr. A. Hart, of Wakefield. They will cost, exclusive of furnishing, from £23,000 to £24,000. On the first floor there will be a suite of business offices and a strong room, rooms for recreation, committee meetings and the meetings of the Women's Guild; while on the second floor there is to be an assembly and concert hall, 100ft. long by about 50ft. wide, with a platform at one end and a gallery at the other. There will also be a smaller hall about 40ft. square which will be useful for smaller meetings, and each will be amply provided with ante-rooms, cloak-rooms, &c. The style of architecture is an adaptation of Flemish and Gothic. The principal contractors are Messrs. Clegg & Son, Morley, brick and stone work; Messrs. Pickles Bros., Leeds, slating; Mr. Marsden, Knottingley, plastering; Mr. J. Loyd, Wakefield, carpentry and joinery; Mr. George Blakey, Wakefield the shop fronts; Messrs. Bagshaw & Sons, Batley, iron and steel work; Mr. S. Atkinson, Wakefield, plumbing and glazing; and Mr. G. Parker, Wakefield, painting.

Mr. Glendinning Moxham, architect to the Swansea General and Eye Hospital, has received instructions to prepare plans for a convalescent home to be erected at Swansea.

Crematorium for London.—A site for another crematorium for London has been secured at Golder's Green, Hendon, adjacent to the terminus of the proposed tube railway from Charing Cross to Hampstead. Extensive excavations and building operations have already commenced.

New Fish-Curing Works at Dundee are being erected at Carolina Port, in the immediate vicinity of the Fish Dock. The plans of the buildings have been prepared by Mr. William Alexander, city architect. The buildings will be two storeys in height. The contractors for the work are: Brickwork, Mr. John Carnegie; joiner work, Messrs. Garvie & Farquharson; slater work, Mr. David Hutchison; plumber work, Mr. Colin White; concrete work, John Adam & Son.

A New Manchester Hospital.—A Local Government Board enquiry was held recently at Manchester into an application of the Lancashire County Council, to borrow £16,000 to erect an infectious disease hospital at Fall Birch, Chorley New Road, Horwich, for the Urban Districts of Blackrod, Horwich and West Houghton. Accommodation will be provided for forty beds and administrative block, the cost being £400 per bed. There was no opposition.

An American Hotel for London.—London is to have a new hotel built and managed on the most approved American principles and financed by an American syndicate. In order that a suitable site may be provided for it the Walsingham House and the Bath Hotels in Piccadilly are to be demolished forthwith, and the new building is expected to be ready in less than two years. It is to be built of stone and will rise to the height of eight storeys containing 350 rooms. The restaurant attached to it will run the whole length of the building on the park side and be fronted by a private garden.

A Baptist Church is to be erected at once in Lewin Road, S.W., and the tender of Messrs. W. Johnson & Co., Wandsworth, has just been accepted for the work at £3,033. A bold, square tower and spire above forms a prominent feature of the design and front elevation. The building is faced with red bricks and the dressings are of white Costessey stone. The roof is to be covered with green slates. The architects whose design was selected in a competition held some years ago, are Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, of 5, Clements Inn, Strand, W.C.

How to Preserve Tapestries.—M. Jules Guiffrey, administrator of the Gobelins Factory, gives the following valuable particulars as to the means of preserving tapestries. They must not be fixed to the wall with nails, but suspended by rings sewn in the upper part. They should be isolated from the wall by a wood frame, and should never be left shut up in a drawer or closet without being protected by vermifuge. They must be beaten, brushed and exposed to the sun now and again, and must be rolled, not folded. If it is necessary to wash them thoroughly they should be plunged in running water for twenty-four hours and rubbed lightly with soap. This means of cleaning tapestry must not be overdone, as the colours, though they have wonderful resisting power, might be damaged.

Technical Classes in Camberwell.—The Technical and Art Classes held at the Greencoat School, Camberwell Green, S.E., resumed work for the winter session last Monday. These classes, in affiliation with the Technical Education Board of the L.C.C., the City and Guilds Institute and the Board of Education, have for many years done good work among the artizan population of Camberwell. Of late their usefulness has been considerably increased by the help of the Technical Education Board's grants in aid of equipment. By this means a very valuable collection of models and apparatus has been provided for the use of students employed in the building trade. In the past session six of the students were awarded exhibitions in science and technology as a result of a competitive examinative held in April last by the Technical Education Board of the London County Council.

Views & Reviews.

Machine Design.

Professor W. Cawthorne Unwin's "Elements of Machine Design" is now the recognised standard text-book upon the subject. When it first appeared thirty years ago there were not so many aids to the study of the application of scientific principles to all branches of engineering practice as now, and the large amount of experience was not then available; so that the task of writing the book was a most arduous one. Its success, however, can be judged from the fact that it has now reached its eighteenth edition. From time to time the book has been revised and enlarged, about one hundred pages having been added to this new issue. It has grown up with the advance in machine design and no useful departure has been omitted: yet the book has not become a large one. This most advantageous quality has been obtained by systematic digestion until every line in the book is replete with facts. The treatise fulfils its purpose of standing between works on applied mechanics and empirical books of rules and collections of examples of machine details. In common with the former, a summary of scientific rules applicable to the design of machines is given, and to some extent standard proportions and examples of details are included, and also empirical rules for cases which cannot be treated scientifically. A great part of the book deals with the region which lies between applied mechanics and rule-of-thumb methods, and this discussion of the various considerations which should be present in the mind of the designer of machines in applying scientific principles on the one hand, and which limit the reliance on purely practical experience on the other, forms perhaps the most useful portion of the book. It is here that machine design, as other branches of engineering, approximate to architectural design, the same balance between theory and rule-of-thumb obtaining in the one as in the other. Professor Unwin of course recognises that the correct teaching of the student is to give him a knowledge of the principles and train his mind to think elastically and deeply, so that he may apply the process of criticism to the problems as they present themselves. The following, with slight alterations, might be applied to the architect: "At every step the designer has to stop and weigh various considerations, the estimate of loads, the factor of safety, the limiting stress, the allowance for friction and wear, and many others. It is the multiplicity of these which render all practical problems in a sense indefinite, and from a purely scientific standpoint insoluble. But the recognition of them and the power of according to them their due relative importance in different circumstances is the distinction of the competent designer of machines." As the work deals with a branch of constructive design, though restricted to metallic materials, it is of interest and use to architect and engineer alike, and the chapters on materials, straining actions, strength of materials, riveted joints, bolts, nuts, keys and cotters form the best summary of applied mechanics and practical methods in iron and steel construction which we have seen. The book, in fact, has been used extensively by engineers as a handy reference book in designing girders, cantilevers and other metalwork, wooden beams, &c., and bridges, workshops, and in other branches of construction in the domain of architecture. It is to be hoped that the materials and forms of construction used by architects will be analysed and investigated in the near future as fully as iron and steel have been, and the practice of building put upon as good a basis as engineering workshop practice for the avoidance of the loss of information obtained by the practical experience of the men engaged in every branch of the trade. Further, we wish to see a book of building construction modelled on similar lines to Unwin's "Machine Design." The first part of the book dealing with general principles, fastenings and transmissive machinery is only as yet published in this new edition, but the second part, dealing chiefly with engine details, will appear shortly.

"The Elements of Machine Design: Part I., General Principles, Fastenings and Transmissive Machinery," by W. Cawthorne Unwin, F.R.S., B.Sc., M.I.C.E., &c. Price 7s. 6d. London: Longmans, Green & Co., 39, Paternoster Row, E.C.

The Art of Road-Making.

This is the sixth edition, revised, of this book, with additional chapters by A. J. Wallis Tayler, C.E., who is probably better known as the author of "Refrigerating and Ice-making Machinery" than as an authority on the subject of the work under review. The present edition is enlarged by about 120 pages, and the price is increased to 6s. The new matter consists principally of chapters on hard and preserved wood pavements, brick pavements and footways. To the appendix is also added a short supplementary historical sketch on the steam-roller, with a table of the cost of steam road-rolling, and bylaws made in 1857 as to the formation of new streets in the Metropolis. The earlier portion of the work, consisting of a "Historical Sketch" by D. K. Clark, and Part I. on the principles of the "Construction of Roads" by Henry Law, remains as in the former edition with little or no revision. Part II. deals with "Modern Practice in the Construction of Roads and Streets," and treats in detail of the various materials used in road and footway construction, including macadam and pitched roadways, stone, wood, asphalt and brick pavements, together with chapters on the comparative cost and wear of the different forms of construction, and on the resistance to traction encountered on common roads. Chapter XII., on "Wood Pavements," has been brought closer to date by the addition of useful information on the methods of laying and jointing wood blocks and on the principal woods employed at the present time, with special reference to the various classes of Australian hardwoods, such as blackbutt, blue gum, jarrah, karri and others. Figs. 57 and 58 are longitudinal and transverse sections of wood pavement showing joint with lath and stud distance pieces respectively between the blocks. The author rightly points out that the simpler the joint the better. The views as to level and contour of wood carriageways, the inclinations of channels and the foundations for wood-paving are largely those of Mr. G. H. Stayton* and give sound practical advice. In a useful chapter on "Hard-wood Pavements" the author recommends *close* jointing of the blocks, and as to the general mode of laying quotes liberally from a paper read before the Institution of Civil Engineers by Mr. Alexander Smith, M.I.C.E., on work of this class laid down by the Government in Sydney, and gives particulars of experience gained in London on hardwood pavements by several of the Metropolitan surveyors. Twenty years' observation of the London streets has, unfortunately, convinced the author "that less and less attention is being devoted to their cleansing, although the taxes have almost everywhere risen considerably." A new chapter is introduced on "Brick Pavements," and the merits of different classes of brick are well described. "Footpaths and crossings" are fully dealt with in Chapter XIII., and almost every class of material for paving, curbing and channelling is described. Reference is made to the growing use of artificial paving slabs, and the method of their manufacture is described. One unsatisfactory feature of the book is that so many of the tables of cost of maintenance of various road-surfaces and other tabular matter are of very old date, and of little practical use at the present day owing to the varying prices of labour and materials. For example, we have on p. 153 the cost per sq. yd. of repairing Piccadilly macadam roadway in 1834, and on p. 172 the cost of the reparation of carriageway pavements in the city *up to* the year 1840. Very many other instances may be mentioned; and although they occur in Part II. of the book they certainly cannot be considered "*recent* practice," but should be relegated to the historical section and new up-to-date tables and data supplied to take their places.

DOMESTIC HOT-WATER SUPPLY.

MR. FREDERICK MILAN recently lectured at the Huddersfield Builders' Exchange on "Domestic Hot-water Supply." By the aid of diagrams he showed what is described as the two-cistern system, said to be an improvement on the "L" boiler, as water could be obtained at any level under the cistern and reserve ; but it was open to great objection. Should the ball tap or supply fail, the store could be completely exhausted by drawing at the low-level tap, thus leaving only the boiler. With a good fire this would mean either serious damage or destruction to the boiler. The cylinder arrangement was a great improvement, but it was liable to derangement from several causes, such as stopping of the expansion or air pipe by frost, and the air pipe becoming choked by the formation of an ice plug, which hermetically sealed it at the water-level. Another objection to this system was that the cylinder being placed so far away from the boiler, sometimes with the object of heating the bath- or linen-room, a large length of circulation pipes had to be fixed, and the water in the pipes was liable to freeze. A further objection was that it was only single circulation. Mr. Milan showed the advantage of the cylinder system with a double circulation, which he acknowledged was the most perfect at present known and could be adapted in various ways to suit any class of building. Hot water could be obtained immediately the tap was turned, the cylinder supply could not be exhausted by drawing, and the whole of the water in the apparatus was in constant circulation. It was erroneous to think that kitchen boilers exploded because they were short of water, the sudden inrush of cold water causing a burst, and he stated that no explosion would occur providing the outlets were open. By means of a small apparatus constructed for the purpose Mr. Milan illustrated his remarks.

The chairman (Councillor J. Berry), commenting on the remarks made, expressed the opinion that it was a mistake to erect cisterns in the false roofs, as they not only froze there, but were inconvenient to get at when it was necessary to examine the fittings. With regard to the fixing of cylinders in the bathroom, they were not always able to persuade their clients to have them fixed in the kitchen owing to the heat they threw into the room.

GLASGOW'S NEW GENERAL HOSPITAL.

THE memorial-stone of the new General Hospital, which is being erected at Stobhill by the Glasgow Parish Council, was laid last week. The hospital covers fifty-two acres, will provide accommodation for 1,500 patients and 150 nurses and other members of the staff, and its estimated cost is £200,000. An admirable site, 350ft. above the sea level, has been secured on the lands of Stobhill, a short distance north-east of Springburn Public Park. The buildings are pleasantly situated and command a fine view of the Campsie and Blane valleys. They will be constructed of red sandstone and bricks, and will be perfectly equipped. The receiving block, the official block and doctor's house are placed at the main entrance, and are reached immediately on entering the gates; while the administrative block, consisting of general stores, kitchen, &c., is placed in the centre, so as to be easily reached from all parts of the building. This position, in addition to being central, presents another very decided advantage, as one side of it comes forward near to the low hollow of the ditch, a railway siding being brought in here so that goods will be discharged direct from the waggons into cellars below general stores, which they reach by means of an electric hoist. The laundry is also placed on this siding, so that the coal can be discharged from the waggons direct into the stoke-hole, thereby saving a very large sum annually for cartage. The disinfector and store for patients' clothes are placed near the laundry. An isolation ward is provided for suspicious cases; this is placed in an isolated position to the north of general hospital. The wards for children and the aged and infirm are placed on the west side of the site, and connected with general stores and kitchen by a central avenue. The nurses' home and doctor's house are also on this side. On the upper floor the accommodation is as follows :—Dining-room, drawing-room, bedrooms for three assistant medical officers, one spare bedroom, linen-room, and the necessary bath and lavatories, also service-room and housemaid's sink. The admission block is one storey in height, and consists of entrance hall, and on each side (one for the males, the other for the female sex) there are waiting-rooms, examination-rooms, bath-rooms and bedrooms. The whole of the wards are arranged so as to run north and south, in this way getting the maximum amount of sunlight. The isolation block is divided into four wards of four beds, thus allowing for two different diseases for each sex ; the cubical contents and also the arrangements being made in strict accordance with the requirements for fever and smallpox hospitals. There is also sleeping accommodation for the nurses, kitchen, and every requisite, thus making the block complete in itself, so that it can be kept perfectly isolated from the main hospital. The buildings are from the designs of Messrs. Thompson & Sandilands, of West George Street.

ST. HELEN'S CHURCH, WADDINGTON.

ST. HELEN'S CHURCH, Waddington, has recently been restored and re-decorated at a cost of £3,500. With the exception of the tower, which probably dates from the middle of the fifteenth century, the church has in the main been entirely re-built, the only old portion retained being the eastern responds of the arcade, which give the line of the old nave and the east window and wall of the south aisle in Garnett Chapel. The east window has been repaired and re-fixed, also the west window of the south aisle and the window of the north in Parker Chapel, which has had a tracery head added. The walls inside the tower have been pointed, the doorway and window repaired, the parapets reset and new pinnacles added. The new church is designed in keeping with the old work in the Early Perpendicular style and consists of a nave of four bays with north and south aisles, south porch, chancel, with Parker Chapel on the north and Garnett chapel on the south, with organ transept and choir and clergy vestries to the north of Parker Chapel. A special feature of the church is the continuous arcade without a chancel arch, which is peculiar to the Craven churches. The division of the nave and chancel is marked by a special principal with drop rafters and shafts and carved curves, the chancel roof being also kept somewhat lower than the nave. The nave is lighted by three-light clearstory windows, and the aisles, which have battlemented parapets, by three- and four-light windows. The roofs are of oak covered with flag slates. The passages are flagged and the seat blocks paved with oak wood blocks laid in asphalt on concrete. The chancel floor is paved in pattern with blue and yellow flag and Sicilian white marble. The old choir stalls and Parker Chapel seats have been re-fixed and the nave is seated with chairs, simple oak seats and font being fixed in the nave. On the north side of the chancel an old doorway was discovered under the plaster, built up. This has been opened out into the Parker Chapel. Here an oak screen across the Parker Chapel has has been remodelled and fixed, as much of the old work as was suitable being used. The old stained glass has been repaired and re-fixed by Messrs. Shrigley & Hunt of Lancaster. The heating is on the low-pressure system by hot water. The west window has been given by Mr. Waddington of London. The work has been carried out by Messrs. Veevers & Sons of Clitheroe, with the following sub-contractors: Mason, Mr. J. Bleazard ; slater, Mr. J. Robinson ; plumber, glaziers and heating, Messrs. Watson & Sons ; all of Clitheroe, under the supervision of the architects, Messrs. Austin & Paley of Lancaster.

Mr. James Reid, of Glasgow, has been appointed Clerk of Works in connection with the erection of the new Market Hall for Leeds. The Market Hall, which will be built from plans prepared by Messrs. Leeming and Leeming, architects, will cost about £100,000.

DRURY LANE THEATRE.

THE interior of the Theatre Royal, Drury Lane, has within the past few months been undergoing a great change, and is almost out of the hands of the contractors. The first thing observable in the new arrangement is the improvement in the auditorium—by bringing forward both the grand and the first circle by a largely increased sweep. The large and cumbrous boxes that formerly occupied so much space on the ground floor have been entirely dispensed with, and a better line of sight ensured from the pit and the stalls. The latter were formerly not the most comfortable in London, and access to some parts of them was both difficult and inconvenient. Now not only are the stalls accessible from either end, but two large alleys have been constructed down to the right and left of the centre line, and the stalls arranged in a gentle curve, so that those who are seated at the ends have not to twist their heads to secure a view of the stage. The old and ugly pit barrier has been removed, and is replaced by a brass rail and light curtain. The stall seats themselves are upholstered in Russian leather, which is cleaner and cooler than the material usually employed. The theatre has been entirely re-decorated, the scheme being white and gold. The boxes are draped in amber, and the passages decorated in white and amber, which renders them light, airy and cool. A warm reddish paper completes the background in the auditorium, and the stalls are carpeted in deep red plush. Draughts, it is hoped, will not be perceptible in the future. An elaborate system has been introduced whereby hot and cold air can be pumped into the theatre when necessary. The orchestra has been partially sunk, so that the heads of the players will no longer obtrude between the audience and the stage. In order that no inconvenience may be experienced by the sudden extinction of light, two complete and entirely separate systems of electricity have been installed. Needless to say that the re-arrangement of Drury Lane Theatre affords greater seating capacity than heretofore.

Surveying and Sanitary Notes.

A New Level Drive from Eastbourne to Willingdon is to be constructed by Messrs. W. L. Wallis & Co., whose tender is for £3,592, inclusive of roads through The Decoy.

"Deadened" Red-Gum, which has recently come into prominence in regard to the Westminster paving scandal, derives its name from the method of seasoning the wood. To "deaden" wood is to season it before the tree is felled. This is effected by the process known as "ring-barking." A ring is chipped with an axe into and round the tree through the bark a few feet from the ground during the winter months. When the spring comes the sap does not rise again and the tree dies. Red-gum blocks from trees that have been deadened in this way for eighteen months before they were felled are what are said to have been called for by the Westminster Council's specification.

The View from Richmond Hill.—Some anxiety has been occasioned in connection with the prospect of saving the view from Richmond Hill by the action just taken by the Twickenham District Council, whose assistance in the purchase of Marble Hill and the adjoining land required will be a material factor in the scheme. The council has just resolved to purchase Radnor House and grounds, which front on the Thames some distance above Eel Pie Island, quite round the bend of the river and out of the view, together with the small island lying alongside them. There is at present a difference of a few hundred pounds in the prices offered and asked for, but this is not expected to be an obstacle. The estate will be laid out as a recreation ground for the west-end of the parish at a cost of £5,000 or £6,000. The matter is being very hurriedly pushed through ; and it is anticipated by many that when the council are asked to contribute to the other scheme they will excuse themselves from doing much on the ground of the heavy expense incurred at Radnor House, thus leaving it to outside effort mainly to find an open space for East Twickenham

Bricks and Mortar.

APHORISM FOR THE WEEK.

Architecture exhibits the greatest difference from nature which may exist in works of art; it involves all the powers of design, and is sculpture and painting inclusively. It shows the greatness of man, and should at the same time teach him humility.—COLERIDGE.

Our Plates. THE Cresswell Infants' School has been carried out for his Grace the Duke of Portland and the Bolsover Colliery and consists of converting the old schoolroom into a central hall and adding a bay window and other details; also in providing new classrooms, &c., to accommodate 240 children, cloak-rooms and other necessary accommodation. The old Mistress's Cottage has only been very slightly altered. The old school was erected with the local stone, and the additions have been carried out in brick with local stone dressings, the roof being covered with green slates; the windows have iron casements and lead lights. The drawing is by Mr. T. Geoffry Lucas.—The church of St. John the Baptist, South Witham, is one of the most interesting of Lincolnshire churches, containing Gothic architecture of the following periods, Norman, Early English, Decorated, and Perpendicular; it has nave, north and south aisles and transepts. The chancel is entirely cleared away. The plan is somewhat unusual, as both aisles taper from west to east, at the west end being 7ft. 6in. wide, and tapering to 5ft. at the east end. The north arcade consists of three bays, supported by beautiful circular Norman shafts, from which spring semi-circular arches. The south arcade consists of three bays, having Early English octagonal shafts and richly-moulded caps with pointed arches. The western respond to this arcade is Early English, with a finely moulded cap with nail head enrichment. The eastern respond is octagonal with a beautiful foliated cap. The west end is Early English and has on the exterior three plain buttresses, the gable being surmounted with an open bell turret containing two bells. The south transept is Decorated and the north transept is Perpendicular, the windows in each being very fine. The restoration consists of a new chancel, vestry, and organ chamber; also entirely restoring and re-roofing the nave, aisles and transepts with oak, and the whole will be covered with Colly-Western stone slates. The old high pews are taken away and the church will be repaved with stone and wood blocks and will be reseated with chairs. A cement channel will be formed round the whole of the church and the exterior stonework, &c., will be carefully restored. The drawing is by Mr. C. E. Mallows.

The Statue of Peterborough Patron Saint. THERE is a statue of St. Peter (to whom Peter's borough—the modern city of Peterborough—was dedicated early in the thirteenth century, immediately after the Prince of the Apostles had been elevated to the chief place of honour, high up and nearly out of sight, on the great Façade of the minster, then a Benedictine Abbey) which has just been photographed for the first time from the scaffold erected by the contractors to the Restoration Committee, Messrs. John Thompson. It is situated on the topmost part of the magnificent gable of the Cathedral front, under the rich floriated cross which crowns the apex. Some idea of the enormous size of the cross may be had when we say that with the base it is about 7ft. long and 4ft. across the arms, a measurement which roughly tallies with the size of the seated statue of St. Peter himself. It must have been the occasion of a great festival away back in those early years of the thirteenth century when the great cross was erected above the lordly statue of the fisherman with the keys; and when the monastery and the tiny town which had grown around its walls were placed under the special protection and patronage of St. Peter, whose representation, though lost to view in these eeric heights, was to be a perpetual reminder to the world of the distinction thus conferred. Four times previously had the settlement we now know as Peterborough undergone a change in name. It was Medehampstede during the Anglo-Saxon and Anglo-Norman dynasties; afterwards Gildenburgh from its riches or gilded minster; next it bore the name of Burgh, or Burigh, from its fortified walls; and lastly Peterburgh or Borough, the minster and town dedicated to St. Peter. Before the west front proclaimed the completion of the present church (*circa* 1237) two other churches, with their monastic buildings, had been burned to the ground—one by the marauding Danes who slaughtered the whole of the brotherhood and plundered the church, and one burned by accident. From an archælogical point of view the statue is additionally interesting, for if the belief of the late Mr. J. T. Irvine is true that the west front above the main string was hurriedly reduced in design, there is shown here the amazing skill of the master mind, whose ingenuity made up for the statuary being denuded of their canopy arches by incorporating the heads of the niches with the ornamental cusped copings of the gables. The right hand alone is missing from the figure. This hand would originally be raised with its two fingers extended in the act of blessing. The keys of authority, like most other parts of the statue itself, have wonderfully survived the disintegrating agencies of seven centuries' exposure. It is executed in Barnack ragstone, and rests upon a base of Alwalton marble which had crumbled and which has since been renewed. The statue itself will remain untouched. There is no record as to when the hand fell. The beautiful dominating cross has had a fragment of the outer floriation at the extreme top replaced, but beyond this it seems as perfect as when the masons left it.

School of Art, Keswick. THE workers of the School of Art, Keswick, inspired by a lecture delivered to them by Canon Rawnsley, have made and presented to the Mayor and Corporation of Winchester a large silver rose-water dish in commemoration of King Alfred. The dish is of beaten silver and enamel work and bears the inscription, in the letters designed by Albrecht Dürer: "I desire to live worthily all my days, that after death I might leave to my successors a memory of good work done." Canon Rawnsley, who took part in the Millenary Celebration, is himself the designer of this beautiful work of art, and the employees of the School have made it out of their regular working hours. The School of Art at Keswick was founded about thirteen years ago, chiefly through the exertions of Mrs. Rawnsley, who was anxious to give some of the inhabitants who find it difficult to procure work out of the tourist season employment through the winter. The complete success of the undertaking is highly gratifying. The school is now on a perfectly sound, self-paying basis. It inhabits a beautiful creeper-clad building situated in a little garden hard by the Greta Bridge. Much work, chiefly in metal, of a high artistic value is turned out every year and finds a ready market.

The Alfred Millenary Commemoration. THE celebration of the millenary of King Alfred the Great was begun on Wednesday last at Winchester, which city was the ancient capital of his kingdom and here he, the great Wessex king, spent his boyhood and grew to manhood, and held his court after he had broken the power of the Danish invader; and finally was laid to rest at Hyde Abbey in the city. Winchester was famous in Alfred's day for its trade and commerce and for its guild of merchants, the precursors of our own London guilds. On Wednesday morning the visitors first went to the ancient West Gate, which stands at the top of the High Street. Here only Roman remains are to be found. The Castle Hall was then visited, where Mr. W. Portal lectured on its two Norman walls and the reputed table of King Arthur hanging upon one of them. On Thursday the delegates visited Winchester College and Wolvesey, hard by the College. Although Norman remains here again asserted themselves necessarily most conspicuously in the ruins of Henry de Blois' castle, the delegates were also on the grassy site of the old palace of the Saxon kings and nearer to Alfred's dwelling-place in Winchester than they had yet been. Mr. N. C. H. Nisbett, A.R.I.B.A., who was in charge of the delegates here, referred to tesselated pavements discovered underground to times far more remote—those Roman days which were to Alfred in his day nearly as far off to him as his times to us. But here, at all events, was the undoubted site upon which he had gathered round him the learned men of the world he knew. A bit of the irregularly embrasured wall at the far end of the green enclosure had been identified as Saxon work. The old palaces had unquestionably been used in building up what was the new castle in the days of Henry of Blois. Of Saxon work, as usual, there was little or nothing to be said, and only chances for conjecture; but the Norman columns of the palace which was there before this ruin, were shown embedded in it sometimes to strengthen its fortress-like character, sometimes for sheer indifference to their previous uses. The head of a column laid in a horizontal direction served will enough for a door jamb. What cared they in those days when such material was at hand to what altered uses it was put? There was a small diagram in Mr. Nisbett's hand showing by differently tinted lines the ruins as they stood and, as excavation had shown, how the walls ran when complete. Mr. T. W. Shore, of the London and Middlesex Archæological Society, added an apppreciated speech concerning the two Winchesters, the Winchester of the bishops and the Winchester of modern kings. In the Castle Hall Sir John Evans, the president of the Numismatic Society, dealt with the most tangible evidences of King Alfred's reign—his coinage. Sir John Evans, in the preface of his lecture introduced an interesting reference to the Alfred Jewel, about the use of which there has always been speculation. Some had supposed it to be an ornament for Alfred's helmet, but Sir John Evans thinks it more probably was the head of a pointer for pointing out to the reader the line which he had reached in his reading. On Friday Mr. Hamo Thorneycroft's statue of King Alfred was unveiled by Lord Rosebery. The statue is on a lofty pedestal in the Broadway, Winchester, against the splendid background of the terraced hill of St. Giles, and looks towards the ancient West Gate. The sculptor has portrayed the King with a beard, notwithstanding the tradition of the coins referred to by Sir John Evans, for Mr. Thorneycroft does not believe that the moustachios and divided beard agree with the highest ideal face of the Saxon type.

British Sculptors. MR. M. H. SPIELMANN, who has been engaged for some time past in writing a book on "British Sculpture and Sculptors of To-day," has finished his task, and the volume will be published by Messrs. Cassell & Co., Ltd., early in the autumn. He was impelled to the writing of this book by two things: first, the absence of any book dealing with the subject, and, secondly, by the discussion which was raised on the subject of the Queen Victoria Memorial. He had long waited in vain for the appearance of a book on British sculpture, and the discussion about the memorial and the remarks which were publicly made concerning our alleged English incapacity to produce monumental work led him to undertake the task. "The practice of sculpture," said Mr. Alfred Gilbert last year in one of his lectures at the Royal Academy, "exacts more from the individual than any other branch of art, and demands greater sacrifices, seeing that fewer people in the world understand it." Mr. Spielmann's book has been written for the public, and especially for those who, as collectors and memorial committee-men, give commissions for sculpture. Chapters will deal with "The Bane of Committees," "The Patronage of Sculpture," "The Materials for Sculpture," and the delicate question of the relative position of the sculptor and the architect when working together. The introduction will be followed by critical estimates and descriptions of the work of about eighty living sculptors and metal-workers, arranged according to their seniority as exhibitors. Two hundred illustrations will accompany the text, and the book promises to be as useful to the artist and critic as to that section of the public for whom it is primarily intended.

BUILDING CONSTRUCTION.

1. THE thoughtful person engaged in any kind of constructive work must recognise two opposite tendencies, or tendencies which may be stated as opposites, namely (*a*) The feeling that to be most effective one must be a specialist, and (*b*) that to be an effective specialist one must have general knowledge. Building construction is so wide a subject that there is room within it for many special departments, but the exponents of these departments should have a working knowledge of the whole subject. Moreover, circumstances of time and place make what may be called the general practitioner of the science the only man available. The object of these lessons is to develop that knowledge which is the stock in trade of the general practitioner in building construction.

To keep to this design it will be necessary, after assuming a standard of ordinary school knowledge, to frequently refer students to other works for further information in special departments. Students are not told here at the beginning to prepare themselves for the subject by first becoming geologists that they may understand quarries; physicists, to understand temperatures, expansions, contractions, forces; chemists, to know the compositions of cements, pigments, &c.; mathematicians, to investigate quantitatively physical questions, &c.: sanitary, electrical, gas, mechanical and civil engineers. The subject covers all this ground, and knowledge in every department named will be found to be of use; but fortunately these need not be looked upon as a succession of vestibules to the inner sanctuary of building construction.

Drawing is absolutely necessary in connection with the practice of every constructive art where definite instructions have to be given to second or third parties, but it is also necessary to the workman who is doing anything for the first time. The student should have some preliminary knowledge of drawing with instruments, but he may expect that as he proceeds with these lessons his drawing will improve. The sooner he leaves the mere drawing of copies from cards and takes to drawing from notes and dimensions the better.

The value of pressing forward cannot be too strongly impressed on students. By pressing forward is not meant going forward imperfectly understanding what ought to be known. It is a common mistake however, to suppose that iteration is teaching. One may spend much time in multiplying, adding and dividing abstract numbers, and become expert in this way, but expertness, and much besides, results from actual useful work with figures in concrete examples. The student must know the ordinary arithmetic taught in elementary schools, and he should push on and know mensuration. For his elementary drawing he will have some knowledge of curves and solids, and these things should combine themselves and urge him forward to a knowledge of geometry and algebra. The way is long, but let the student not be too easily frightened with names; he may occasionally be surprised to find that, without intending it, his operation may be called "Trigonometrical" or "Conic section," or "Calculus."

Building Construction when it is called "Architecture" is held to be a Fine Art. Looked at from this standpoint, the subject is different. In "Building Construction" we are behind the scenes with the stage carpenters; in "Architecture" we are among the spectators, viewing a result. We may dissect a flower, show the embryo seed vessel, count the stamens and petals, and explain their functions—and these things have a beauty of their own; but apart from this, and from our own knowledge of the functions of its parts, the flower is beautiful. We say God made the flower, in explanation of its beauty. What are the agents? Some earth, some rotted leaf-mould and some shelter from the wind and frost, in addition to the common sunshine and rain. Everything that we have the name of creating should at least have the beauty of honesty and fitness for its duty.

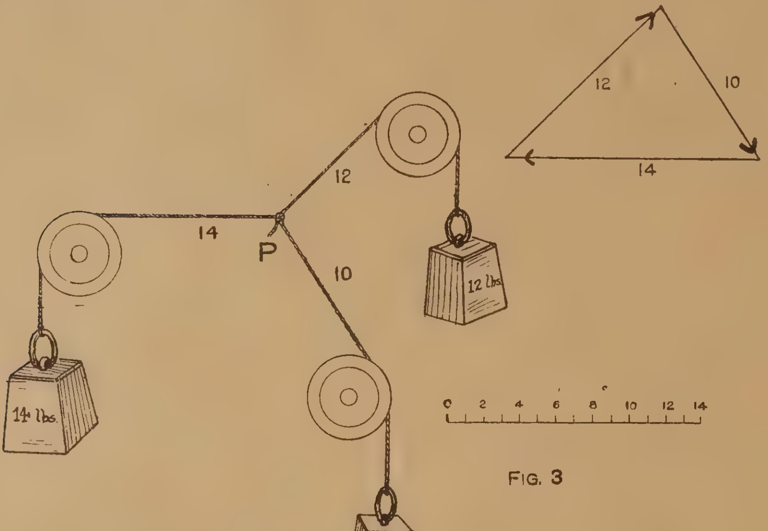

FIG. 3

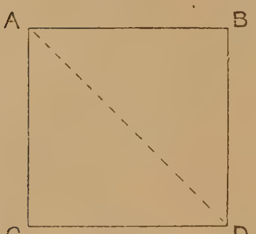

FIG. 1

FIG. 2

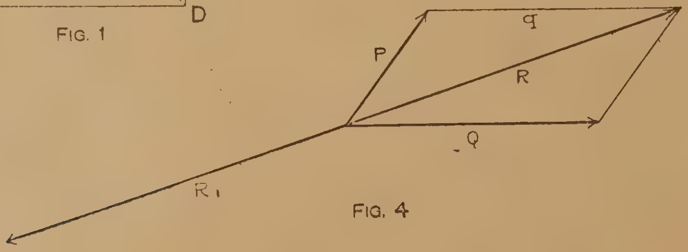

FIG. 4

In several ways we have probably attained the highest pitch of beauty; nothing can ever excel ancient sculpture of the human form, just as the very best has been done in epic poetry; but as for us moderns there are new worlds of fact, so there are new worlds of beauty.

UNITS.—DEFINITIONS, &c.

2. It is practically inconvenient to make the same units of quantity serve for all purposes; just as large quantities of commodities are stated in tons and small quantities in grains, so it will be necessary to vary the units to suit the circumstances. I shall try to make use of such units as are familiar to students, such as are in common use in the building trades in these countries and in America.

Dimensions.—As a rule the unit of dimensions will be the standard foot. I shall refer to the lineal foot, the square foot, and the cubit foot. I may have occasion to use the inch, the square inch, and the cubic inch.

Force.—If a one-pound weight is suspended by a string, there is a tensile stress in the string; this stress varies slightly at different parts of the earth, but it is always the same at the same place, say London; it varies *very* slightly within pretty wide limits of area. If we take a spring balance and graduate it in pounds at London, such a balance will accurately indicate forces in pounds wherever it may be used. The stress produced in a string carrying a one-pound weight at London is the unit of force. If the string with its weight is hung from a nail, the nail is pressed on its upper side with the force of one pound. The same pressure may be produced by pushing the nail downwards from above, using a short piece of stick; in such circumstances, the stick bears a compression stress of one pound.

3. *Force of Gravity.*—The word force is used in a different sense by persons who speak of the *force of gravity.* When a one-pound weight is suspended by a string, the attraction between the mass of the weight and the mass of the earth is balanced by the stress in the string. We can double the stress by doubling the weight and in this way, by adding weights, we can make the force of gravity very great. But *the force of gravity* is spoken of as an invariable thing and it is said to be equal to 32 (roughly). If any weight whatever be allowed to fall freely (for reasonable heights and neglecting the effect of the resistance of the air), it will be found that at the end of the first second it will have a velocity of 32ft. per second; at the end of the second second it will have a velocity of 64ft. per second; and generally at the end of any number n of seconds its velocity will $32n$, and the rate of increase of velocity (*acceleration*) is 32ft. per second per second. It is found convenient to call this acceleration *gravity*—it is inaccurately called the force of gravity, it varies at different places on the earth. It is usual to designate the acceleration by the letter g, and we speak of the g or gravity of the place.

4. *Mass.*—The standard one-pound weight is a definite quantity of matter. The number which expresses the weight of a body as being equal to so many pounds expresses the mass of the body, and the standard pound might properly be taken to be the unit of mass. I have taken the stress produced in a string by the mass of a pound suspended from it at London as a unit of force and I have called it the force of a pound, and I might also speak of the mass of a pound; but for the purposes of formulæ and calculation it is found advisable to have as the unit of mass g lbs., that is, the unit of mass is, roughly, 32 lbs. I adopt these units because they agree most nearly with the ordinary ideas and language of people in practice. (It may be noted that in some books the one-pound weight is taken as the unit of mass and $\frac{1}{g}$ lb., or, say $\frac{1}{32}$ lb., called a poundal, is taken as the unit of force.)

5. *Pressure or Distributed Force.*—If we float a rectangular box in water and load it (1) so that its bottom side is horizontal, the pressure between the water and the bottom of the box is a uniform distributed pressure; (2) if the bottom of the box is not horizontal the pressure is distributed, but not uniformly. We may imagine the area divided into a great many small parts and each part pressed by a small force; the sum of all these forces is equal to the total pressure on the bottom of the box. In the first case the

pressure per unit of area is the total pressure or weight divided by the area of the bottom. In the second case the pressure per unit of area varies; we may speak of an average pressure per unit of area. When we set a dressed block of stone on a bed of mortar the mortar is supposed to uniformly distribute the pressure or weight of the stone and all that rests upon it over the stone on which the bed of mortar rests.

The pressure of water against the sides and bottom of a tank is distributed pressure; so is the pressure of the steam and water in a boiler against the inner surface of the boiler.

A cubicle box—a cubic foot—is filled with water and rests with one face horizontal: the total pressure on the bottom horizontal face is the weight of a cubic foot of water, 62·4 lbs.; this is also the pressure per sq. ft., and the pressure per sq. in. is $\frac{62{\cdot}4}{144}$ lbs. $=$ ·43 lbs.

Consider one of the upright faces represented in cross section by the line A C. The pressure per sq. in. at C is the same as the pressure per sq. in. on the bottom C D. The pressure varies uniformly from that at C $=$ ·43 to the pressure at A which is 0, so that the average pressure $= \frac{{\cdot}43}{2} = {\cdot}215$: the total pressure on the face is $144 \times {\cdot}215 =$ 31·2 lbs: that is, the pressure on each upright face is one half of the pressure on the bottom face.

5. When a weight hangs by a string it is easy to feel that the stress at every part of the string is the same (neglecting the weight of the string), but it is not at all easy to believe that when a strong man overcomes a weaker one, and drags him by a string, the stress or pull is as great at the weak man's end as at the strong man's end, though it is so. The student cannot hope to see this clearly till he understands the effects of forces on masses free to move in the directions of the forces. If instead of two men pulling a string in opposite directions we consider a locomotive dragging a train by a rope: the train exerts no opposite pull—the locomotive does it all—but the rope is manifestly in tension. The question is complicated by considering the friction of the train. Imagine the train to move without friction, then the pull in the rope is producing an acceleration of speed in the train, and if we observe the acceleration and know the mass of the train we can calculate the pull in the rope; *it is equal to the mass multiplied by the acceleration*—in the units which have been adopted. In actual practice it is more than this by the amount of friction (we have assumed our train as being on a *level* piece of railway). The student should try to have a proper notion of what is meant by "acceleration," *rate of increase of speed:* it is expressed as a speed or velocity per second: as so many feet per second per second—note that time comes into it twice. In our units

$$\text{velocity } v = 2\,\frac{\text{feet}}{\text{seconds}} = \frac{\;}{t} \qquad (1)$$

$$\text{acceleration } f = 2\,\frac{s}{t^2} \qquad (2)$$

Let us put these two laws in the forms

$$s = vt \;(1) \text{ and } s = \tfrac{1}{2}ft^2 \qquad (2)$$

But $v = ft$ and there appears to be a discrepancy: there is, of course, none: (1) supposes the distance s to have been moved over with a uniform velocity—ft is the velocity, often t seconds from starting at nought, and the average velocity $\frac{ft}{2}$ compares with the uniform velocity v of (1).

6. If we desire to test whether there is more stress in one part of a rope than another it may be done by pulling up parts of the rope and putting in spring balances,—with a steady pull, these balances should all read the same if what has been said above is true.

The rope is elastic, and, if we could accurately show the amounts by which different forces lengthen it, it would form a spring balance. It would be found, if, for example, a force of 100 lb. stretches it so as to be 1in. longer, 200 lb. will make it 2in. longer, 300 lb. will make it 3in. longer, and so on, within limits. Again, if a strut is subjected to compression it is shortened, and the amount of shortening is proportional to the load. Let us take a bar of iron which will bear both kinds of stress. The amount by which a pull of, say, one ton will lengthen it is equal to the amount by which a thrust of a ton will shorten it; if we express this increase or decrease as a fraction of its length it is called the *strain*; the force is called the stress, and the law (called Hook's law, sometimes expressed in Latin *ut tensio sic vis*) is that strain is proportional to stress. Just as in spring balances with light springs the divisions of the scale are long compared with those with stiff springs, so different substances also vary as measurers of force. It is found useful to have a list of numbers which have been determined by experiment and which give in a convenient form a means of knowing their scales considered as measurers of forces. The number for a particular material is known as Young's Modulus for that material. This number might be given as the force in pounds which would elongate or compress a bar of 100 square inches section by $\frac{1}{100}$ of its length, but it is just as useful to say that it is the force which would elongate a one-inch bar to double its length, or compress it to no length, though it is manifest that no material will stand treatment of this kind.

The student is to remember that the word elasticity is used frequently with different meanings. Young's Modulus is called the Modulus of elasticity of a material, and it means a very different thing from co-efficient of elasticity when we are dealing with questions of impact, &c.

7. The term *momentum* gives some difficulty. If we return to our idea of a frictionless train being drawn by a rope, in which there is a constant stress or force, the train is accelerated acceleration $F = \frac{\text{force}}{\text{mass}} = \frac{F}{m}$: and the velocity after T seconds $= t\frac{F}{m}$. Now the effort of a force acting on a mass free to move for a definite time is $t\,F$, which is evidently $mt\,\frac{F}{m}$ or mv. In Newton's law where the change of motion is said to be proportional to the force, the change of *momentum* is meant, and the element time is understood; the change of motion is proportional to the force and the time during which the force acts.

We are now more concerned with accumulation of energy than with momentum. Energy of motion is imparted when a force acts upon a mass free to move *through a distance.* Energy $E = Fs = \frac{mvs}{t} = mv\,\frac{s}{t}$ but $s = \frac{vt}{2}$ where v is the final velocity $\therefore E = \frac{mv^2}{2}$.

Students who have gone over the ground in books on elementary mechanics will find it useful to look at things from the point of view here taken. Students who have not had a course of elementary mechanics may find it not easy to follow what has been said owing to imperfect knowledge of some of the terms used, but they should have no great difficulty in making up the meanings of these terms from books dealing specially with mechanics.

(*To be continued.*)

Law Cases.

Cellar Flaps: A District Surveyor's Summons Dismissed.—Mr. Charles Ansell, builder, of Chicheley Street, York Road, was recently summoned at the North London Police Court by Mr. Payne, district surveyor for East Hackney, for contravening the London Building Act in doing certain work at the Brunswick Arms public-house, Hackney. Mr. Payne's case was that the defendant had placed a new flap to the cellar of the public-house without giving him notice as district surveyor, and had used in the construction deal instead of some hard and incombustible material.—Mr. d'Eyncourt said a cellar flap could not be made of anything but wood. The Act of Parliament, moreover, gave them no ground to go upon, and the summons would be dismissed with £3 3s. costs.

Mr. Thomas Harper Wallis, builder, of Littlehampton, died recently at the age of 81 years. He went to Littlehampton about twelve years ago from Market Rasen, Lincolnshire, where he carried out many large contracts, including the building of several churches for the late Sir John Astley, but since going to Littlehampton the business has been carried on by his son, Mr. Walter Wallis.

Builders' Notes.

Mr. William Young, a well-known builder, of 114, Clapham Park Road, died last week at the age of 55. He carried on the business started by his father, the late Mr. William Young.

Woking By-laws.—A by-law has been adopted by the Woking Urban Council exempting from the operation of their by-laws, with respect to new streets and buildings, any building intended to be used exclusively as a cycle shed or toolhouse, which is erected 10ft. or more from any other building, and which is not heated otherwise than by hot water.

An Increase in Bankruptcies is shown in the Board of Trade Report for 1900–1901, dealing with the subject. In the groups of particular trades, the largest number of failures is in building, where 155 more cases and £421,396 more liabilities than in the previous year are recorded. Following, as this does, a large increase in the previous year over the preceding three years, it is clear that this trade has received an abnormal and unhealthy development.

Walsall's New Municipal Buildings.—The Municipal Buildings Committee have accepted the tender of Messrs. Armitage and Hodgson, of Leeds, to erect the new premises for £67,650. The plans which have been adopted are those sent in by Mr. James S. Gibson, and include new council chamber and committee rooms, offices for the various corporation officials, and a new town hall to accommodate about 1,700 people. The site for the new building is in Lichfield Street, and is central. The plans are drawn so as to permit the erection of an art gallery in the future if that is deemed desirable.

Change of Address.—Messrs. J. Owen & Sons, Ltd., the well known timber merchants, late of Brownhills Saw Mills, Tunstall, have removed in order to accommodate and provide for their increasing business to larger and more convenient premises, at the corner of Pinnoy Street and Scotia Road, on the tramway route between Burslem and Tunstall. They have purchased a suitable site and have built a saw mill and fitted it up with all modern machinery, including horizontal, frame, band and circular saws, planing and moulding machine, &c. Timber sheds which will store large quantities of dry woods have been erected, and there will be a siding communicating with the railway company.

Bath Stone Firms.—A satisfactory report is issued by the Bath Stone Firms. The profits for the first half of this year are returned at £19,364, and though this total is some £1,600 smaller than the corresponding figure a year ago, it does not indicate any diminution of prosperity, as interest on new debenture stock this year called for £1,760 extra. The dividend is again at the very satisfactory rate of fourteen per cent. per annum and thanks to the larger balance brought into the accounts, the amount carried forward is also larger, being £17,072, as compared with £14,678 a year ago. The company appears to be in a very strong position, and does not seem to have suffered at all by the numerous failures that are reported in the building trade.

Registration of Plumbers.—The Lord Mayor of Birmingham, at a meeting of master and operative plumbers held in the Council House last week, referred to the evils of bad plumbing, which, he said, were great and far-reaching. In presenting a number of certificates granted in connection with the National Registration of Plumbers he emphasised the importance of duly qualified men being engaged in trades which were so closely identified with the health of the community. He said it was gratifying to find that the reforms which were taking place in the trade were not forced upon them by outside pressure, but arose from an almost spontaneous conviction of the masters and men to uplift the trade and secure for it public confidence. A resolution was proposed by Mr. Bellamy, master plumber, seconded by Mr. Clarke, operative plumber, affirming that, in the opinion of the meeting, representing the masters and operative plumbers of Birmingham and the district, it would be a great public advantage if a measure be passed through Parliament securing an efficient system of registration, and urging that it is the duty of the Government to carry through such a measure in the public interest.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

To Prevent Paint Blistering.

W. G. writes: "How can I prevent paint blistering?"

A frequent cause of blistering is the application of paint to damp surfaces or to woodwork containing a large amount of resin. To prevent blistering, the paint should be of good quality, having pure old white lead as a basis. For external work, boiled linseed oil should be used, raw linseed oil being confined to internal work. Care should be taken to avoid the use of too much oil in paint, as an excess of oil also tends to blistering. The surface to be painted should be perfectly dry, and in the case of woodwork the timber should be well seasoned. Each coat of paint should be allowed sufficient time to get thoroughly dry and hard before the application of the succeeding coat. T. E. C.

Colouring Plaster Green.

SOUTH SHIELDS.—ENQUIRER writes: "Which is the best material to use for colouring plaster skimming green?"

We know of no means of colouring plaster green permanently or deep in tone. Lime is quickly destructive of most greens, but many paint manufacturers and merchants supply "lime greens," specially prepared for plastering.

Timber Sizes.

BROTTON.—CONSTANT READER writes: "(1) Kindly give the market sizes of timber used in ordinary buildings. (2) Please also name the best book for obtaining a good and practical idea of specification writing?"

(1) Timber is mostly imported into this country in the following sizes: Deals, 9in. by 3in., 9in. by 4in., and 11in. by 3in.; battens, 7in. by 2½in. and 7in. by 3in. Smaller sizes are cut from these, and, in specifying, the diminution due to saw-cuts must be allowed for. Other sizes are imported, but they are mostly inferior, being cut from the small wood. Odd larger sizes are cut from baulk. (2) "Specification: No. 4" (published at these offices, 5s. nett), is the best work on the subject.

Wood-Block Floors and Tile Floors.

EDINBURGH.—W. M. P. writes: "I have read with interest the answer to 'R. R.'s' enquiry about wood-block floors, on page 58 of your issue for September 4th. I should be glad of some further information on the subject. A certain corridor was covered with oak blocks laid on a bed of breeze-concrete, the faces of the blocks having been dipped in mastic and laid in position. The wood blocks had dovetailed grooves. First they shrank somewhat, then, a month or so later, swelled and rose to such an extent that the whole is rendered useless. I had some blocks taken up, and found that in places wedges had been inserted at the sides, between the blocks and the wall; that none of the grooves were filled with mastic; that the beds of the blocks were in many cases not wholly covered with mastic: and that the mastic was still quite soft. (1) Is the bed of breeze-concrete (with, I understand, a layer of asphalt below) good or bad? (2) Should the floating be watered, as recommended in 'Specification' for tiles? (3) Should the mastic or asphalt set hard? (4) Should the grooves in blocks be filled (the pattern was herring-bone)? (5) How should blocks be seasoned? (6) Is a good current of fresh air necessary (the corridor is heated with radiators)? (7) What about wedges? In another part of the house the floor tiles rose in the form of a square all round. They are 6in. by 3in. red tiles, and came clean away from the bed; the cement in the joints came off easily. Can you offer any explanation?"

We have heard of several very similar cases. The probable explanation of the one you describe is, that the blocks were not thoroughly dry, and shrunk after being laid, necessitating the use of wedges to keep them firm. The consequent swelling was doubtless due to their being wetted, probably when they were washed down or scrubbed; and the water having got in the joints they rose. It is usual to take particular care that the blocks are quite dry before being laid—in fact, they are often dried in an oven previously; but even then there is considerable danger of the blocks swelling when wetted, and this is the reason why they are usually made very small, because they stand better. From the proportion of the blocks in the sketch you send we should judge that they were too large; they should be about 18in. by 2in. by 3in. before being planed. The likelihood of wood-block flooring rising may be judged from the many patent systems of keying the blocks. The bed should have been tarred completely to prevent damp rising or getting into the concrete, which is always greedy of water and will retain it for a long time. Breeze-concrete is bad in this respect, as it is very porous. The grooves should have been very small, running a good way up the block, and filled with the mastic, which, if it had set hard when cold, would have thus keyed the blocks down. The blocks should be of well-seasoned wood, and kept in a dry place for a considerable time before laying, and further dried in an oven just previous to laying. Wedges will not then be required, and should not be used. A good current of fresh air should pass through the corridor in order to dry up any moisture, as we have noticed that where radiators are used without a free current of dry air dampness is very noticeable at times. On no account should the floating be wetted for wood-blocks; this is however a necessity in laying tiles, in order to prevent the concrete bed absorbing the water which is necessary for the setting of the cement. In laying tiles it is important to partially "kill" the cement by working it up as you would mortar. This is done to allow the heating and swelling action to pass off, which will blow the tiles; this also being the reason why similar precautions are taken in jointing drain pipes. It was this which in all probability caused the tiles in question to rise. The reason why they came away from the bed so easily was because they were not laid while the concrete bed was green, so that the fresh cement did not adhere to the old.

Classes in Masonry.

BRISTOL.—H. P. writes: "I have been asked to teach a class in masonry (ordinary grade). Kindly name a book with examination questions and answers in this subject; and also state if it is possible to get prints or sketches of fonts, pulpits, windows, &c., for students to work out in small models for workshop practice."

We do not think there is any book which contains masonry questions only. You will, of course, find numerous questions on this subject set at the South Kensington examinations given in Mitchell's and Rivington's books on building construction. You will also find many admirable drawings of constructive masonry in Viollet-le-Duc's "Dictionnaire," which could be used for working out models. "Details of Gothic Architecture," by J. K. Colling, will also be useful. Purchase's "Practical Masonry," Dobson's "Masonry and Stone-Cutting," and Siebert & Biggin's "Modern Stone-Cutting and Masonry" also have illustrations that might be worked from.

Cost of Churches and similar Buildings.

LONDON, S.W.—W. F. R. writes: "Which is the usual way to calculate the cost of churches, chapels and similar buildings? Is it computed on the cubical contents, or on the seating accommodation? Is there any book giving the cost per foot of different classes of buildings?"

Churches are roughly estimated by both methods — from 7d. to 10d. per ft. cube for plain brick or local stone, and more if ornamented. The cost usually works out between £7 to £10 per sitting. This method, of course, is merely haphazard guessing, and the proper course is to take out rough quantities of each trade. Coleman's "Price Book for Architects and Engineers" (E. & F. N. Spon, Ltd.) gives approximate estimates according to the systems of per ft. cube, per square, and per unit of accommodation.

Twisted Doors.

DUBLIN.—BUILDER'S FOREMAN writes: "Is it possible to make doors true which have become twisted? Some 2in. framed and four-panelled internal deal doors, moulded both sides, which were fitted and hung true in their frames a few years ago, are now badly 'in twist' and will not close properly."

In order to give a full answer to this question we should first require to know why the doors twisted. In most cases the twisting of a door is due to sagging of the head, thus preventing the top of the door closing; so that when the door is pressed in at the bottom, in order to get the lock to hold it, the top is bent out of the square, resulting in the door being badly twisted. We have found in many cases that if the doors are eased at the tops they gradually correct themselves. Another cause is that the mortices (now generally cut by machinery) are not in accurate alignment; the rails, when driven home, are thus slightly out of the square, and in course of time the strain set up increases the mischief. Sagging in the door itself also adds to the trouble. The only way to correct a really badly twisted door is to re-frame it with fresh rails. In slight cases the easing of the mortices and tenons and re-wedging might correct the mischief, but while this is being done new rails might as well be put in. However, as doors can now be obtained so cheaply we should think it would be the easiest way out of the difficulty to use new ones. Twisted doors are often temporarily straightened by taking them down, supporting them diagonally from corner to corner, hanging weights on the other corners, and steaming or pouring hot water over them. If possible, the doors are then hung on the other edge. After a time, however, the doors will be sure to go back to their old warped condition.

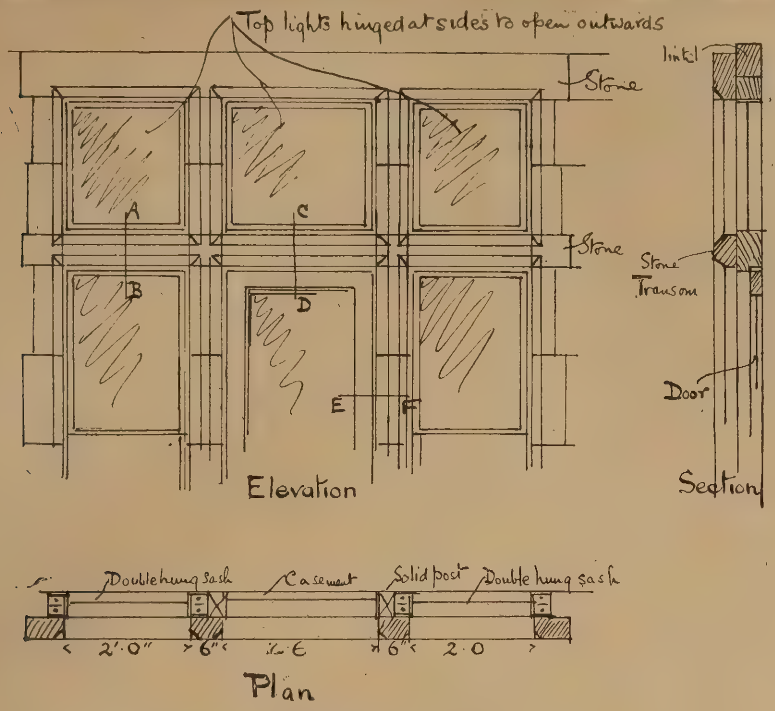
Remedying Dampness in Walls.

RICHMOND.—UNCERTAIN writes: "I have been asked to suggest a method for rendering a cellar absolutely dry. It is now very damp. I propose to excavate the ground for about a width of 4ft. round, and to the depth of footings, underpinning one part with a concrete wall, filling the space between with dry core, and relaying floor: the walls to be coated externally with asphalt ½in. thick. I also think that if I lay a land drain in the excavation, to fall to a well to be sunk about 16ft. deep, and fill up the excavation within about 3ft. from the surface of the ground, with faggots of wood, and replace the earth on top, it might act as an additional prevention. Would £60 cover the whole of the proposed works?"

The method of coating the wall outside with asphalt is the best, but we think faggots of wood would be worse than using ordinary soil; clay would be the best to fill the excavation up with. If the percolation of water is only slight, it might be stopped by cementing the wall inside, finishing off with neat cement well *trowelled*. This we have found in several cases to be effective but the wall must be cemented all round, otherwise the water will find its way to the first opening. If, however, the water comes from an underground stream being intercepted, the only remedy is to take it round the house into its old course on the other side. This can be done by laying agricultural drain pipes round; we can recommend the method from personal experience. £60 is a reasonable estimate of the cost of excavation, draining, and asphalting the outside of the walls, and this could be done in a fortnight. The walls must be thoroughly dry if they are to be asphalted. If you think the cementing of the walls inside would be sufficient, this could be done very cheaply, but we should imagine from your statement that there is a continual stream of water through the walls that an underground stream has been intercepted, and in this case the method we have suggested is the only one to overcome it.

Jobbing Clauses in Contracts.

LEICESTER.—DOUBTFUL writes: "The following clause appears in the preliminary bill of a large contract: 'Allow for each trade to attend upon all others and for jobbing work throughout the works.' Would you consider this to mean all cutting and making good holes by bricklayer, carpenter, plasterer and painter after such trades as plumber, gasfitter, electri-



WATER-TIGHT WINDOWS.

cian, specialist, whose work is included in the contract?"

Yes. The architect puts the clause in to safeguard himself, the contractor being forced in his own interest to obtain complete particulars from the architect as he goes on; otherwise, he would doubtless leave such things as gas-fittings, plumbing, &c., till the end of the job, causing numerous extras that need not occur."

Classes in Honours Building Construction.

CROYDON.—S. writes: "Kindly recommend a technical institute in London (City or South preferred) where an evening class is held in building construction, Honours, Part II., entirely separate from Honours, Part I."

We do not know of one where the subjects for Honours, Part II., are given as a special course separate from Part I. We advise you to take these subjects either at the Achitectural Association evening classes or at King's College. You could no doubt arrange to be taught only these subjects at the Polytechnic, Regent's Street, W.; the Battersea Polytechnic, Battersea Park Road, S.W.; Borough Polytechnic Institute, St. George's Circus, S.E.; or the City of London College, White Street, Moorfields, E.C.

Charges for Work not Proceeded with.

LONDON, S.W.—J. H. W. writes: "A client of mine instructed me to prepare plans, &c., for a house in the country. I did so. He then asked me to prepare another set of drawings for another house, which I also did, both of which were approved. He then gave me instructions to obtain a separate estimate for each house. A few days afterwards he stated that for the present he only intended to erect one house, and consequently signed the contract for it, with a verbal promise to the contractor that he should eventually build the second. At the same time he gave me a letter saying that he would pay me so much per cent. as architect for the one house. On several occasions I have written reminding him of his promise to build the second house, but he always avoids my question. Can I claim the usual 2½ per cent. on that house should he not build it?"

If the client has agreed to pay you according to the R.I.B.A. schedule of charges, you are entitled to 3 per cent. on the lowest estimate, *i.e.*, 2½ per cent. for plans, elevations, sections and specification, and ½ per cent. in addition for procuring tenders. If the cost would have been less than £1,000, or if special designs for furniture, fittings and decorations were entailed, you are entitled to claim more, as 2½ per cent. is not remunerative. If the Institute schedule was not agreed to by your client, you could only get at law what the court decides is a fair payment. You should make application to the client for payment, and if this is refused put the matter in the hands of your solicitor.

Water-Tight Windows.

HARRINGAY.—W. A. B. writes: "The accompanying sketch shows a three-light window. What would be the best section through A B and C D for keeping the water out above the stone transom; also horizontal section through E F.? It does not matter whether the casement opens inwards or outwards."

The accompanying illustrations show one way in which water can be kept out if the frames are properly bedded, but the sashes work out much thinner than they ought to do, and it would be better that the thickness of the stonework should be reduced to allow the sashes to be thickened to at least 1½in. Enrichments can of course be added. G. A. T. M.

"The Magazine of Art."

BRECHIN.—PERSEVERANCE writes: "Where is the 'Magazine of Art' published, and what is its price?"

It is quite absurd to write to us for such information, as it can be obtained at any railway bookstall. However, the "Magazine of Art" is published monthly by Messrs. Cassell & Co., Ltd., La Belle Sauvage, Ludgate Hill, E.C., price 1s. 4d. nett.

Surveyors' Institution Examinations.

USK.—SPRING BOW writes: "What are the subjects of common knowledge mentioned in the syllabus for the vivâ-voce Preliminary Examination of the Surveyors' Institution?"

Write to the secretary of the Institution, Great George Street, Westminster.

Bending Moment Diagrams.

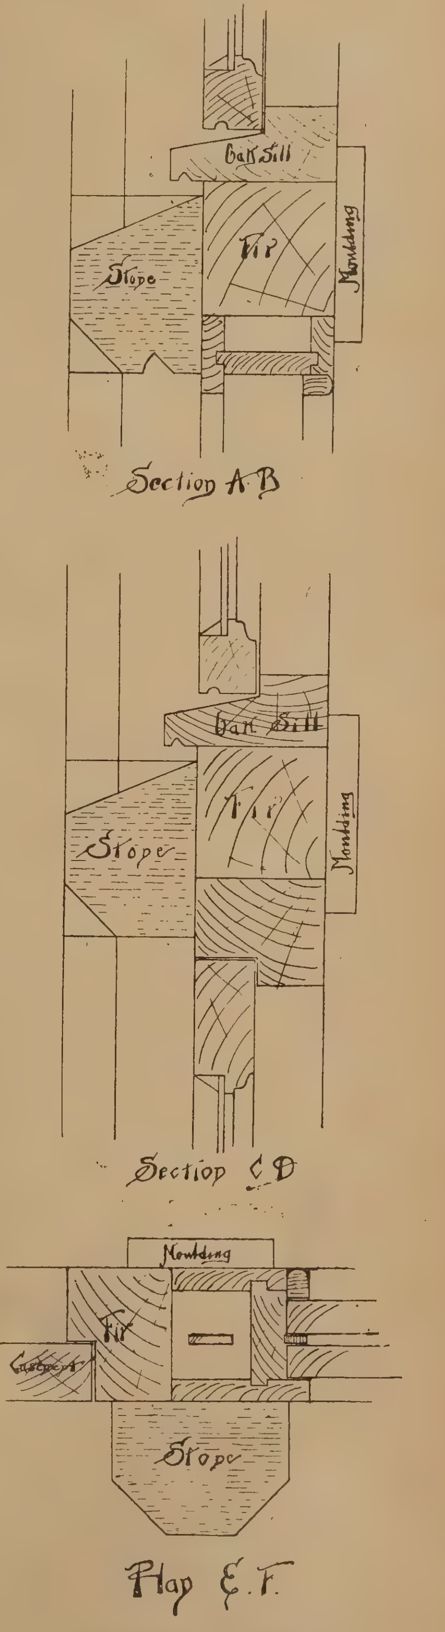
SOUTHPORT.—ACORN writes: "In working out the bending moment diagram of a beam, how is the length of pole from the line of loads determined?"

The pole is taken at any convenient distance from the load line and about opposite to its centre. The full method of procedure is explained on page 391 of our issue for December 19th last.

Green Stain for Blind Laths.

BIRMINGHAM.—A. P. J. writes: "Do you know of a green stain for outside blind laths for greenhouses that does not need varnish and will not fade? Could pine laths be stained green?"

We do not think it is possible to keep blind laths exposed to rain for long without the colour being affected, unless the surface is protected in some way so as to throw off the water. If the wood were first well soaked in boiling oil damp would not penetrate it; and the wood would not have a glossy varnished surface. The next consideration is that the colour should not fade. The following pigments are the most permanent: Chrome Green; Green Earth or Terra Verte (this is at first light in colour but darkens in time); Verdigris (this is bluish at first but turns a brighter green with age, and is much used in Russia for colouring wood roofs); Zinc or Cobalt Greens (the latter especially is per-



WATER-TIGHT WINDOWS.

manent but costly). Brunswick Greens are fairly good but turn dark in time and should not be depended upon. Copper, arsenico-copper, aniline and vegetable greens fade. The variety of Verdigris which dissolves in water might be used with a mordant. These pigments should be put on dull.

Pupils of Engineers and Municipal Surveyors.

HASLINGDON.—J. M. writes: "I desire to apprentice my son, aged 17 years, to a civil engineer and surveyor to a corporation. Can you give me particulars as to the course of study, &c., you would recommend, and the amount usually paid as premium?"

The premiums usually paid vary from £100 to £300, according to the standing of the engineer. We should advise you to communicate with several municipal surveyors who are also Associate-Members I.C.E., or Members I.C.E., and ascertain their terms. For your son to become a competent engineer and surveyor he must have had a very good education and be intelligent. The course of study would be set by the surveyor.

Masters and Men.

Swansea Building Strike.—The Swansea Master Builders' Association have, through their solicitor, written to the secretary of the men's union calling attention to the law on picketing, which, they say, will be strictly put into operation if necessary during the rest of the present strike.

The Welsh Slate Trade.—It is feared that in the immediate future the wages of the workmen employed at several of the largest quarries at the great slate centre of Festiniog will have to be reduced, owing to the accumulation of slates. One would have thought that the Bethesda dispute would have given the slate trade at Festiniog an impetus, but instead it has indirectly led to the existing depression. The unfortunate strike is more or less responsible for the introduction of American slate into this country.

The Labour Market in August.—The returns issued by the Labour Department of the Board of Trade for August show an increase in the percentage of unemployed, compared with July. Iron and steel manufactures show an improvement as against both last month and the corresponding period of last year, the total volume of employment being an increase of 0·5 per cent. and 2·5 per cent. respectively. Employment in the engineering, metal and shipbuilding trades has fallen off. In the building trades matters have continued to improve, the percentage of unemployed union members being 2·7 per cent. at the end of August, as against 3 per cent. at the end of July. In the furnishing trades employment has further declined, the percentages for August and July being 3·5 and 3·1 respectively.

The Cement Combine and Workers.—Consternation is felt by the workers in the cement trade on the banks of the Thames and Medway owing to what is believed, rightly or wrongly, to be an attempt on the part of the Cement Combination to stamp out trade unionism. Of the thirty-seven cement factories in that part of Kent twenty-eight are run by the Combination, whose employees, mostly trade unionists, number about 12,000. The village of Cliffe, which occupies an isolated situation and has a population of about 1,000, is wholly dependent on the cement industry, the only factory there, at which 227 hands are employed, being entirely controlled by the Combination. A few days ago a notice was sent by their employers to the effect that on October 10th the Cliffe factory would be closed "for repairs." The inhabitants with a dread of starvation petitioned the directors of the Combination to keep the factory open. The directors, however, in reply gave two other reasons than the one stated in the notice for closing the factory, one being that there had been insubordination on the part of two gangs of workmen, and the other, that all the Cliffe employees had decided to strike next spring. They are now, however, meeting the men in a more conciliatory spirit. Mr. Ellerman, whose recent transactions in shipping shares have attracted general attention, has secured control of the whole of the preference shares and debenture stock of the Associated Manufacturers of Portland Cement, Ltd., which remained in the hands of the founder of the company.

Strikes and Lock-out in 1900.—The Board of Trade (Labour Department) report on the strikes and lock-outs of 1900 was issued last week. Whether tested by the number of separate stoppages, by the number of workpeople they affected, or by their aggregate duration, the labour disputes of the year were considerably below the average, although in magnitude and duration they slightly exceeded those of the previous year. As in 1899, but unlike most other recent years, there was no single dispute in 1900 of such magnitude as to oveshadow all the others. Among the disputes which aroused most public attention were those affecting the Thames lightermen, the Taff Vale Railway employees, the Penrhyn quarrymen and the Staffordshire pottery workers. Altogether 648 disputes were recorded involving 188,538 persons, and the aggregate duration in 1900 of all disputes in progress was 3,152,694 working days. Thus the strikes and lock-outs of 1900 involved about 2·2 per cent. of the industrial population, and caused an average loss per head of less than half a day's work in the year. The results of the disputes as recorded were, on the whole, somewhat more favourable to the workpeople than in most recent years. Trade was generally good throughout the year, and wages continued to have an upward tendency. but in cases in which stoppages were resorted to the operatives had greater difficulty than in the previous year in securing compliance with their demands. An analysis of the causes of disputes shows that as usual questions of remuneration were the most frequent.

Engineering Notes.

The Shire Hall, Haverfordwest, has been fitted with the latest improved low-pressure hot water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, who have employed their Rahnee radiators.

New Bridge at Monquhitter.—The new bridge just completed over the Turriff Burn at Mill of Pott was formally opened for traffic last week. Mr. Ferguson, of Bogtama, Fyvie, was the contractor. The new bridge is a substantial structure of one span, in which massive metal girders, surmounted by a neat ornamental railing, are used in spanning the stream. The remaining masonry and piers are composed of strong dressed sandstone, ashlar work throughout, resting on concrete foundations. As already stated, Mr. Ferguson, Fyvie, carried out the mason-work. The iron-work was entrusted to Messrs. Abernethy & Co., Aberdeen; while Messrs. James Duncan & Son, architects, Turriff, were inspectors of works.

Electrical Illuminations in France for the Czar's Visit.—The whole of the official electrical illuminations at the Compiègne were done on the E.L.B. System of Electric Lighting Boards, Ltd., to the exclusion of all other electrical work, the illumination devices alone carrying 12,000 lamps, whilst no less than 500 garlands of lights were also provided, and further, 3,000 yds. of illuminated festoons. The whole of the official electrical illuminations on the Prefecture buildings and the Town Hall at Dunkirk were done on the E.L.B. system, the illumination devices alone carrying 3,000 lamps. The Transatlantic liner, "La Gascogne" was lit up on the E.L.B. system as well as one of the cruisers of the French fleet, the latter as an experiment for future illumination of the French men-of-war. At Paris inumerable decorative schemes were carried out for business firms on this system, but the most interesting was a design at the "Orangery" involving 4,000 lamps.

The Draining of the Zuiderzee is the subject of a recent report by Sir H. Howard, the British Minister for the Netherlands. A Bill relating to this project was introduced in the Second Chamber of the States General. The plan really consists of first enclosing, and afterwards gradually partially reclaiming, the Zuiderzee, the pumping out of the water to be effected by steam pumps. The first work will be the construction of a dam from Wieringen, in North Holland, to Piaam, in Friesland. This dam will have sluices into the North Sea. The next works will be the creation of two polders, or areas of dry land reclaimed from the Zuiderzee; the first, between Wieringen and Medemblik, to be called the "North-West," and the second, between Hoorn and Marken. to be called the "South-West." The rest will remain a fresh-water lake, but should the plan prove successful, in days to come two more polders on the North-east and South-east of the lake may be created. The two polders will be of the following areas, viz.: The North-west polder, 21,700 hectares, containing 18,700 hectares of fertile land; and the South-west Polder, 31,520 hectares, containing 27,820 hectares of fertile land. The entire work is to be completed in eighteen years. The inclosing dyke from Wieringen to Piaam will be finished in the ninth year. In the eighth year will be commenced the work for dyking the north-west Polder, which in the fourteenth year will be dry and ready for sale. In the eleventh year the similar works on the south-west Polder will be begun, and will be completed in the eighteenth year, when an area of upwards of 46,500 hectares of fertile soil will have been reclaimed. The cost of this gigantic work is estimated in round numbers at 95,000,000fl. (£7,916,667).

Trade and Craft.

Builders' Hardware.

Mr. Howard W. Meredith's new catalogue of builders' hardware is a bulky production of 300 pages, very fully illustrated. Such a catalogue hardly calls for much comment as the majority of the goods are those which form the stock-in-trade of every builders' merchant. The numerous chimney-pieces and mantel-registers shown include a few new designs, some of them comparatively good, others thoroughly bad; for example, "The Oxford" chimney-piece is simple and satisfactory, while the wood overmantel No. 208, with its graceless pediment, brackets and elaborately-turned pillars, is altogether unsightly. In the same way the cast-iron mantel-register No. 1804, showing the "Arts and Crafts" principles adopted commercially, is pleasing just as the ostentatious iron chimney-piece No. 2056, with overmantel and mirrors, offends all good taste. Tiles, gates, railings and gas fittings are similarly "showy." The catalogue is an ordinary builders' merchant's catalogue, and as such it is a very comprehensive one; but we can say no more of it. Mr. Meredith's showrooms are at 68, York Road, opposite Waterloo Station.

"Continuous" Filtration of Sewage.

The "York" compensation filter which has been erected at the sewage disposal works at York by Messrs. The Adams Patent Sewage Lift Co. (works are at York, London offices at 7, Old Queen Street, Westminster) has been in constant operation for slightly more than a year, and it is believed that filters fitted with this apparatus will deal with a volume many times in excess of that which under other circumstances would be possible, and that consequently smaller disposal works are required. This is largely due to the distributor, which during normal flow delivers the liquid spray (ordinarily) from one pair of arms alone. At times of increased flow the excess liquid rising to the level of other arms is distributed by these. The number of arms in work is thus dependent upon the flow. The apparatus adjusts itself to the volume and deals with rather than rejects an increase, a feature of extreme importance. The drenching out of the filter is accomplished automatically. The radial arms depend for their velocity of travel upon the head of liquid and angle of delivery; the depression of the latter reduces the number of revolutions made in a given time, with the result that, the duration of discharge over the entire surface being lengthened, the amount of liquid poured out upon the filter is sufficiently great to wash out any deposit which may have accumulated. To cleanse such a filter by hand is difficult and unsatisfactory. The same operation performed automatically is simple and thoroughly satisfactorily. The apparatus will work under a head of from 6in. upwards, and is made of varying types for varying needs.

Chimney-Pieces.

Messrs. Graham & Banks, Ltd., of 445, Oxford Street, W., have prepared five new catalogues dealing respectively with furniture, chimney-pieces, parquet flooring, sofas and chairs, and wall pannellings. Judging from the catalogue of chimney-pieces and grates which has been sent us, we can thoroughly recommend architects and builders to pay a visit to this firm's showrooms. We are unfortunately too familar with the chimney-pieces of the Victorian era—they still confront us in the majority of houses, and their cut pediments, senseless incision carving and miserable turned pillars make us wonder how people can continue to buy such things. Happily, however, we have come out of that abyss of design, and in the fuller light we have seen a slow but sure improvement taking place, though we are yet far from being free of the worthless creations to which we have referred. From profusion of ornament a reversion was made to nullity of ornament, kitchen severity forming the keynote for the new design. "Half a loaf is better than no bread" is certainly a wise proverb for a workaday world, but it does not apply to decoration, for it is better to have no ornament than bad ornament. In Messrs. Graham & Banks' catalogue there are several designs which show a restraint which is only too often absent; for instance, the chimney-pieces illustrated on the first few pages of the catalogue are straight-forward and constructively good, the ornament being restricted to certain portions. Plain tiles are combined with the wood in a most pleasing manner, and the ironwork is simply treated; moreover, the prices are moderate. These chimney-pieces are made in primed pine and fumed oak. Numerous other designs are shown in the catalogue, including a copy of an English eighteenth-century chimney-piece, and one in the Adams style; in fact, the firm appear to make a speciality of replicas of old designs, having thus made use of the fireplace and oak pannelling removed from one of the upper rooms of the "Old Palace" at Bromley-by-Bow (built in 1606), and two carved oak overmantels taken from a house in Lime Street, City (date about 1620). The catalogues are excellently produced, the illustrations being well printed.

Sanitary Specialities.

We have already referred on more than one occasion to the great revolution that has been effected in manufacturers' catalogues, which from miserable productions on flimsy paper have become splendid specimens of the printer's art, printed on the best paper and illustrated with photographic reproductions of the various articles. Such a catalogue is that of Messrs. Farrer, Barber & Co., engineers and sanitary specialists, of 36, Cannon Street, Birmingham. The automatic flushing closets shown include open troughs, latrines with bottom pans and risers, and auto-multi closets, the example illustrated having three pedestal closets side by side attached to one flushing tank. (The system of multiple closet has proved very successful where it is necessary for closets, though combined in ranges for flushing purposes, to be each isolated as far as possible.) Various syphon-flushing cisterns and closet seats are illustrated in the catalogue, and among the pedestal closets we notice especially the "Special," the "Coburg" and the "Acanthus." The design of these closets is very satisfactory. Several of the lavatory basins are less pleasing, but the simple lavatory and pedestal of heavy glazed white fireclay, with rounded edges (No. 223), and the "simplex shaped" lavatory basins, are excellent. Baths and their fittings, sinks, urinals, manhole fittings and other sanitary appliances are also shown, the majority of them being carefully designed. The catalogue should be consulted by all architects. We have never seen one better produced.

Euboeolith Patent Flooring.

Messrs. Zboril Miksch & Co., of Vienna, have transferred to Mr. Emil Sequin the exclusive right of using their patent "Xylolith" flooring, which has been registered as "Euboeolith." It is a chemical combination of inorganic bodies with other suitable material, and hardens in a very short time to a bonelike substance. It combines the elasticity of wood with the hardness and solidity of stone, and is antiseptic, fireproof and watertight. It is not affected either by cold, heat or damp air, nor by diluted acids, alkalis or oils. "Euboeolith" can be coloured in bulk and keeps the same colour even after long use. It is laid without any joints and can be put on underfloors of concrete, stone or bricks. A block of "Euboeolith" was tested in contact with a grindstone having a sandy surface and making 2,000 revolutions per hour. After two hours' treatment the block showed 0·299in. wear. Two blocks of "Euboeolith" were immersed in water for twenty-four hours. The weight of water absorbed was: first piece 12·9 per cent.; second piece 12·3 per cent. Blocks showed no effect whatever after being frozen to 4 degs. below zero Fahrenheit. The flooring is largely used on the Continent and is specially suitable for cotton and spinning mill floors, warehouses, public buildings, hospitals, &c., and should find a ready market in this country. It is intended solely as a finished surface to an ordinary fireproof floor of concrete or other material, no wood being used underneath, and when laid is noiseless to walk on. Mr. Sequin's offices are at 3, Victoria Street, Westminster, S.W.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

BOSTON (LINCS.).—For the erection of cookery centre, pupil teachers' centre, and evening science classes, for the Boston School Board. Mr. James Rowell, M.S.A., architect, Boston, Lincs. Quantities by Mr. W. Hoffman Wood, 14 Park Square, Leeds:—

A Contractor at Peterborough	£2,858
Other Contractors of Boston	2,193 2,150 2,110 2,095 1,960
H. D. Parker & Son*	1,929

[Rest of Boston.] * Accepted.

BOSTON (LINCS.).—For the erection of workshops for Messrs. Holland Bros., cycle makers, Boston. Mr. James Rowell, M.S.A., architect, Boston, Lincs.:—

Wm. Greenfield	£536 10	T. H. Cade	£495 0
J. W. Darby	525 0	J. Lucas*	480 0
C. Jessop	500 0		

* Accepted. [All of Boston.]

BURTON-ON-TRENT.—For the erection of shops, Church Gresley, Burton-on-Trent, for Messrs. Hunters, the "Teamen," Ltd., Hyde Road Works, Manchester. Mr. C. F. Underhill, architect, Burton-on-Trent and Swadlincote:—

W. Ward	£1,976 0	R. Kershaw	£1,699 10
C. Venning	1,800 10	E. Clarke*	1,680 0

* Accepted.

DUDLEY.—Accepted for supply and erection of the following plant, for the Electric Light and Tramways Committee: (Section B) Part I., steam-engine; Part II., dynamo:—

Ferranti, Ltd., Manchester, engine	£3,145
Electric Construction Company, Ltd., Wolverhampton, dynamo	1,969

DARLINGTON.—For the erection of 11 dwelling-houses in Woodlands Terrace, Darlington, for Mr. William Waterson. Mr. Frank Martin, architect, South End Chambers, Darlington:—

Johnson & Boyd, Thomas Street	£4,422 0
J. Jenkins, Commercial Street	3,963 10
Boyd & Sons, Mechanics' Yard	3,835 0
Veitch & Johnson,* Crown Street	3,723 0

NOTE.—Remainder all separate tenders. [All of Darlington.]
* Accepted.

EAST DEREHAM (NORFOLK).—For the erection of a pair of cottages, for the Trustees of the late Mr. J. Montague. Messrs. W. Jarvis & Son, architects, King's Lynn:—

J. W. Fisher, Fakenham	£590 0 0
Hubbard, Moody & Co., Dereham	569 0 0
G. Jeffries, Swaffham	569 0 0
Jos. Springhall, Swanton Morley	568 0 0
Chas. Smith, East Dereham	557 6 2
W. J. Larner, East Dereham	520 0 0
Horace Mack,* East Dereham	487 3 2

* Accepted.

ETTINGSHALL.—For the erection of residence, stabling, &c. Mr. S. H. Eachus, architect, Temple Chambers, Wolverhampton. Quantities by the architect:—

Residence.

L. Jones	£1,750	Willcock	£1,595
T. Skett	1,700	Ham	1,561
J. Herbert	1,625	Cave	1,557

[All of Wolverhampton.]

Drains.

Ham	£52 0	L. Jones	£44 4
T. Skett	50 0	Cave	42 0
Willcock	48 0	J. Herbert	39 0

Fence.

L. Jones	£172 0	Ham	£146 2
J. Herbert	149 0	Cave	142 0
Willcock	147 10	T. Skett	135 0

Stabling.

L. Jones	£278 0	Willcock	£248 10
Ham	257 0	J. Herbert	236 0
T. Skett	250 0	Cave	233 0

Facing.

Willcock	£65 0	T. Skett	£54 0
Cave	56 0	J. Herbert	49 0
L. Jones	56 0	Ham	46 18

GRAVESEND.—For the erection and completion of the proposed electric lighting and destructor buildings and chimney shaft near the canal basin, Gravesend, for the Town Council:—

J. Shelbourne & Co., 70, Fenchurch Street	£8,342 0 0
J. E. Johnson & Son, Leicester	8,237 0 0
Beal & Hubbard, Gravesend	8,176 18 6
J. Smith & Son, Norwood Junction	8,175 0 0
F. G. Minter, Westminster	8,030 0 0
J. Lonsdale, Swanley Junction	7,887 0 0
Thomas & Edge, Woolwich	7,697 0 0
G. E. Wallis & Son, Maidstone	7,557 0 0
Hughes & Stirling, Arundel Street, Strand	7,553 0 0
Multon & Wallis, Gravesend	7,533 0 0
F. & E. Davey,* Southend-on-Sea	7,094 0 0

Chimney shaft and foundation only.

Blackburn, Nottingham	£1,375 0 0

* Accepted.

HALIFAX.—For the erection of chimney shaft, 60 yards high, at the electricity works, Foundry Street, for the Tramways and Electricity Committee. Mr. James Lord, C.E., borough engineer:—

J. Charnock & Sons, Halifax	£3,489 12 0
Dean, Hetherington & Co., Leek, Staffordshire	2,930 0 0
Bower Bros., Halifax	2,523 5 10
Dryland & Preston, Littleborough	2,288 0 0
Myles & Warner, Stalybridge	2,217 8 8
H. Jenkinson & Sons,* 360, Queen's Road, Halifax	1,901 11 3
T. Mitchell, Hoyle Green, Warley Town	1,898 4 6

* Accepted.

HALIFAX.—Accepted for the erection of two new shops, &c. at West Vale. Messrs. Walsh & Nicholas, architects, Halifax:—
Mason, Drinkwater and Schofield.
Joiner, Mr. Thompson.
Slater and Plasterer, D. Wadsworth.
Plumber, J. Riley.

KING'S LYNN.—For alterations and additions to residence for Mr. J. I. Dennick. Messrs. W. Jarvis & Son, architects, King's Lynn:—

J. Medwell	£197 10
R. Dye	185 0
W. H. Brown	181 0
Tash, Langley & Co.*	156 10

* Accepted. [All of Lynn.]

KING'S LYNN.—For the restoration of Brush Factory after fire, for Mr. T. Adams. Messrs. W. Jarvis & Son, architects, King's Lynn:—

J. Medwell	£85 10
Tash, Langley & Co.	76 14
A. F. Foreman*	67 10

* Accepted. [All of Lynn.]

LINCOLN.—For the various works comprised in building the proposed public abattoirs in the Cattle Market, for the Markets Committee. Mr. R. A. Macbrair, city surveyor:—

W. Pattinson & Sons, Ruskington	£6,733 0
W. & M. Halkes	6,691 0
H. S. & W. Close	6 680 0
Halkes Bros.	6,619 0
W. Wright & Son	6,101 0
Lincoln Co-operative Society, Ltd.*	6,050 19

* Accepted. [Rest of Lincoln.]

LUTON.—For stabling, workshops, van sheds, &c., at rear of Nos. 8 and 10, Manchester Street, for Mr. T. Sworder. Mr. A. Wilkinson, architect, 84, Inkerman Street, Luton:—

Cain & Co.	£1,875 12	T. & E. Neville	£961 0
G. Kingham	1,353 0	A. D. Batson	960 0
D. Parkins	1,107 0	G. W. Pryer	960 0
Godfrey & Rumbles	1,042 0	Turner	947 10
Mallet & Wood	1,002 0	G. Smart	929 0
J. Tomkins	1,000 0	Taylor	827 18
G. Buckingham	964 0	A. Mardle*	826 6

* Accepted. [All of Luton.]

NEW BROMPTON.—For the erection of school buildings for 1,230 children, to be known as the Richmond Road Schools, for the Gillingham and Grange U.D. School Board. Mr. H. Dighton Pearson, A.R.I.B.A., architect, 27 Chancery Lane, London, W.C. Quantities by Messrs. Leaning & Sons:—

J. Chessum & Sons, London	£15,074 0
Leslie & Co., London	14,358 0
Henry Flint, High Wycombe	14,283 8
Charles Wall, London	14,160 0
W. C. Snow, New Brompton	13,573 18
F. G. Minter, London	13,271 0
Walter Wallis, London	13,191 0
Kirk & Kirk, London	12,736 2
G. E. D. Woollard, New Brompton	12,570 0
Executors of T. F. Barden, Maidstone	12,545 0
West Bros., Rochester	22,529 0
Wallis & Sons, Maidstone	12,385 0
H. E. Phillips, New Brompton	11,962 0
R. L. Tonge, Watford	11,730 0
Geo. Gates,* Rochester	10,800 0

* Accepted.

SNETTISHAM (NORFOLK).—For alterations and additions to shop and premises at Snettisham, for Messrs. Lambert & Sons. Messrs. W. Jarvis & Son, architects, King's Lynn:—

Robert Dye	£649 0 0
W. H. Brown	607 0 0
Tash, Langley & Co.	606 13 6
J. Chilvers, Snettisham	554 0 0
G. Chambers & Sons,* Snettisham	500 0 0

* Accepted. [Rest of Lynn.]

SOUTHBOROUGH (KENT).—For the erection of a chapel and cottage, in connection with the proposed new cemetery at Southborough, for the Southborough Burial Board. Mr. William Harmer, surveyor, 137, London Road, Southborough:—

H. Whibley, Southborough	£1,900 10 0
C. J. Gallard, Southborough	1,492 0 0
Gann & Co., Whitstable	1,380 0 0
Martin & Co., Tonbridge	1,300 0 0
H. C. Jarvis, Tonbridge	1,240 0 0
Tapener & Co., Hastings	1,235 0 0
J. Leney & Son, Tunbridge Wells	1,228 0 0
Beale & Son, Tunbridge Wells	1,220 0 0
J. Marshall, Tunbridge Wells	1,205 0 0
J. Crates & Son, Tunbridge Wells	1,179 0 0
E. Funnett & Son, Tonbridge	1,175 0 0
T. Potter,* Southborough	1,172 [illegible] 10

* Accepted.

TRURO.—For the erection of a new cattle market. Mr. M. Lea, city surveyor and engineer:—

A. N. Coles, Plymouth	£6,389
H. E. Skinner, Plymouth	5,896
W. E. Beake, Plymouth	5,598
J. Colliver,* Truro	5,179

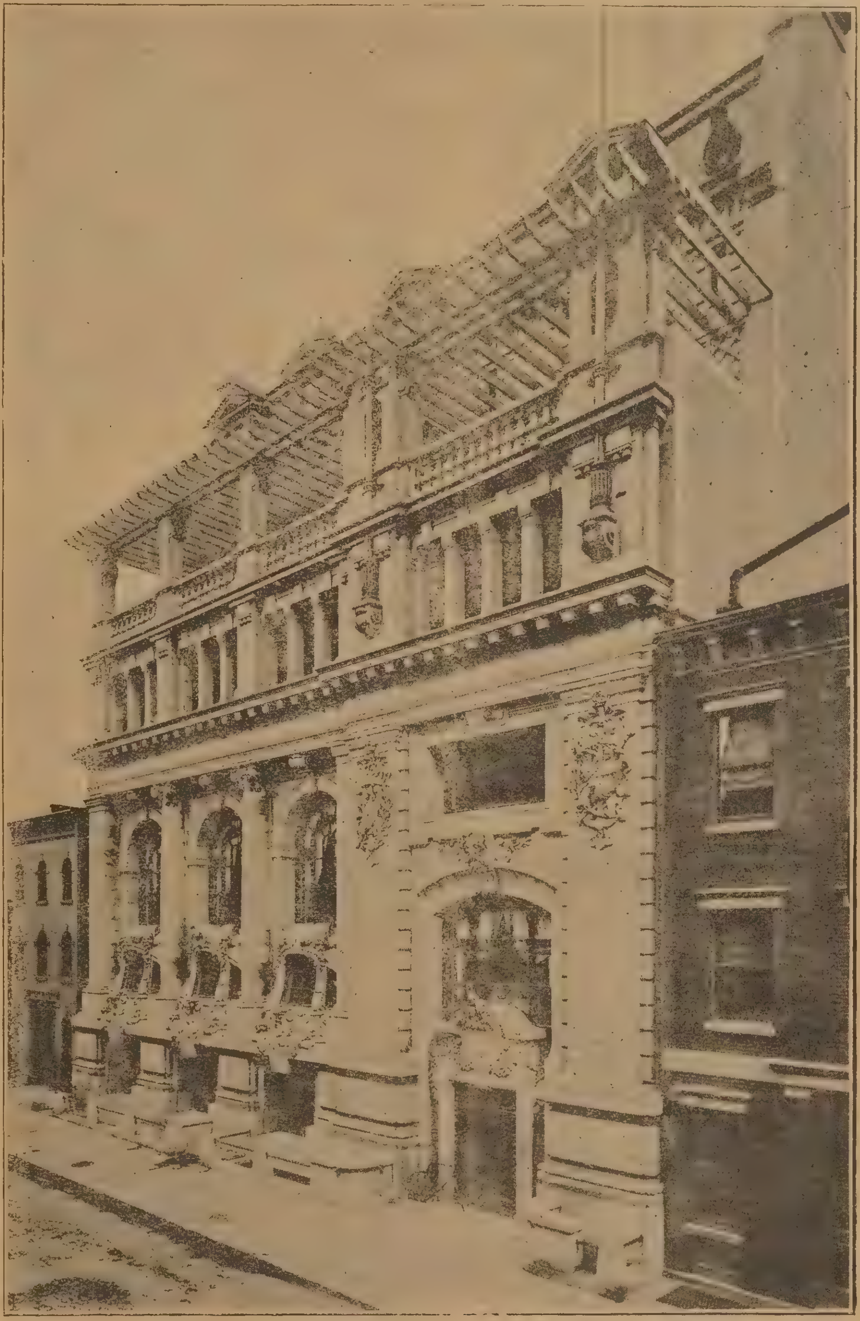
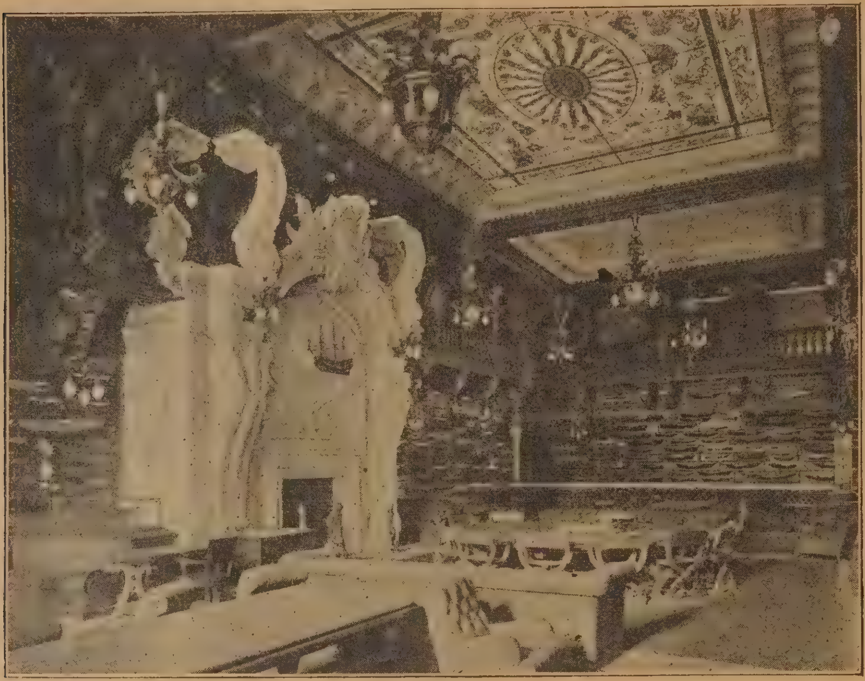
An Architectural Causerie.

The New York Yacht Club. ALL eyes are now directed to the patch of water off Sandy Hook in which two yachts strain boom and topsail for a nation's honour. It is therefore opportune to publish the accompanying illustrations of the new club-house for the New York Yacht Club, which has been erected at West Forty-fourth Street from the designs of Messrs. Warren & Wetmore. It will be seen that the architects have attempted to emblematize in the details the purposes of the building, the lower portion of the large windows on the principal facade representing (we presume) the stern of an old-time boat, with the water flowing on to the keystone below. The same symbolic treatment is exhibited throughout the interior. The model-room has a most curious chimney-piece, with Columbus and his ship discovering America behind the left-hand pilaster, models of members' yachts being arranged around the walls. The grill-room—with its strong wooden beams and brackets—gives one the impression of a large cabin. The timbers shown exposed at the top of the front facade are for the purpose of supporting an awning in the summer, when the balcony is used as a roof-garden.



CLUB-HOUSE OF THE NEW YORK YACHT CLUB. WARREN AND WETMORE, ARCHITECTS.

The Liverpool Cathedral Problem. AFTER a long discussion the site and style for the proposed cathedral at Liverpool have been selected—the site, St. James's Mount; and the style, Gothic. But this by no means puts an end to criticism; rather, such a decision lashes it to a further controversy. The battle of the sites (of which there were originally four under consideration) has been zealously fought, but it soon became evident that two were to be relinquished, leaving Monument Place and St. James's Mount for the final selection. There can be no doubt that the former is in every way the better site; but, when it became known that £200,000 would be needed for the land alone, the Cathedral Committee very naturally turned to the St. James's Mount site, which, though not possessing anything like so good an approach, will probably only cost about £50,000. Monument Place contains the chief public buildings in Liverpool—the municipal technical school, museum, library, the Walker Art Gallery, and the famous St. George's Hall. These buildings are of classic design, and any cathedral placed in proximity to them would need to be similarly treated. The St. James's Mount site has no such restrictions, for the surrounding buildings possess no architectural character—this by way of explanation only. The question which now presents itself is: "Should Mr. Emerson, whose *Gothic* design for the cathedral was chosen fifteen years ago, carry out his work?" This opens up a wide field of discussion, and we desire to deal only with the matter in its general and not in its personal aspect. As our readers are doubtless aware, the Committee intend to practically repeat what was done when the first competition was held—to invite architects (by advertisement) to submit portfolios of ecclesiastical buildings which they have erected, and from these architects to select a limited number to prepare designs. The Committee want the best possible work. If among the designs to be submitted any one excels Mr. Emerson's we consider that the Committee would be perfectly justified in adopting it in preference; but we may say that in our opinion Mr. Emerson's design is very satisfactory, exhibiting much freshness in treatment, and we doubt whether it would be surpassed. We consider, however, that the stipulation of Gothic as the only admissible "style" is both unjust and unwise, especially in view of the fact that the enthusiasm which gave life to a Revival is now long since dead, leaving the hearth cold. If the Committee were afraid of being inundated with "all sorts and conditions" of buildings which might be submitted in an open competition, the case would have been somewhat different, but in the circumstances it seems to us that no such restriction as to style should have been made. There is a good deal of talk nowadays about the reform which is urgently needed in our church-planning in order that it may be more suited to modern congregations. Certainly there is much truth in this, but great cathedrals are only filled on great occasions, and they are largely spectacular. Yet one is constantly hearing opinions which assume that such cathedrals are places always full of worshippers, whereas they are more commonly vast fabrics wherein tourists wander from wall to wall, making a great noise with their boots. Briefly, these are the pros and cons of the matter; but the Committee have decided the course they intend to adopt, and now we can but wait for the new designs. Then the discussion can be reopened with vigour.



THE MODEL-ROOM AT THE CLUB-HOUSE OF THE NEW YORK YACHT CLUB. WARREN AND WETMORE, ARCHITECTS.

THE NEW PLUMBING BY-LAWS OF THE LONDON COUNTY COUNCIL.

BY G. A. ALLAN, late Sanitary Inspector, St. Martin-in-the-Fields.

IN the United States of America the plumbing by-laws ("ordinances" they are there called) in the different cities and towns are administered by the building departments. The inspectors who are appointed to see that all plumbing work is done in accordance with the ordinances are plumbers, and their duties are restricted to the inspection of plumbing, water supply and drainage, and reporting thereon. The plumbing ordinances are periodically revised in the light of the experience gained in enforcing them.

In London the by-laws of the County Council with regard to plumbing are administered by the Public Health departments. The inspectors may or may not be plumbers. But as the supervision of plumbing and drainage is only a small part of a sanitary inspector's duties, it is less imperative that he should be a practical plumber: and in London when by-laws are passed it appears to be the intention that they shall remain unaltered *esto perpetua*.

However, in making drainage by-laws under the Metropolis Management Act of 1855 the County Council altered and amended the plumbing by-laws made under the Public Health (London) Act, 1891. The plumbing by-laws drawn up in 1893 are very incomplete, and are so loosely worded as to be capable of several interpretations. The same remarks apply to the drainage by-laws issued last June.

Under the plumbing by-laws it is not forbidden to connect the waste from a lavatory basin with the soil pipe, though bath and sink (other than slop-sink) wastes may not be so connected. Under the drainage by-laws the waste pipes from lavatories and sinks (other than slop-sinks) must be of lead, iron or stoneware, and be trapped with traps of lead, iron or stoneware. From baths, apparently, the waste pipes may be of zinc and untrapped. If, by the pedantic application of language, the word "lavatory" be used to include bath, then the use of the brass traps sent out with so many baths is prohibited.

Under the drainage by-laws the soil pipe may be fixed inside a new building, but if so fixed it must be of lead. The sizes of the sockets on cast-iron soil pipes are specified, but the amount of lead to be used in the joint is left to the judgment of the person fixing it.

The soil pipe must be circular. Provision is made for the jointing of flanged soil pipes: the joints are to be "securely bolted together with some suitable insertion," but it is not specified who is to decide whether the material inserted is or is not suitable.

Although it appears to be the intention of the County Council in issuing as a "drainage" by-law an amended form of their "plumbing" by-law as to soil pipes to supersede the latter, the statement is not directly made. Where they conflict the latter will prevail. Where they do not conflict both will presumably be in force. Both specify that "the soil pipe shall be continued upwards to such a height and in such a position as to afford by means of the open end of such soil pipes a safe outlet for foul air." It is further specified in the plumbing by-law that the above safe position "shall in all cases be above the highest part of the roof of the building to which the soil pipe is attached and, where practicable, be not less than 3ft. above any window within 20ft. measured in a straight line from the open end of such soil pipe." As this requirement is omitted from the later by-law it is presumably not now considered necessary.

A serious omission in the plumbing by-laws has been rectified. Until June last, while the soil pipes were well regulated, the ventilation pipes were not. Their size and connection to the soil pipe were defined. Now their material, weights, mode of jointing, and position are also specified. But here even the theoretical men have been at fault. Although there is no building in London needing a larger soil pipe than one having a diameter of 4in., regulations exist for soil pipes of 5in. and 6in. diameter; but ventilation pipes, which should be enlarged according to the number of closet traps ventilated and also according to the length of the pipes, need only be of 2in. diameter for any number of closets and any length of pipe, and when the ventilating pipe enters the soil pipe above the highest closet branch the soil pipe is not required to be enlarged. In St Paul, Minnesota, U.S.A., the trap ventilation pipe must extend as high as the soil pipe. It is not permitted to connect it to the soil pipe above the highest branch. It is only permitted to run the 2in. pipe for 40ft.; it must then be enlarged to 3in. for the next 30ft., and again enlarged to 4in. for the rest of its length. In the adjacent city of Minneapolis the ventilation pipe may be connected to the soil pipe above the highest branch, but the soil pipe must first be increased to 6in. diameter. To anyone knowing anything of the friction of air moving in pipes the anti-syphonage pipes seen so often in England are palpably ridiculous.

The new by-laws also regulate the size, weights, modes of jointing, materials, and position of the waste pipes from slop-sinks and urinals. Briefly, the pipes shall be of 3in. diameter, and shall be fixed very much as are soil pipes under the by-laws.

It is a pity that wash-out closet-pans were not specifically prohibited. It is also a pity that the County Council have wasted so much energy in specifying how lead pipe shall be joined to iron, stoneware to lead, stoneware to iron, lead to stoneware, and iron to stoneware, seeing that they have nullified all five clauses by allowing that "it shall be sufficient" if the work be done "in an equally suitable and efficient manner." The door is thus opened to any number of conflicting opinions. There are many ways of jointing these different pipes, none of which are any improvement on the ways specified by the London County Council.

THE GRILL-ROOM AT THE CLUB-HOUSE OF THE NEW YORK YACHT CLUB. WARREN AND WETMORE, ARCHITECTS.

WOODEN HOUSES IN FRANCE.—I.

BY JEAN SCHOPFER.

IN Switzerland the art of wooden house-building has been exemplified in one of its most picturesque forms, the principal causes which have made it so full of grace and animation being a right comprehension of the qualities and properties of wood and an application of building rules appropriate to the material employed. But the Swiss châlet does not exhaust the uses to which wood can be put. It serves other purposes, and not less interesting ones. The ancient and venerable art of carpentry has taken more than one architectural shape, and those who study its various developments are charmed by beauties which, while simple, evidence great skill.

We should like now to visit the old towns of France and seek out their wooden houses, those precious relics of the domestic architecture of the Middle Ages which reveal to those who know how to question them an abundance of curious things concerning the kind of life and the notions of art of the people of those distant times.

The wooden houses of France date from the end of the thirteenth century, from the fourteenth, fifteenth and (less frequently) sixteenth centuries, whereas the châlets belong—a few to the sixteenth century, but the majority to the seventeenth and eighteenth centuries. Thus the Swiss art would seem to be a continuation of the French, to which it is posterior. It is worth our while to stop to notice this apparent contradiction, for in explaining it we shall touch upon one of the essential points in wooden house-building and accentuate the differences of construction in the various countries.

In the Middle Ages the system of building followed in France was that called *pan de bois*. A glance at one of the photographs here reproduced will show what is meant by this term. It is a system of framework in which the resistance of the timber, serving in turn as brace or support or belting-course, is greatly increased by the multiple combinations of the joinery. The spaces left between the different pieces of the framework are pugged, that is to say, filled in with materials—old plasterwork, bricks, &c., which do not bear but simply stop up. The *pan de bois* constitutes the carcase of the house. It is, in fact, the present method of building in wood, the only one that French carpenters know; but the wooden framework is now exclusively employed for attics and upper storeys, stone or brick forming the bearing part, whereas in the edifices of the Middle Ages the *pan de bois* was systematic and general.

In Switzerland, on the contrary, we find in most cases beams piled one on another, crossed and let into each other at the angles. The timber is massive. All the beams bear equally; no combination of framework or any relieving arch or keyed-in support is needed. It is, in fact, the ancient blockbau, or log house, refined by decoration being added. The *pan de bois*, employed also in Switzerland, comes from Germany; what is peculiarly Swiss is the system of piling.

We have thus two distinctly opposite methods of construction; one consisting of clever combinations, and the other being a simple throwing together of materials. One is refined and the other primitive. Now, the stacking-up system is of ancient origin, although the examples we have are almost modern. It is even probable that it represents the earliest manner of building employed by the Indo-Germanic races. The Swiss châlets are thus connected with very ancient modes of construction, which they perpetuated at a time when for several centuries a more skilful manner of building had been developed in France and countries adjacent thereto.[*] Had we time to seek for the reasons for this we could find several. Among them would be the different species of timber. In Normandy, for instance, oak is used, a knotty wood hard to cut up and having irregular shoots. Hence the employment of frames, the pieces composing which never exceed a moderate size. In Switzerland the fir-tree abounds, with its slender stems. It has few gnarls, is easily cut, and furnishes without trouble the long regular beams required for the blockbau. We have to mention, too the geographical reasons. It is easy to see how, in the isolated Alpine valleys, unaffected by external influences, old traditions retained their sway—traditions which carry us back to primitive ages; whereas in Northern countries, near those seas on which Normans and Danes passed their adventurous existences, it is natural that the skill necessary for the building of ships should have had an influence on the development of the art of wooden house-building. These comparisons make clear the whole art of working in wood.

One general observation is called for before we proceed with our subject. The Swiss edifices are isolated. Even in the villages each châlet is an entity, with its four sides, and the great majority of the examples are country or mountain dwellings. In France, on the contrary, the wooden houses are in towns; we shall meet with scarcely a single country house. Most of them are urban habitations, and have only one face, except when they stand at a corner. The purposes to be served by these two kinds of houses are totally different, and this has given each kind a distinct aspect. In Switzerland the roof projects considerably and at the corners shelters the galleries and the staircase, which latter is nearly always outside the house. On the front, under the roof, one finds a balcony. In the town houses, however, the staircase is inside, while the sides of course could not have anything on them, being party walls. Besides, the parochial regulations prescribed a certain width of street, and this led the architects to put successive projections on every storey in order to gain room. Consequently, in narrow streets the upper parts of the houses almost touched each other, and there was no place for a balcony. Furthermore, a store usually had to be set up on the ground floor. At the top we find the gable sometimes in front and sometimes at one side. Finally, the necessity of utilising the ground to the fullest extent possible led to houses of several storeys being built. In Switzerland there are no châlets with more than two storeys above the ground floor, whereas in French towns there are many houses with five. (See the house at Angers shown in Fig. 1.)

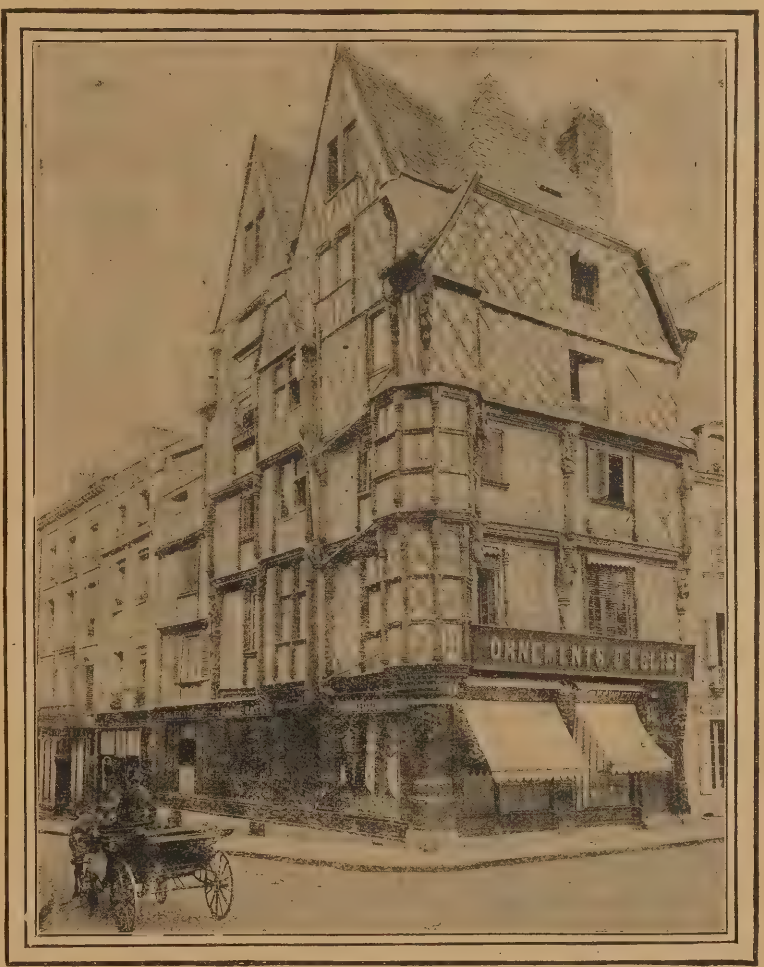


FIG. 1.—LE LOGIS ADAM, ANGERS.

We thus see that the conditions of existence were entirely opposite. In fact, no two things could differ more than the châlet and the French house differ from each other, both in arrangement and in decoration. Not only do they not serve the same requirements, but, their type once fixed, they develop under totally different conditions of living—here, in the calm and peace of a mountainous country, without excitements and unstirred by the shocks incidental to artistic progress; there, on the contrary, in commercial towns, where the increasing demands of luxury develop resources, where the political struggles of the *bourgeoisie* against the bishops and the feudal lords gave formidable strength to the middle class, in centres where arose the most admirable art movement ever witnessed since that of Greece, namely, that known as the Gothic movement, but which is French; in short, in a land which has restored monumental sculpture to the world. Here, therefore, we find a purely ornamental decoration and there a figurative one; in Switzerland, the continuation of neo-Latin tradition; in France, the influence of Gothic statuary.

* * * * *

The building of houses in wood dates back to remotest antiquity. The Romans introduced into Gaul the art of stone-working, but stone did not take the place of wood. It served other purposes—for big edifices such as temples, theatres, arenas; for bridges, aqueducts and other public works which the Romans executed in the lands colonised by them, and also, no doubt, for the villas in which the chief officers dwelt. But although the Gauls adopted stone as a building material, they continued to use wood as well, which they knew how to manipulate and turn to the best account. The woodworking tradition retained great vitality in Gaul, as is shown by the fact that when invasions destroyed Roman rule and covered the country with a new flood of barbarians, stone fell into disuse and was replaced almost everywhere by wood, even for important buildings. In the time of the Merovingians the churches, according to Gregory of Tours, were built of wood. They were ornate and for the period sumptuous edifices, covered with paintings. It was the same under the Carolingians. This explains the frequent fires which destroyed houses and churches. A large number of neo-Latin churches and Gothic cathedrals existed first in wood, and after having been burnt down were rebuilt in stone.* Nothing remains of the wooden constructions of those distant times. Besides, stone was never altogether discarded; it certainly was employed concurrently with wood for churches and cathedrals. Under the Carolingians, with the Renaissance of learning which was promoted by Charlemagne, stone played the leading part in public edifices, but wood held its own as a material for private houses.

---

[*] "The construction of châlets (piling) is most interesting to study. It is one of the systems of building which approaches the nearest in Europe to the wooden structures of primitive times."—Viollet-le-Duc.

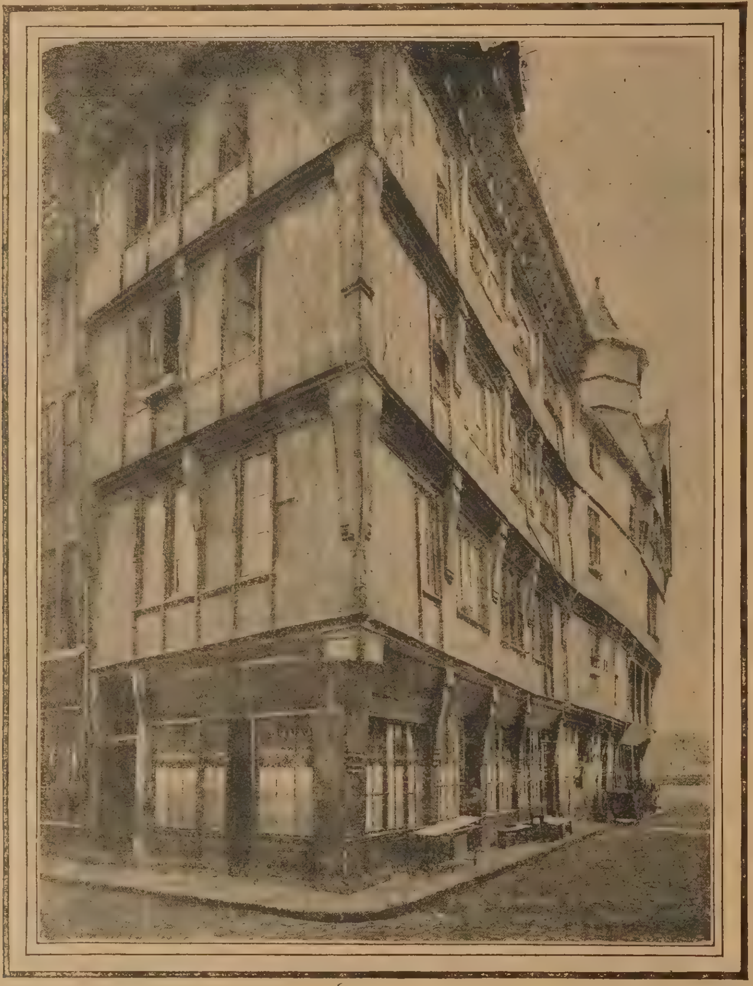

FIG. 4.—THE FORTIFIED HOUSE AT ROUEN.

In the twelfth century the influence of the great Cistercian and Cluniacensian Orders tended to the replacing of wood by stone nearly everywhere. This is the period when, in France, wood played the least important role in domestic architecture. Wherever the monks of Cluny or of Citeaux brought their influence to bear stone was first, even in the countries most deeply impregnated with Northern and barbarian elements. In Normandy stone appeared as a competitor of wood, the result being compromises of the kind shown in the Bayeux Tapestry, namely, a ground floor in masonry with an upper storey in wood. Viollet-le-Duc or M. Courajod would see in these buildings the affirmation of a Roman survival of that Northern and barbarian ideal which was designed to triumph on French soil with thirteenth-century art.

Wood had its revenge in the middle of the thirteenth century, the way having been prepared for it by political and social changes. This was the period when the *bourgeois* class prevailed in their struggle with the lay and ecclesiastical authorities. Using sometimes lord against bishop and sometimes the king against both, they extorted charters everywhere, and when their rights had been guaranteed they were able to work with a certainty of enjoying the fruits of their labours. It was a rich and hardworking class, attached by its condition and its wealth to the cities and towns. Stone, which had been used chiefly by the nobles for their castles and by the Church for its religious edifices, offered fewer advantages for the *bourgeoisie*. Wood could be worked far more rapidly and was much cheaper. Hence it was adopted by the middle class. From the end of the thirteenth century throughout the fourteenth and fifteenth, and even in the sixteenth before the neo-classic Renaissance had produced its full effects and become absolutely triumphant—a triumph destined to endure who shall say how many centuries?—wood was in general use for urban constructions.

Consequently, the buildings we have to examine are town houses, erected for merchants and people in easy circumstances. They are not distributed uniformly over France. The South, where Gallo-Roman culture flourished, and where also timber was scarce, retained the habit of using stone even for the humblest dwellings. We cannot offer a single example of a wooden house in Provence or Languedoc. As can easily be imagined, the bulk of the types are found in the West—Brittany, Vendée, Normandy—and in the North. There are a few in the centre and in the East. In Dauphiny and in the mountainous districts there are some châlets which closely approach the type most common in Switzerland—square beams piled one on top of another. Finally, in Normandy there still existed about fifty years ago some houses surmounted by a piece of wood in the shape of a crest, which connects the Norman edifices with the Norwegian and general Northern style.

At Angers there is a fine corner house (Fig. 1) which shows in a clear manner a few of the characteristics of urban wooden houses. It is called *Le Logis Adam*. The *pan de bois* is in lozenges, with the sablière beams strengthened, distinctly marking the division into storeys. The corbelling is not pronounced. The walls are divided into panels by vertical beams, which are ornamented and decorated. The house has a picturesque aspect; it is symmetrical and ingenious. At the corner is a *bretèche* with five faces, built corbelwise. Very often the *bretèche* served as a staircase which, as in most houses of the Middle Ages occupied by a single family, was inside and went directly from the hall to the floor above. Sometimes, however, the *bretèche* simply enlarged the hall and formed a pleasant corner nook, whence, through a couple of small windows, one could see far up the street. On one of the fronts is the main door (on the other was also a door, but it has now disappeared) surmounted by a projecting *pan de bois* reaching to the roof, which has two gables on one side, a piece of wall forming the coping on the other front. The roofs are covered with shingles. We see shingles again over the sablières of the second floor, to keep off the rain. We have met with the same method of protection, so necessary to wooden constructions, in more than one Swiss châlet, where it is carried out with a logic that goes to an extreme. The framework is in well-preserved oak. It is to be noted that timber keeps much better when exposed to the open air than when it is covered with a coating of plaster. The plaster, by preventing the action of the air, keeps the wood in a constant state of dampness which soon eats into and deteriorates it. The woodwork constructed by those excellent carpenters of the Middle Ages has lasted several centuries, and would endure still longer if it were not that these pacific and civilised times of ours are more destructive to the ancient beauties than the most troublous periods of the past. It is to be feared that the time is not far distant when there will not remain a single wooden house to tell us how those of bygone days loved to live, what a taste they had for art (although we often call them barbarians!), and how well they displayed this taste in matters of everyday-life. We have made art a thing for museums. Our houses are comfortable (not invariably, though), but by no means artistic, and soon there will be no place, even in the remotest corners of France, for the wooden walls so dear to her ancestors. More than sixty years ago Pugin drew some of the old timber houses of France, with details of their decoration.* After a series of fine old models comes the last plate, entitled "The Present." It pictures some intrepid workmen cutting up pieces of beautifully carved timber belonging to old houses. To finish as quickly as possible with the past, they are throwing the fragments into an immense fire.

The carved decoration of the house at Angers is thoroughly in keeping with the spirit of the Middle Ages. How well we realise that we are in a part of the world where wood-carving is of all arts the most living, the best known and the most familiar! On the ground floor, under the *bretèche*, the corner is occupied by a tree, and everywhere—on the columns, the beam, and window-frame supports—we see angels, old women squatting, grinning heads, beasts and battles, monsters, and, what is really exceptional, a centaur, the whole forming a series of subjects and figures which give an appearance of life and animation to the old house. We do not assert that these carvings are of great artistic merit, but they are in their place, they are not pretentious, they express what they are intended to say, and bear witness to an attention to art

---

* There exists at Troyes, in the Cancleus quarter, a wooden church, called the Chapelle Saint-Gilles, which is the only specimen still standing of a kind of building very common in olden times.

* "Details of ancient timber houses, XVth and XVIth centuries, from those existing at Rouen, Caen, Beauvais, &c." By A. Welby Pugin. London, 1836.

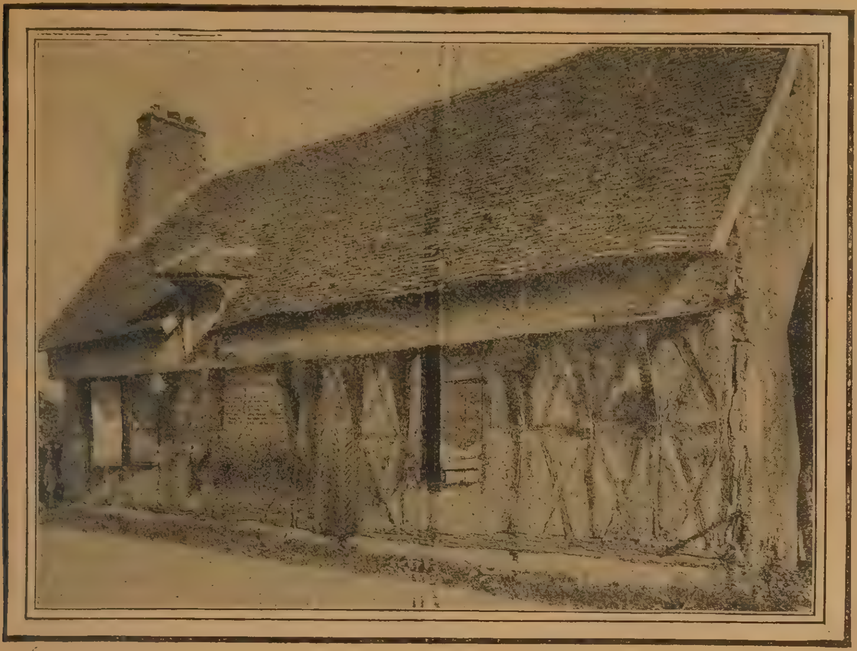

FIG. 2.—OLD "MAIRIE" AND SCHOOL-HOUSE AT FONTAINE-EN-SOLOGNE.

which was as common then as it is rare nowadays. Before leaving "*Le Logis Adam*" we must note the fine projections of the sablière beams and the strong accentuation of the window frames. These marked reliefs are quite in accordance with the best traditions of woodworking.

Fig. 2 is a rustic model, the only one we are able to offer. It is the old town hall of Fontaine-en-Sologne (Loir-et-Cher). The building is the simplest that could be, and the least ornamented, consisting of only one floor, on a level with the ground. The walls are schematic. Note how ingeniously the big beams of the roof are upheld by a piece of timber resting on a middle beam. It is impossible to fix the date of this house to a couple of centuries. When there are no carvings which will guide one it is often daring to speak positively, as the traditions of a trade remain fundamentally the same for ages. The primitive framework having once been found, it continued to subsist practically unchanged. The only guide to the date of an edifice are the additions made at later periods. In regard to the old town hall of Fontaine-en-Sologne, we would draw attention to the survival of an ornament of the highest antiquity—we mean the decoration in diagonal laths reproducing the decoration applied to stone or pottery by the Gauls many centuries before the Roman conquest. See as an example of this the celebrated Gallic warrior in the museum at Avignon, on whose shield there is the same kind of ornament. We are not aware that it has been remarked before on any building.

Reverting now to urban dwellings, we have in Fig. 3 the Château at Thiers, a fifteenth-century house with a *pan de bois* of regular arrangement, the traditional corbellings, a shop on the ground floor, and a handsome roof with a shapely gable whose projection is supported by a frame the lines of which are most harmonious. The proportions of this house are excellent, and the roof is exceptionally elegant.

The "Fortified House" at Rouen seen in Fig. 4 is much more massive. It has a rude aspect. The solid arris, the big horizontal beams of the first floor, protected by boards, the coping and the turret, speak of a troubled period and the need of being able to defend one's house in case of an outbreak. Rouen, which is so rich in art, will furnish us with other examples more ornate and delicate. Indeed, in Fig. 5 we have one of the most richly decorated wooden edifices that has come to our notice.

The method followed in this case differs from what we have seen in the preceding examples. The *pan de bois* is entirely covered with carved boards, and the house has the appearance of a richly-worked piece of wainscotting. It is the flaming Gothic style, and we can readily fix the fifteenth century as the one in which the house was built. The carvings are most ornamental; the frieze which crowns the first floor has a fine effect, but some people may think that this decoration, rich though it be, is not properly architectural, and that the house lacks the relief which wooden constructions often present.

The houses which follow are of quite another character. The first of them (Fig. 6) dates from the fifteenth century and is located at La Rochelle. It is distinguished by an arrangement of parallel vertical beams going from one storey to another and crossed by a single beam placed diagonally. The intervals are filled with white plaster, from which the dark lines of the beams stand out strongly. The general decorative effect is very curious. The arrangement has been largely copied in English for modern country houses, probably without any knowledge of its origin. The ground floor and the entresol of the house at La Rochelle are in stone; then, on a large corbel supported by stone consoles, comes the woodwork.

We have selected a specimen in Brittany which is to a great extent similar (Fig. 7). These houses are situated at Auray, the celebrated place of pilgrimage. There is the same kind of vertical arrangement of the beams, although the house is laid out in a totally different manner from the preceding one. Many other examples might be cited, but those given are sufficient to illustrate this manner of construction. We will add, however, on account of its elegant first floor and its fine crowning frieze, the "Hotel du Grand Cerf" at Andelys, whose walls are relieved by console beams which have a most happy effect (Fig. 8).

(*To be concluded.*)

The Hull Memorial to Queen Victoria.—The special committee for the Queen Victoria Memorial which is to be placed in the centre of the proposed City Square at Hull met last Friday to make a selection from the designs submitted. The cost of statue and pedestal is not to exceed £2,750. Drawings were exhibited from Prof. Edward Lanteri, Mr. Henry C. Fehr, Mr. P. McCrossan, Mr. Toft and Mr. F. W. Pomeroy. It was decided to invite Messrs. Pomeroy, McCrossan and Fehr to submit models of their designs, for which the committee agreed to pay £25. The committee includes the following architects: The Mayor (Alderman Gelder), Mr. F. S. Brodrick, Mr. J. Bilson and Mr. Jacobs.

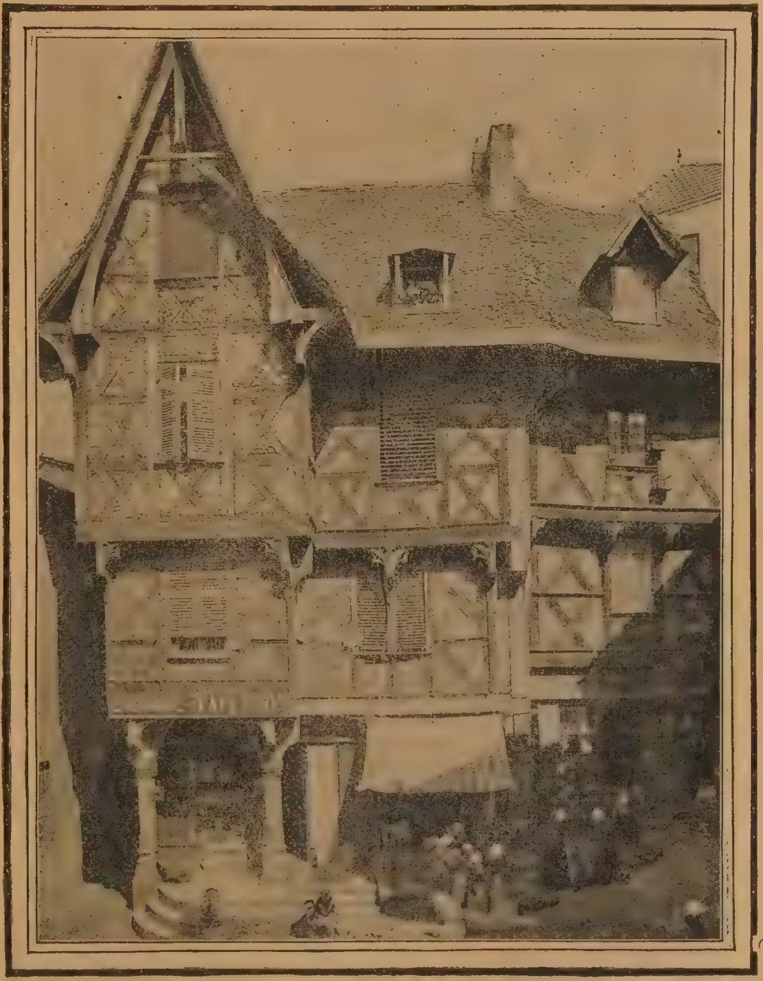

FIG. 3.—CHATEAU AT THIERS (A FIFTEENTH-CENTURY HOUSE).

Correspondence.

Barfreyston Church, Kent.

To the Editor of The Builders' Journal.

London, S.W.

Sir,—It is not generally known that this church (illustrated in your issue for September 18th), which dates from the year 1080 and is pure Norman without any subsequent additions, was taken down and rebuilt about sixty years ago.

The circumstances of the rebuilding are thus related in the history of the Gillman family by Mr. A. W. Gillman, the grandson of Coleridge's friend, Dr. James G. Gillman, of Highgate, in whose house (No. 4, The Grove, Highgate) Coleridge passed the last eighteen years of his life:—

"After acting for a short time as undermaster at the Highgate Grammar School, he (the Rev. James Gillman, son of Coleridge's friend) was presented by St. John's College, Oxford, to the living of Barfreyston, Kent, in October, 1836, a village situated about half way between Canterbury and Dover, celebrated for one of the most beautiful small Norman churches that exists in England. This church, which was probably designed by the architect and built by the masons employed at Canterbury Cathedral, is remarkable for its beautiful carved south door, circular Norman window and carved work outside the church.

"Owing to its age and the subsidence of the soil—the church standing on a knoll of ground which had been excavated for graves—the walls had become much cracked and out of the perpendicular, so that the stability of the whole structure had become endangered.

"The Rev. James Gillman soon after his presentation saw that the restoration or rebuilding of the church was inevitable. At that time but few old churches had been restored and the subject was but little understood. The popular idea on the subject was the old churchwardens' fashions of beautifying and adorning by plastering and whitewashing. The new rector superintended the work himself, with reverent care, under the direction of Mr. Twopenny, architect. It was necessary to take down all the principal walls down to the foundations. Every stone was carefully numbered and laid in its place on the grass of the surrounding churchyard, the greatest care being taken not to remove any of the lichen or moss that had grown on the outside stones, but only to clean and remove the churchwardens' whitewash where necessary. When the church was rebuilt, all the stones were placed back exactly in their original position, the only difference being that they were upright and exact in their fitting as the church has been 600 years before."—("The Gillman Family: The Gillmans of Highgate," pp. 159-60.)

The author of the above does not speak from actual observation, as he was not born until 1843, and the rebuilding appears to have taken place shortly after his father's induction to the living of Barfreyston in 1836, probably about 1840. When the walls were taken down the original roof was removed and was replaced by a deal king-post roof. A stone pulpit and font from the designs of Mr. J. P. Seddon were placed in the church a few years ago. The church was measured and drawn in 1888 by Mr. Detmar Blow, and the drawings were published in the Architectural Association Sketch Book, N.S., vol. 10 (Kent).—Yours truly,

JOHN HEBB.

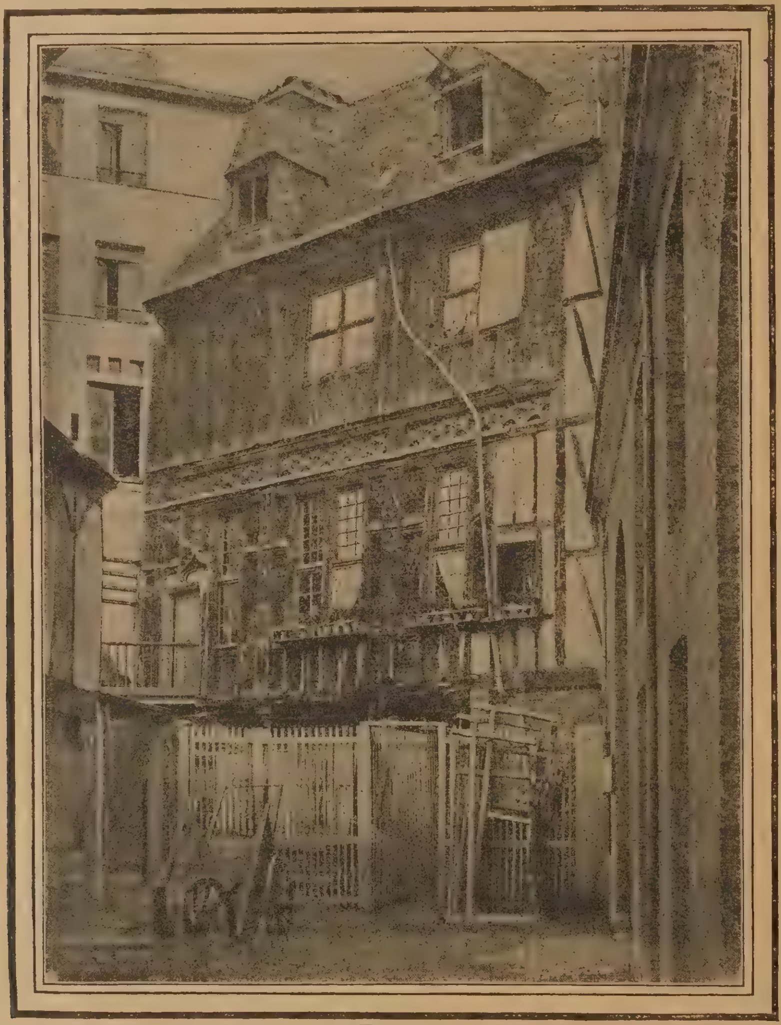

FIG. 5.—A GOTHIC HOUSE AT ROUEN.

The London Building Act, 1894.

To the Editor of The Builders' Journal.

London.

Sir,—Allow me to point out that the remarks published on p. 81 of your issue for September 18th relative to the above Act were misleading. The fourth section of the Act provides that the "Act shall, save so far as otherwise provided, extend to London and no further," and section 5 (40) defines the expression "London" as "the administrative county of London"; that is to say, the area constituted by the Local Government Act, 1888 (51 and 52 Vict., c. 41), which extends from Highgate on the north to Sydenham and Penge on the south, and from Kilburn on the west to the river Lea on the east, and includes the City of London. Part III. of the Act, which relates to lines of building frontage, does not apply within the City. There is a further exemption in favour of the City in section 9 (4, 5) as to wooden structures; in section 84 as to signs and lamps; in section 164 as to by-laws from which the City is exempted; as to obstructions in streets in section 199, and as to certain buildings, namely, the Mansion House, Guildhall, Royal Exchange and the Bank of England; but with these exceptions the London Building Act applies to the City of London, the Act being administered by four district surveyors.

The Corporation of London from an early period made ordinances embodying regulations with respect to building without the intervention of Parliament, the Lord Mayor being supreme within the City. The main object of these regulations was the prevention of the spread of fire. One of the earliest of these ordinances prohibited the use of thatch as a roof-covering and required roofs to be covered with incombustible materials.

The Great Fire of 1666 appears to have directed the attention of the Legislature to the necessity of further safeguarding the City, and in the following year, 1667, an Act was passed for rebuilding the City of London (19 Car. II., c. 3), consolidating the various enactments with regard to building. This was followed in 1670 by a further Act entitled "An additional Act for the rebuilding of the City of London, uniting of parishes and rebuilding of the cathedral and parochial churches within the said City" (22 Car. II., c. 11); and these statutes, together with an Act passed in 1707 to prevent the mischiefs that may happen by fire (6 Anne, c. 31), form the nucleus of the law with relation to Metropolitan buildings.

In 1724, in consequence of litigation arising out of party walls, a special Act (11 Geo. I., c. 28) was passed to provide for the apportionment of the costs of rebuilding these structures, the provisions of which were compulsory within the City and its liberties. These provisions did not apply to the City of Westminster and the outlying parishes, which were not included in the Building Act until some time after. Other Acts followed, but it was not until 1774 that an Act was passed (14 Geo. III., c. 78) which incorporated the leading principles of the law concerning these matters and embraced all the material provisions of the former statutes. In the words of Mr. Noel H. Paterson in his introduction to Woolrych's edition of the Metropolitan Building Act, 1855, "the safety of premises against fire, the architectural disposition of party walls, the compulsory process to make parties assent to such erections, the duties of district surveyors, the rewards given for activity in bringing up engines to a fire, and the general forms of procedure necessary towards carrying out the Act—all these were prominent features in this statute." Notwithstanding its defects, this Act remained in force until the passing of the Act 7 and 8 Vict., c. 84, which not being found satisfactory was for the most part repealed by the Act of 1855 (18 and 19 Vict., c. 122), by which London buildings were governed until the passing of the London Building Act, 1894.—Yours truly, J. H.

Masonry Classes at Battersea Polytechnic.

To the Editor of the The Builders' Journal.

London, S.W.

Sir,—In your issue for September 18th you state that the class in masonry at Battersea Polytechnic is a new departure. Allow me to point out that this is a mistake, as the masons' classes were started at Battersea when the Institution opened, and were conducted for about three years by Mr. Henry Flint, whom I succeeded. I am now just starting my fifth session as instructor of these classes. I may also state that five County Council evening exhibitions, value £10 each, and various certificates from the City and Guilds of London, have been awarded to Battersea mason students.

The only alterations in the syllabus for the present session are that the elementary class meets on Tuesday instead of Friday, and the advanced class on Thursday instead of Wednesday.—Yours truly.

JOHN WORNELL.

"The Magazine of Art."

To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—If your simple-minded Welsh correspondent had enquired when the "Magazine of Art" was first published, he would have been asking a question difficult to answer. The first three volumes are bibliographical curios, for none of them possess either preface, date or any indication of the time of their issue. But I happen to be in a position to state that the first number appeared in January, 1878. Underneath an etching by Hubert Herkomer which forms the frontispiece to the next year's issue occur the words "Magazine of Art, Vol. II.," but there is absolutely no date given, Vol. III. being similarly dateless.

When the publishers' attention was drawn to these odd omissions some years ago Mr. M. H. Spielmann explained that the first three years' issues were never put into volumes by Messrs. Cassell & Co., as they did not feel at all sure until the fourth year that the magazine was going to live.—Yours truly,

HARRY HEMS.

WORKMEN'S DWELLINGS AT BRISTOL.

WORKMEN'S dwellings are being erected at Bristol, in accordance with the requirements of the Local Government Board, for the purpose of re-housing those persons whose dwellings have been pulled down under various schemes of street improvement. Four sites have been selected, all in densely-populated districts, and sixty dwellings are in course of erection. The dwellings are divided into two classes; a first-class house contains a living-room 14ft. by 13ft. 10in. by 8ft. 6in.; two bedrooms, average size respectively 14ft. by 8ft. by 8ft. 6in., and 9ft. 3in. by 9ft. by 8ft. 6in.; washhouse, 8ft. by 4ft. 6in. by 8ft. 6in. Maximum number of persons, five. The second-class houses contain living-rooms, 14ft. by 13ft. by 8ft. 6in.; bedrooms, 12ft. by 9ft. 6in. by 8ft. 6in.; washhouse, 8ft. by 4ft. 6in. by 8ft. 6in. Maximum number of persons, three. The following are the sites upon which the various dwellings are being erected: Chapel Street, St. Philip's, fourteen first class, ten second class; Bragg's Lane, St. Jude's, six first class, four second class; Millpond Street, Baptist Mills, sixteen first class, four second class; Mina Road, two first class, four second class. The buildings are of red bricks, and the roofs are covered with double Roman tiles. The tenements are built in pairs, one situated on the ground floor and the other on the first floor. Those on the ground floor are approached direct from the street, but those on the first floor from an iron verandah 3ft. wide, which runs the whole length of the building and is reached from the street by a wide open fireproof staircase. The living-rooms are well lighted and provided with an open kitchen grate with oven. Each bedroom has a fireplace fitted with a mantel register grate. In the washhouse is a boiler and small coal cupboard. The floors are of cement-concrete floated up to a smooth face. The dwellings on the ground floor have a back as well as a front entrance, but those above can only be approached from the verandah before referred to. At the back of each block of tenements is a spacious yard laid with tar paving and is available for the use of all persons occupying the dwellings. Galvanised iron ash-bins are provided for general use. The drainage of the buildings has received special attention, and each pair of tenements has an intercepting chamber between it and the main drain. The drains are ventilated throughout.

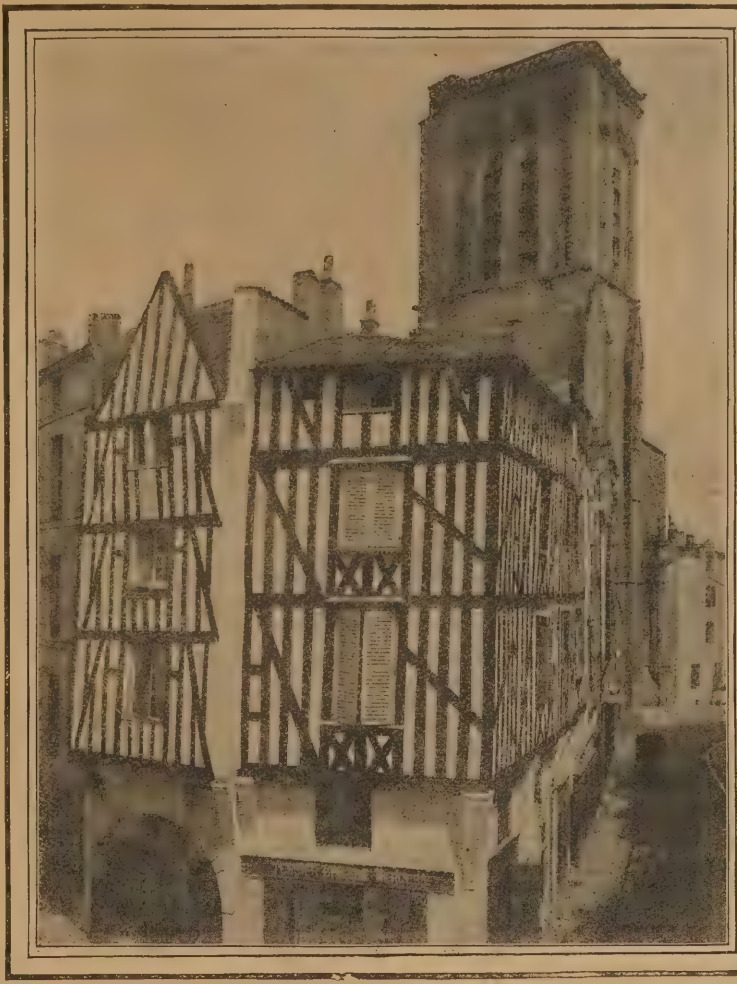

FIG. 6.—A FIFTEENTH-CENTURY HOUSE AT LA ROCHELLE.

Views & Reviews.

Oblique Bridges.

Oblique bridges are now of almost everyday occurrence in railway design, but they nevertheless still cause problems of considerable complexity and difficulty, for in no class of structure is accuracy of detail of greater importance; an error apparently insignificant at the commencement of the work increases as it progresses, until the stability of the arch is materially affected. The important feature in the construction of an oblique arch is the form of the beds which divide the courses of brick or stone of which it is built up. In an ordinary square arch the coursing beds are all plane surfaces, which have their sides parallel to the axis of the arch, but in an oblique arch the coursing beds are spiral surfaces, which wind around the axis of the arch, and the joints in the faces of the arch are not square to the coursing joints. Of course various parts of the arch can be determined geometrically by projections and developments from the plans and elevations, but as these are necessarily drawn to a comparatively small scale all the dimensions should be calculated from the ascertained properties of triangles and surfaces. Mr. Campin describes in a most lucid manner two methods of making these calculations: in one of them trigonometrical equations are employed, which is the more elegant, and in the other the result is obtained from the properties of right-angled triangles. Such scientific methods are now being increasingly employed in masonry; and if they are adopted, full working drawings being prepared, there is no reason why the voussoirs, coursing and other stones should not be wrought in the quarry ready for fixing as soon as they come on the job. The book should be read by anyone possessing a knowledge of mathematics as an example of modern methods of stone-cutting and the best methods of exact scientific engineering; it is, moreover, a good model of what a contribution to one branch of work should be—concise and free from extraneous matter.

"A theoretical and practical treatise on Oblique Bridges in Stone and Brick." By Francis Campin. London: The Publishers of the "Railway Engineer," 3, Ludgate Circus Buildings, E.C.

A Timber Ready-Reckoner.

Hall's Ready-Reckoner gives at a glance the superficial contents in feet, inches, and parts, of boards, deals, battens, &c., ranging from 1ft. by ½in. to 50ft. by 3ft. The calculations have been carefully made, and will no doubt be widely appreciated by all those engaged in timber transactions, such as the checking and making-out of invoices, &c. Tables like these, arranged to facilitate instant reference, are somewhat scarce in branches of trade particular to the building industry, and the compilers of these handy works deserve every support, as without such tables in an office constant repetition and mental labour of a wearisome and unedifying character are entailed, or else there is a needless waste of time incurred in preparing them.

"Hall's Superficial Ready Reckoner for Boards, Deals, Battens, &c." Compiled by Robert Hall, Builders' Surveyor, of Bury. Price 1s. nett. Bury: "Times" General Printing Works, 2, Cross Street; London: E. & F. N. Spon, Ltd., 125, Strand, W.C.; Manchester: John Heywood and A. Heywood & Son.

The New Loges in the Ecole des Beaux-Arts at Paris to be used by the competitors for the Prix de Rome are almost finished, and the walls are about to be whitewashed on which many interesting sketches are drawn, among them being a spirited cavalier by Regnault, the famous battle painter. The students wish these souvenirs to be preserved, and they have petitioned M. Dubois, director of the School of the Beaux-Arts, to command the workmen not to obliterate the precious *croquis*.

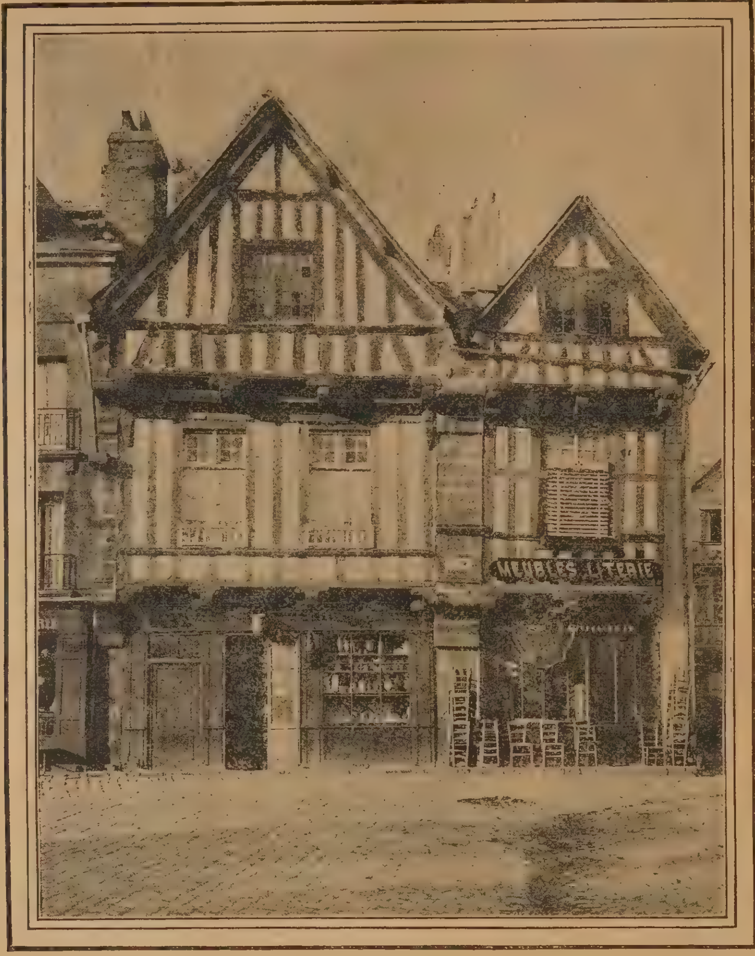

FIG. 7.—WOODEN HOUSES, PLACE DE LA MAIRIE, AURAY.

A NEW CHURCH IN LAMBETH.

THE United Methodist Free Church and Schools, &c., Fentiman Road, South Lambeth, S.W., were opened recently. The buildings are designed in Perpendicular Gothic, freely treated. The facings are of red bricks and the dressings of Bath stone. The roofs are covered with green slates. The church, school and church-parlour gables all face Fentiman Road; the school, however, is well set back to give prominence to the church. A bold square tower containing an angle entrance and staircase to a small end gallery stands at the corner, and is terminated by a small lead-dressed spirelet and vane. An octagonal narthex is a feature in front, and this contains the two main entrance doors to the church, which consists of nave, transepts and apse with side organ chamber, opening by arches into both apse and church. Accommodation for the choir is provided in the apse. A richly-traceried and carved stone-pulpit and dwarf screen on either side extend across the apse. A large platform, with oak Communion table and chairs, is placed in front of the pulpit and is surrounded by an oak handrail, supported by carved oak newels and wrought-iron and copper standards. The seating is circular on plan. The apse arch is in moulded Bath stone, supported by shafts with carved caps. The transept arches are carried on dwarf bellied Irish green marble columns with stone caps and corbel bases. The accommodation is for about 650 persons. A large schoolroom (which is arranged to be divided off into a number of classrooms) with gallery around with wrought-iron girdle front is provided, and also church parlour, vestry, ladies' working-room, library, infants'-room, kitchen, with commodious lavatories, &c. The door furniture is of hammered copper. The whole of the block is lighted by electricity, the fittings being of wrought-iron and copper work. A low-pressure hot-water heating system has been adopted. The entire block has cost about £7,000. Mr. J. O. Richardson, of Albert Works, Peckham, S.E., was the builder, and Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, of 5, Clement's Inn, Strand, W.C., were the architects.

THE CHANGE AT RICHMOND.

TIME was, not more than eleven years ago, when the river below Teddington and from Richmond down to Wandsworth was, at low water, a sight to be shunned. Seen from Richmond Hill the view was poetical enough, but those on the river-banks saw that what there was of the stream at low water barely trickled through mud banks to hang sluggishly in pools. Old Richmond Bridge, built in 1777, looked complacently on all this for a century and a quarter. But a new bridge was to come. Richmond Borough Council obtained powers and £40,000; the Thames Conservancy contributed £20,000 more; and the two bodies built a foot-bridge lower down the river, with the South-Western Railway Bridge between the two. Deftly inserted in slides of the foot-bridge were sluices, which would hold up the stream at low water far enough to ensure the beauty and the utility for pleasure purposes at least of this part of the Thames at Richmond.

Naturally enough, the communities lower down the stream opposed the Bill for the new sluices, not so much on the ground that Richmond would be made more beautiful as that their towns might suffer from drought. As a matter of fact, though Richmond has been brightened, the towns below are little, if any, worse off than before; save, possibly, Kew on the one side and Isleworth on the other. Nevertheless, they all gathered representatives together from Brentford to Wandsworth, on the initiation of Hammersmith, to plan a scheme for fixing another weir below Wandsworth Bridge, in the borough of Battersea. Mr. Pritchard, C.E., estimated the cost at £220,000. The London County Council was approached, but declined to receive a deputation, and since the death of Mr. Pritchard the project has hung fire. Wandsworth and one or two more boroughs were not exactly hostile, but were indisposed to enter on the scheme. Hammersmith has further mooted in committee of Council a suggestion for a towing-path or footpath in their district along the Middlesex bank of the Thames similar to that on the Surrey side, but there, again, the cost renders the scheme all but hopeless unless the London County Council steps in.

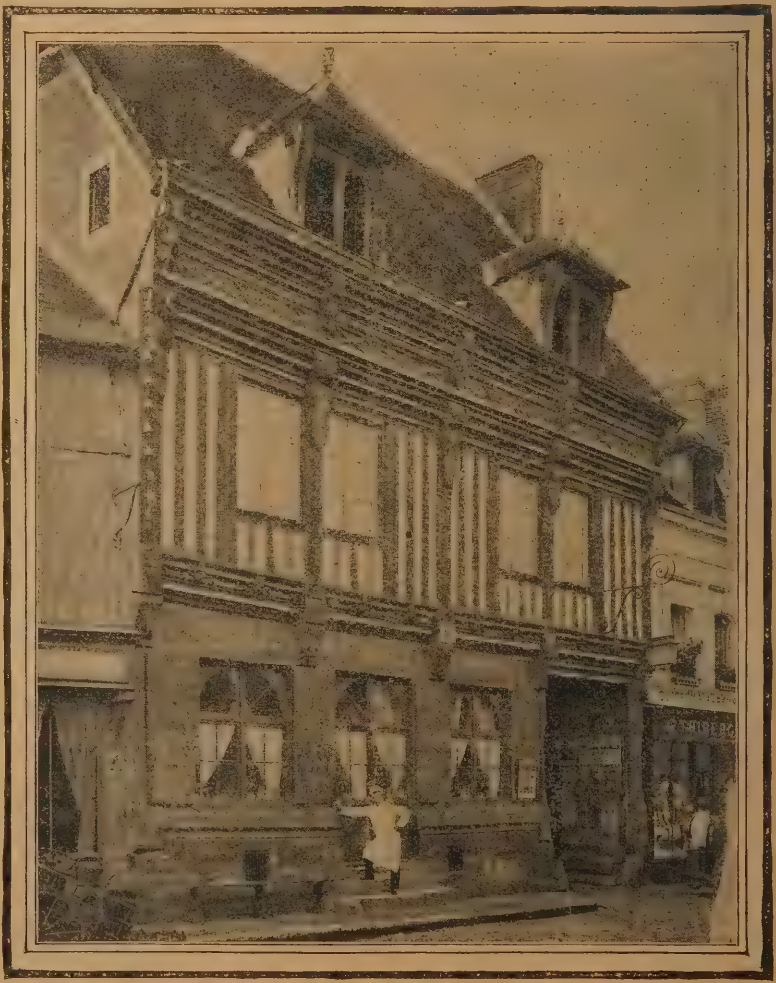

FIG. 8.—WOODEN HOUSES AT LES ANDELYS.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Lead Flat, Protection of Walls from Damp, and Hanging Sashes.

HARRINGAY.—W. A. B. writes: "(1) I have a flat to construct about 40ft. by 40ft., to be covered with lead, but I want the rooms under it to be cool. Which would be the best method of obtaining this? I thought of putting joists on and boarding, and then putting smaller joists on top leaving a 3in. cavity between, and then boarding again and covering with felt. (2) I am putting up a house in an exposed position and do not want to use hollow walls. Should I plug and batten the outer walls and then lath and plaster in the usual way? If so, what sizes should the timbers and the cavity be and what distance apart? (3) I have some sashes (double hung) 2ft. wide by 7ft. 6in. high (total from stone sill to soffit). Would sufficient room in the frames be obtained with stone mullions 5in. wide for both the lights to be hung if I used lead weights, or should I have to make them larger?"

(1) Your plan is a good one. The cavity should be ventilated and slag wool would be an effectual preventive of vermin. (2) Yes. The battens used are 2½in. by ¾in. or 2½in. by 1in. They should not be less in thickness, as a ⅜in. cavity at least should be left. The battens are nailed to the plugs and spaced a foot or less apart; a greater distance is not advisable on account of weakness. The laths are spaced about ⅜in. apart. Lath and half laths should be used for walls subject to rough usage, and single laths for ordinary walls. Battened walls harbour vermin, their woodwork is likely to decay, and they are in danger of fire. The bottom lath should be left off till the last and the wall plastered from the top downwards so as to allow the plaster that falls through the laths to have a free passage and not lodge on any of the protuberances inside the cavity from plaster below or at the bottom of the wall, as this will lead damp through. Metal lathing is now much used and has advantages. Vertical tiling is superior to plastering. (3) You do not assist us to give you a correct answer; the details you give are meagre and ambiguous, and the weights of the sashes, a most important consideration, are not stated. A space 5in. wide by about 5in. deep is exceedingly small for four weights to hang in, and therefore every fraction of an inch must be studied. You cannot have stiles less than ⅞in. thick, and the centre lining must be kept as thin as possible, say ⅛in. This will allow room for a square lead weight about 2in. by 1½in. and about 12in. long. In this we are working upon the assumption that the glass will not be heavier than 21oz. sheet. If plate glass is required, "patent" had better be used to reduce the weight. If this is done you will have sufficient room by using lead weights, as you can counterbalance a sash up to 30lbs. weight without having the weights too long to enable them to work. We assume that the sashes are about 3ft. 6in. by 2ft. each.

"New" Buildings and Rights of Lights.

DULVERSTON.—EXE writes: "Two houses have been purchased by private subscription and pulled down. That part of the site denoted by the dotted lines on the enclosed sketch (not reproduced) has been thrown into the street, and the part shown by the firm lines is now for sale. (1) Would a house erected on the site be a 'new domestic building' within the meaning of the by-laws, of which I send a copy; and (2) how long is a right of light retained after a building to which that right belonged is demolished?"

(1) Yes, it would be a new building within the meaning of the by-laws. (2) To maintain any "ancient lights" or rights of light which have been acquired by prescription, care should be taken before pulling down the building that detailed drawings, with full particulars relating to the size and exact situation of the "ancient lights," are properly prepared, signed and verified, or the old windows should be temporarily maintained in their original position. If the building has been pulled down and no duly authenticated records kept of any presciptive rights of light which were previously obtained, it would appear they have been voluntarily relinquished, so that any attempt now made to restore them more or less approximately might be successfully disputed.

T. E. C.

Rainwater Tanks.

NORWICH.—C. B. writes: "I have just completed a rainwater tank, of about 5,000 gallons capacity and 6ft. deep, in a boggy soil partly under water. The walls consist of Fletton bricks laid in Francis & Co.'s Portland cement and pugged round with 12in. of gault. The walls were then rendered, which rendering remained perfectly sound for about a month, since when it has left the walls in pieces varying in size from 1ft. to 6ft. super. Can you suggest a remedy?"

The chief reason is doubtless that the cement rendering had not a sufficient key to hold it on. Fletton bricks are comparatively smooth, and might with advantage have their faces scoured, but the most important consideration is that the joints should be raked out before rendering; the smooth flushed joints in cement gave no hold. The want of key would be aggravated by the bricks not being thoroughly wetted before rendering to prevent the water being abstracted from the cement.

Books on Repoussé Work.

INGATESTONE.—R. H. B. writes: "Where can I obtain a cheap book on the rudiments of repoussé work in copper or brass?"

Gawthorp's "Art of Brass Repoussé for Amateurs," price 1s. (B. T. Batsford), and "Repoussé and Metal Chasing," by C. G. Leland, 6d. (Dawbarn & Ward, 6, Farringdon Avenue, E.C.), are the only books we know of on this subject.

Discoloured Plastering on Walls.

NORWICH.—E. P. R. writes: "Which is the best way to treat a newly-plastered (internal) wall on which the plaster is much discoloured, apparently by the bricks? Neither paint nor ordinary colour will cover the defect."

The discoloration may be due to several causes, but we should hardly blame the bricks. It may be caused either by the composition of the backing or of the setting coat, by the floating having been brought up in one coat, or because there was insufficient thickness in the coats. Two or more of these may have united in discolouring the surface. The only remedy is to replaster, using good materials and in three coats—described as render, float and set.

Charges for Quantities and Supervision.

TODMORDEN.—NEMO writes: "I agreed with a working joiner to build four houses. He was to buy some plans (that had already been drawn) from an architect who is also the agent for the land. The joiner was also to get out the quantities for the materials required, which he could easily do by simply doubling the quantities of two houses he had previously built. He has added 1½ per cent. for the quantities on to the cost of the houses and charged me £10 per house for his superintendence. Is this fair? The houses have cost £222 each."

We do not think, considering the circumstances, that the contractor is entitled to more than £5 per house for superintendence and £10 for the preparation of quantities and obtaining estimates.

Changing a Private House into a Shop.

SANDWICH.—D. E. R. A. writes: "I have a private house which I want to alter into a shop. My next-door neighbour has a small cellar which is built out into my basement, the ceiling being formed by my ground-floor joists. The wall forming the cellar has a wooden shutter, also a bond timber. As I wish to make this fireproof, and also to lower the ground floor about 9in., can I remove my joists and floor and put in a fireproof floor over the cellar (the underside would come about 2in. lower than the present ceiling), and should I have to give notice of my intention of doing this? Also, can I take out the wood shutter, &c., and fill in with brickwork? I might add that my neighbour is not on good terms with me."

The floor is virtually a party wall, and you should certainly give notice, more especially as we cannot see how you can avoid entering your neighbour's cellar and causing a nuisance in the replacing of the floor. As you are not on good terms, we should advise you to adopt some method by which you would avoid any interference with your neighbour's headroom: 2in. is not a great matter, after all. You must certainly get permission to alter the wood shutter, &c. Your neighbour might legitimately object to the opening being blocked up with brickwork, for we presume the two premises were originally intended to form one, and he may be desirous at some time or other of acquiring yours; but if he is at all reasonable he could hardly object to an iron door being put in.

The Specific Objects of these "Enquiries Answered."

KING'S NORTON.—F. E. T. writes asking us to give answers to examination questions dealing respectively with the safe weight to put on timber struts; plans and sections of cast-iron columns; and stanchions to carry given weights.

In reply we have to say that these columns are not intended for the purpose of answering questions set as exercises in books or in examinations, nor to save correspondents any little trouble they may experience in endeavouring to solve problems with which they have very little acquaintance; our object is to aid readers in real problems which may occur in the course of practice. At the same time, we are always willing to help any student over a rough road. Our correspondent can find all he needs in Rivington's "Building Construction" and Prof. Henry Adams's "Structural Ironwork" (price 7s.). The formulæ for calculating the sizes, &c., of struts, beams, &c., are given shortly and clearly, with tables of the values of the constants, in Hurst's "Architectural Surveyors' Handbook" (price 4s.).

An Architect's Liabilities.

ENQUIRER writes: "I have been carrying out some alterations for a public body, at a cost of about £400. Early in July I sent certificates in final settlement. The clerk did not call a meeting of the governing body till September; and although I asked him to allow me to attend the meeting, he sent me no notice. Since then he has requested me to produce a statement of account, vouchers and bills, which I have done. I may add that the bill of extras amounts to less than £10. I have given orders personally for special things, and have therefore made myself personally liable for them, and am now being pressed for payment. I have informed the clerk that I shall give no further information unless I can meet the whole governing body."

It is difficult to understand how you can be personally liable. If you have been acting as architect you were, *ipso facto*, entitled to order reasonable extras and variations, and the body for which you acted is bound to pay on your certificate. The only likely complication is that the contract may not be under the seal of the public body, in which case it may repudiate liability entirely; but then the contractor and not the architect would be the loser, the architect being no party to the contract. The best course to adopt seems to be to take up this position, leaving the contractor if necessary to issue a writ against the governing body upon your certificate, while repudiating personal liability yourself. If there are any other material facts, a local solicitor should be consulted, to whom the matter could be explained personally.

G. A. T. M.

Vandalic Restoration at Heidelberg.—The appearance of the castle has been quite spoilt by "restoration." Before, it was of sandstone that had turned a deep rich red with age. Now the old front has been taken out and the former stones faithfully copied, but the effect is like a house in the Champs Elysées newly built for a stockbroker, and copied from an old Renaissance house. From the river it looks like a mammoth *hotel de luxe*, for a blue slate roof and gilded cupolas have been put on it.

THE HOUSING PROBLEM.

CONFERENCE IN GLASGOW.

A CONFERENCE under the auspices of the Improvements Department of the Glasgow Corporation was held last week at Glasgow. The Lord Provost (Mr. Samuel Chisholm, LL D.) presided.

Preceptor Gray (Glasgow) read a paper giving suggestions as to the means of acquiring at the lowest possible cost the land necessary for the erection of cheap dwellings and obtaining the capital required for the purchase of the land and the erection of the buildings. He argued that municipalities should have power to call upon owners of slum property to clear the land of what he would call diseased property. Local authorities, when securing land for parks and other public purposes, should see that it was secured untrammelled with restrictions against building. On the border of our large towns there were tracts of land held by hereditary and other landowners who were waiting until the trade of the city increased the value ten- or twenty-fold. It was high time powers were obtained to force the necessary ground into the market.

Councillor Burt (Glasgow) followed with a plea for the taxation of land values.

Mr. A. B. M'Donald, city engineer, Glasgow, read a paper on the materials usable for, and the various feasible modes of construction in, the erection of suitable dwellings, and sketched out a scheme for a tenement of houses 60ft. in length and three storeys in height at a cost of £1,100, thus allowing them to rent houses of one room at 1s. per week. That would yield £78 per annum. The extent of ground required would be 630 sq. yds., including proportion of street ground in front. Writing off the rentals 25 per cent., and charging 3½ per cent. on the cost of erection, would allow 10s. the sq. yd. for the site. He stated that there were localities in Glasgow not far removed from industrial centres where land could be obtained for less than 10s. per sq. yd.

Councillor Walker (Leeds) suggested that municipalities should be allowed to pay a ground rent for the land instead of repaying it over a term of years; that instead of attempting to build according to the regulations of the Local Government Board they should be allowed to put up inexpensive buildings; and that they should extend the term of repayment over fifty or sixty years.

The best possible way to deal with unhealthy and congested areas from the point of view of economy, expediency and sanitation was dealt with by Councillor Holder (Hull) and Councillor Innes (Derby). The former urged that the demolition of insanitary areas should be taken under the second part of Part 2 of the Housing of the Working Classes Act. He pointed out that Part 1, which dealt with large areas, was very costly; but Part 2, which dealt with one house at a time, entailed little expense, and the work could be carried out with expedition, advantage and economy. Mr. Holder, in reply to a question as to what Hull did for the people displaced by the operations of the Act, said a private company erected houses of four rooms, which they let for 3s. 9d. per week or offered for sale at £130 freehold. The price of the land was 10s. per sq. yd. The houses were in some cases less than a mile from the centre of the city. There was no ground rent, and being operated by a private company the scheme was not harassed by preliminary objections raised by the Local Government Board, as would be the case were it carried out by the Corporation. It had been found of great utility for the housing of those persons displaced by the operations of the Hull city improvement scheme.

Mr. Peter Fyfe, chief sanitary inspector of Glasgow, read a paper on "Farmed Outhouses: Should Municipal Authorities provide them?" and he took the view that municipalities should not supply furnished houses on the ground that only a limited number of the sub-tenants were victims of circumstances not of their own making. The remedy, he held, was the annihilation of the unrestricted use of public-houses and lower class pawnshops.

A resolution was adopted that further and immediate general or private Bill legislation was necessary and expedient in the directions following: (*a*) That simpler and less costly machinery should be devised and sanctioned by Parliament for enabling local authorities to put in force and carry out the provisions of the Housing of the Working Classes Acts; (*b*) that authority should be given to municipal corporations and other local authorities to acquire at its market value, by as simple and inexpensive a method as possible, and without any allowance for compulsory purchase, land for the present or prospective erection and maintenance of dwellings for the population to be displaced by the abolition of slum properties; (*c*) that any sinking fund required to be set apart for repayment of moneys borrowed for such purposes should apply to the cost of buildings only, and not to land, and should be extended over a period of not less than sixty years; and (*d*) that municipal corporations and other local authorities be empowered to build such buildings in accordance with their own by-laws and not be required to satisfy the requirements of the Local Government Board.

Builders' Notes.

Disclosure of Tenders.—At the recent monthly meeting of the Norton (Malton) Urban District Council letters were read from Messrs. A. Lyons & T. Anderson, builders, of Norton, who complained of the Council's action in rejecting their tenders for the erection of the public swimming bath because they were higher than the surveyor's estimate. Mr. Lyons alleged that the committee or the officials had disclosed the details of his tender to other tradesmen, which was a scandalous thing.

Leeds Glazed Bricks.—The manufacture of glazed bricks, which already ranks as an important Leeds industry, is steadily growing in importance. High-class bricks are now turned out in immense quantity at the Farnley Ironworks and other local seats of manufacture. Owing to the excessively refractory character of the Leeds clay, the hard glaze can be put on at a temperature much above that which most clays can stand, and as a consequence the glaze is of an exceptionally durable character. The employment of glazed bricks is constantly on the increase. Numerous large buildings, public and private, are being erected in Leeds at the present moment, in the masonry of which they will form a conspicuous feature, but London is the best market. Leeds bricks are exported in considerable quantity to France, Germany and other Continental countries, but their great weight makes the question of carriage prohibitive to places such as the colonies. Were Leeds a seaport the difficulty would be greatly lessened.

The "Canadian Trade Index" is the title of a useful publication which has been prepared by the secretary of the Canadian Manufacturers' Association, Toronto, for the use of British, French and Spanish importers. The "Index" contains the names of some 800 leading manufacturers of Canada, who have formed themselves into a voluntary association for the purpose of advancing the trading interests of the country. It also contains a brief sketch of the leading export manufactures of Canada. Then follows an alphabetical list of the members of the association, together with a limited list of the articles made by them. The third part contains an alphabetical list of the articles produced by the various members, under which appear the names of the manufacturers of each. The names of the articles are given in English, French and Spanish. Mr. W. D. Scott, Commissioner of the Canadian section, Glasgow Exhibition, will be glad to furnish a copy of this book free of charge to merchants interested in Canadian manufactures, and also offers to answer any enquiries relative to goods that may not be specified in this publication.

Encroaching on Regent's Park.—Lord Howard de Walden has laid a proposal before the London County Council and the Marylebone Borough Council which, it is stated, if carried out will involve a serious diminution of the air and space on the north side of Regent's Park. His lordship is improving that portion of his estate called Portland Town, which abuts on the north-west side of Regent's Park. He asks to be allowed to advance the building line on the fore-courts in Albert Road from High Street (St. John's Wood) to Culworth Street to an extent varying from 10ft. to 26ft. on an average of 15ft., and it is understood that, should this be granted, a further demand will be made to continue the encroachment for a long distance further in the direction of Primrose Hill. The object in view is that there may be more room for the erection of blocks of residential flats in Albert Road overlooking Regent's Park. This scheme will take a large slice off the width of Albert Road, which, in its present state, is capable of being converted into a magnificent boulevard, and will cause a serious diminution of the amenities of the park. This proposal has unfortunately received the approval of the works committee of the Marylebone Borough Council. It is being vigorously opposed by a portion of the London County Council. It is a melancholy fact that notwithstanding the object-lesson we have had in the destruction of the beauty of Euston Road and Marylebone Road by encroachment on the forecourts, we should now have to defend another of our boulevards from the building speculator.

Masters and Men.

The Bricklayers and Labourers of Hinckley, Leicestershire, have asked their employers to be allowed to resume work on the old terms. On April 1st they came out for an advance in wages, and have remained on strike ever since.

The Strike of Painters in Salford, which took place in connection with the work at the Salford Car Shed recently, still continues. The contract for the painting of the shed was let to a couple of firms, one of whom, so the Union allege, employed unskilled workmen to do what might be termed rough work—work which the firm contend is not that which skilled men are called upon to perform. The Painters' Union, in the face of this, say that even if these men were receiving the standard rate of wages fixed by the union, this firm would still be breaking the fair contracts' clause, the contention being that whether the work be rough or smooth it should be done by skilled painters.

The Strike of Builders' Labourers at Swansea has for twenty-one weeks been carried on with good feeling on both sides, but there are now indications that feelings other than pleasant are becoming pronounced. A considerable number of labourers have been brought to the town, but strikers are said to have got at many of them, and the feeling of some of the employers is that this has been brought about by illegal methods. The employers declare that if the labourers who offer their services are much further interfered with they will bring to a close all work now going on in Swansea until next spring. This, of course, would mean the locking out of masons, carpenters, and practically all engaged in the Swansea building trade for the whole of the winter. They also have issued an intimation that if the builders' labourers persist in picketing they will apply for an injunction and also claim damages under the recent Taff Vale picketing case decision. The strike has cost the union £1,800, and the masters have lost over £3,000.

Hull Slaters' Strike.—The Yorkshire District Branch of the National Association of Slate Merchants and Slaters held a meeting last week at Leeds to consider the Hull slaters' dispute. The operative slaters of Hull, who are members of the Yorkshire Division of the Slaters' and Tilers' Amalgamation, have been on strike for five weeks against a code of working rules recently agreed to between the employers and the operatives in Yorkshire, and have defied the authority of their Executive Committee. In consequence of the interference by the Hull Operative Building Trades' Federation, the Hull employers, who so far have taken a neutral position in the struggle, appealed to the Yorkshire employers for advice. It appears that rule 8—the one with regard to labourers, and which the Hull men declared to be the bone of contention—was submitted by the operatives themselves and was struck out of the code by the masters at the first conference between the employers and the operatives. At the second conference the operatives insisted on the rule being reinstated, and after a discussion the masters gave way on the point. Thus it would be seen that the rule in question, and upon which the dispute now largely rested, was forced upon the employers against their desire. The meeting was unanimous in its determination to support the action of the Hull employers. Amongst the resolutions passed were the following: (*a*) That this meeting regrets and condemns the action of the Hull branch of the Yorkshire District of the Operatives' Amalgamation, and hereby pledges the Yorkshire employers to "back-up" and assist in every possible way—both morally and financially—the Hull members of the association in securing the due observance of the new code of working rules. (*b*) That a fund be raised for defraying the expenses that may be incurred in connection with the Hull slaters' strike, and that, as a first instalment to such fund, a levy be now made of 10s. per man for each operative slater employed by the slating and tiling contractors of Yorkshire; and that application be made to the National Association of Slate Merchants and Slaters for the interim grant of £260 from its "emergency" fund. (*c*) That the hon. secretary be instructed to advertise for unionist slaters at the standard wages of the city and that, in addition, the Hull employers be authorised to give approved workmen a substantial bonus until the termination of the dispute.

New Patents.

These patents are open to opposition until November 4th.

1900.—Sewage Wagons.—15,781. W. Defries, 147, Houndsditch, and V. I. Feeny, 60, Queen Victoria Street, London. This invention relates to sewage wagons which consist of wheeled tanks into which the sewage is lifted by means of a vacuum. Offence may be caused by such wagons becoming full without the operator being aware of the fact. To prevent this a floating indicator in a glass dome is provided, which shows when a given level has been reached.

Closing Apparatus for Lift Doors.—16,962. A. C. Moffatt, 32, Green Street, Blackfriars, London. In the well-hole at each floor-level there are two chain-wheels having projecting arms. These wheels are connected with a shaft from which the door (in two halves) is suspended. When the lift approaches the opening it rotates the chain-wheels and so closes the door.

Girders.—17,428. H. J. Armstrong, Markdale, Grey, Ontario, Canada. Each end of the beam (say of H-section) is strengthened by struts reaching from the web to the edge of the flange, while a tube (riveted on) curves from the bottom flange at one end to the top flange at the other end of the girder.

Cutting Glass.—18,183. S. Disselkoen, 78, Amsteldjik, Amsterdam. The glass is cut by means of a ribbon or wire driven like a band-saw, and fed with corundum powder mixed with oil.

Water-Closets.—19,420. N. E. Cooke, Swadlincote, Burton-on-Trent. With water-closets made in two parts there is a tendency for the basin to tip up from the syphon part below. To overcome this a flange or rib is provided on the basin and a corresponding hook-shaped projection on the syphon.

Wood-Block Floors.—20,130. H. P. Clemetson, 9, North Street, Ashford, Kent. The blocks are held down by wires which pass through them in rows, clenched at the ends.

1901.—Centering for Fireproof Floors.—14,498. P. A. Newton, 6, Bream's Buildings, Chancery Lane, W.C. (*The New Jersey Wire Cloth Co.*, Trenton, Mercer, New Jersey, U.S.A.). The centering is supported by hangers during the construction of the floor and the setting of the concrete. These hangers pass over the tops of the beams, and are cut when the floor is set, thus releasing the centering.

The following specifications were published on Saturday last, and are open to opposition until November 11th. A summary of the more important of them will be given next week.

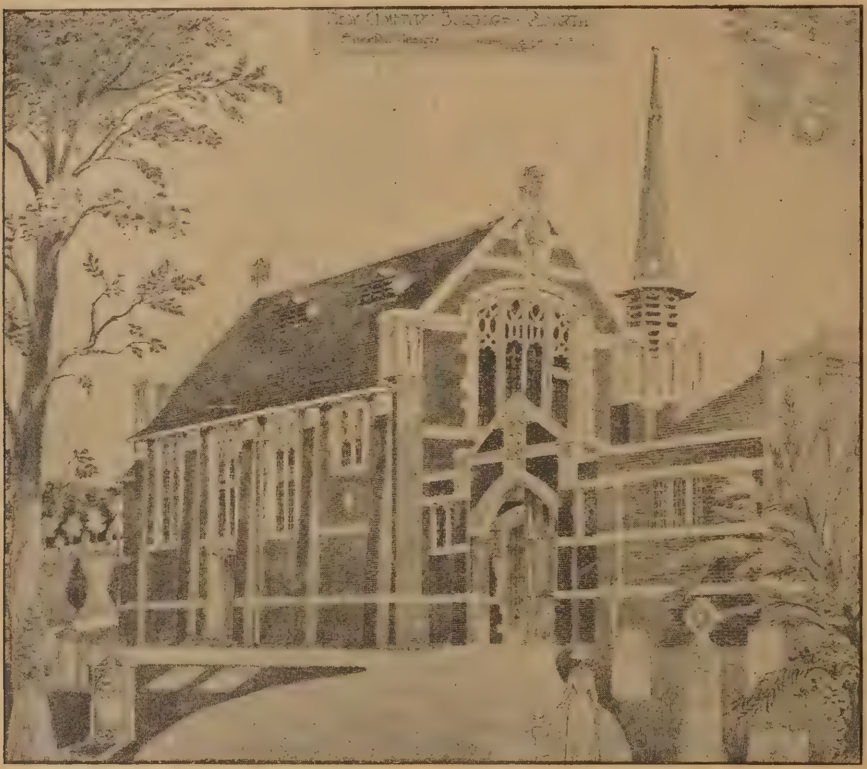
1900.—15,752, Hirst & Ide, electroliers and pendants. 16,004, Rawson & Littlefield, refractory bricks, furnace linings, &c. 16,019, Grimshaw, door-closing apparatus. 16,304, Roberts, kitchen ranges. 17,770, Forti, lighting and extinguishing distant gas burners. 18,583, Ridgway, apparatus for distributing sewage on to filter beds. 18,673, Welsh, measuring and registering taps. 18,693, Friswell, refractory materials for building. 18,849, Matthews, tiles, surfacing slabs and blocks. 18,937, Brown & Brown, extensible ladders. 19,198, Wesselmann, lifting blocks. 19,220, Hirst & Collings, connections for electric-light pendants and other fittings. 19,548, Johnson, stiff-plastic brick moulding and pressing machines. 19,710, Phillips, reversible windows. 19,881, Easily Cleaned Window Co., Ltd. & Grinnall, revolving sashes. 20,032, Scott, heating apparatus.

1901.—903, Adams, syphonic discharge apparatus. 8,129, Schill & Primrose, apparatus for the manufacture of gas. 14,309, Mallory, door-holders. 14,581, Harry & Harry, tanks in detachable parts. 14,683, Smith, strainers for paint. 14,831, Freckmann, cement slabs for ceilings. 15,008, Smith, door-hangers. 15,855, Hefrwagen, interior decorations.

Law Cases.

An Oldham Builder's Failure.—At the Oldham County Court last week the public examination in bankruptcy took place of William Wood, joiner and builder, of the Watersheddings Saw Mills, Oldham, who had been adjudicated bankrupt on a creditor's petition. The liabilities were £1,418 5s. 6d., and the assets £149 5s., leaving a deficiency of £1,269 0s. 6d. He attributed his failure to want of capital and losses on speculation. The examination was adjourned.

Unprofitable Hotel Building.—At the London Bankruptcy Court a receiving order was recently made against F. Dudley Hayward, contractor and engineer, of Gracechurch Street, E.C. It appears that the debtor, who started in business about four years ago, has been principally engaged in building hotels. Amongst others, he contracted to build the Oban Palace Hotel, over which he estimates he lost about £10,000. He also contracted to build the Metropole Hotel, Southend, under which contract he was financed to the extent of over £300,000. He mortgaged the building to the financiers, who eventually foreclosed, and he attributes his failure to the stoppage of financial supply and to heavy law costs. He returns his liabilities at £310,000.



An Appeal relative to New Streets.—At the Surveyors' Institution, Westminster, on Friday last, the Tribunal of Appeal heard an appeal of Mr. H. W. Forster, M.P., against the refusal of the London County Council to pass certain plans for the construction of four streets on the appellant's estate near Catford, in the Lewisham district. The alleged ground of refusal was that the roads proposed did not afford direct communication between two roads laid out for carriage traffic; but it was alleged that the real ground was that the roads proposed did not afford communication with the adjoining Corbett estate, which was also being laid out for building. The court decided to allow the plans subject to Road No. 4 being laid out and completed before the other three roads were constructed, and allowed twenty-five guineas costs to the appellant.

A Road Contractor's Affairs.—At Henley last week George Herbert Robinson, of Endon, engineer and surveyor (also trading as Horobin & Co., at Cobridge, road contractor), came up for examination. The statement showed gross liabilities £2,865 5s. 9d., and estimated deficiency £2,326 10s. 6d. The debtor stated that he bought the business of a road contractor in 1898. He gave £600 for it, and in addition agreed to discharge a liability of £140 on a bill of exchange. He attributed his losses to contracts: on one contract at Burslem he lost £700 through the rise in the price of materials. He had been living at the rate of £300 per year. The Official Receiver (Mr. Thomas Bullock): So far as I can see from these papers you have not made £50 for the last three years. The examination was adjourned.

A Building Speculation which Ended in Bankruptcy.—The first meeting of creditors under the failure of C. G. Crowdon was held last week. The debtor, described as a builder of Westbourne Grove Wharf, Paddington, which business he started in 1899 with a capital of £100, has for five years been managing director of the Worcester Fire Clay and Blue Brick Co. His building operations were carried on at Edgware Road, Kilburn, and elsewhere. Three months ago he purchased for £15,000 about 12 acres of building land at Maidenhead. The money was raised on mortgage, and he anticipated making a substantial profit out of it. The failure was attributed to inability to let properties when completed, to excessive law costs and interest on borrowed money. The debtor returns his unsecured debts at £1,500, and states that he has shares and debentures in the Worcester Fire Clay Company which are charged, the value of which he returns at £3,000 over and above the charges. Proofs to the amount of £8,577 having been dealt with, the meeting was adjourned for three weeks with a view to a proposal being made to the creditors.

NEW CEMETERY CHAPEL, PENARTH.

THIS design by Mr. William H. Ashford, A.R.I.B.A., of Cardiff, was recently selected by the assessor, Mr. G. H. Oatley, F.R.I.B.A., in a local competition. The site of the new cemetery consists of about five acres of considerably inclined land situated on the south-west of the town and adjacent to the Lavernock Road. The proposed buildings will consist of a chapel accommodating 100 persons, with a vestry attached, a small organ gallery at the west end, and a bell turret (which also contains the staircase to the gallery), a mortuary with viewing room, and entrance lodge and gates. The conditions required that a narthex or covered shelter should be provided to accommodate a second funereal party, and that direct exits should be arranged on both sides of the chapel. The walls will be of local brick faced with red-pressed bricks, the dressings being of Corsham Down stone. The roofs will be of open timberwork covered with Welsh slates. Internally the walls will be finished with plasterwork and red pressed bricks. Clear-glass leaded lights will be used in the window openings and steel casements. The estimated cost is £3,000.

Engineering Notes.

The New Reading-room, Baths and Club at Tankersley is having the entire warming, ventilating and hot-water supply systems carried out by Messrs. John King, Ltd., engineers, of Liverpool.

Lady Binnie, the wife of Sir Alexander Binnie, the distinguished engineer, died last week. The deceased, who was a daughter of the late Dr. W. J. Eames, of Londonderry, was married to Sir Alexander in 1865.

The Portsmouth Electric Tramways, which are upwards of fourteen miles in length, were formally inaugurated last week. The contracts for relaying the lines, overhead wires and power station represent upwards of £280,000, and with the amount to be paid for the acquisition of the old system the Corporation has incurred an outlay of £600,000.

Hampstead Heath and Electric Railways.—The National Trust for places of historic interest or natural beauty has sent an appeal to the promoters of the Charing Cross, Euston and Hampstead Electric Railway suggesting the desirability of their adopting an alternative route to that under Hampstead Heath, as now proposed, when the consideration of their Bill is resumed by Parliament next session.

Electric Light in Stepney.—The London County Council has sanctioned the borrowing by the Stepney Borough Council of £29,507 for the purpose of completing the electric-light installation. The rate collectors have been instructed to deliver with the next demand notes for rates a circular setting forth the prices charged for current, and the advantages to be derived therefrom.

Electric Tramways in Surrey.—The London United Electric Tramways, Ltd., have given notice to local authorities in Surrey of their intention to apply for further extensions of their system of electric tramways in the county as follows: (1) A line from Epsom to Wimbledon, along the main Epsom Road through Ewell, Morden and Merton; (2) a line from Surbiton to Croydon, through Ewell, Cuddington, Cheam, Sutton and Carshalton; (3) a line from Epsom to Ewell; (4) a line from Hook to Leatherhead, through Chessington. One of the company's proposals is to lay a line to Epsom racecourse, and they have asked the Epsom District Council to determine whether such a line would be advantageous or not. The company promise that the fares shall be less than a halfpenny per mile and less than a quarter of that sum for the industrial classes between certain hours.

The Nottingham Midland Railway Bridge in Carrington Street is being reconstructed. The work is to be accomplished in two portions, and that part adjoining the station has been undertaken first. In order to facilitate the work and at the same time continue the section of the tramways from Wheeler Gate to Trent Bridge, the rails have been deviated slightly to the Queen's Walk side of the roadway. The greater part of the stone wall which continues the bridge in the direction of Queen's Road is being demolished, and in a very short time excavations will be commenced in preparation for the foundations of the new bridge. According to the specifications, the iron portion of the bridge which serves for passenger traffic is not to be interfered with at all, but the eight stone arches in continuation of that are to be entirely removed and steel girders are to be substituted. This will necessitate the raising of the bridge considerably; and the whole of Arkwright Street to Crocus Street will have to be taken up and levelled to maintain the same gradient as prevails at the present time. The work has been entrusted to Messrs. Kirk, Knight & Co., of Sleaford, and the official estimate is that the work of reconstruction will occupy twelve months.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Exactly in the degree in which you require your decoration to be wrought by able men, you diminish the extent and number of architectural works. Your business as an architect is to calculate only on the co-operation of inferior men, to think for them, and to indicate for some of them at least such expressions of your thoughts as the weakest capacity can comprehend and the feeblest hand can execute.—RUSKIN ("Stones of Venice," Vol. I.).

Our Plates. THE house at Warlingham, Surrey, occupies an elevated site with fine prospects on the garden front over the surrounding country. Strict limitation of cost has necessitated simplicity in the treatment and construction of the building and the employment of plain and easily-obtainable materials. The lower portion is faced with red bricks, the upper with rough-cast and bright red weathertiling, and the roofs are covered with dark-brown tiles. The use of stone has of necessity been avoided. The work has been carried out by Messrs. J. T. Ward, of Warlingham, under the directions of the architect, Mr. W. H. Atkin Berry (Kidner & Berry), of 23, Old Broad Street, E.C.—The house at Roehampton, of which Mr. A. J. Hardwick is the architect, has lately been completed at Nepean Road for Mr. T. D. McMeekin. It is carried out in red brick with Leatherhead tiles. The half-timber work is in deal left rough from the saw and stained down to a vandyke brown, and the porch and verandah are carried out in oak. A feature is made of the hall, the constructional woodwork of the ceiling being left revealed and rough-cast in between the joists. The ingle-fireplace, with a raised hearth, is finished in dull red Ruabon bricks and contains a specially-designed hammered-iron dog grate. It is panelled above the line of the mantelshelf and is lighted by two small leaded windows on either side. A rough-cast and half-timber frieze is carried around the hall, and the treatment of the entire woodwork is that of a black-brown, as against a dull green wall-covering up to the bottom of the frieze. The doors throughout are fitted with crossed garnett hinges and thumb latches of quaint design. The perspective is by Mr. Sydney Newcombe.—The houses on the Ditton Road, Surbiton, for Mr. E. R. Babbs, are carried in white rough-cast with "Excelsior" green slating. The outside woodwork is painted white, the external ironwork black, and the doors are painted green. The hall is so arranged as to form a small sitting-room, which is an advantage in a small house. The stairs have long tapering newels and are painted white. Upstairs there are four bedrooms and a bathroom. Mr. A. J. Hardwick, of Kingston-on-Thames, is the architect. The perspective is by Mr. Sydney Castle. Messrs. Kelsey & Sons, of Chessington, Surrey, are the contractors for both houses.

Technical Education. LAST week Lord Avebury laid the memorial stone of the new technical schools which are in course of erection at Southend-on-Sea. The buildings occupy a central site at the junction of London Road and Victoria Avenue, and the accommodation will comprise a large lecture-hall capable of seating 400 persons, physics and chemical laboratories and demonstration-rooms, as well as ordinary classrooms and a very complete art school. The estimated cost of erecting, equipping and furnishing the new schools is £19,000, exclusive of the site, which forms part of the land belonging to the Corporation. Mr. Henry T. Hare, F.R.I.B.A., is the architect. After the ceremony Lord Avebury made a speech. He said that of all the great discoveries for which the last century was remarkable he should say that the most significant was as to the importance of education. If there was to be progress in the human race it must be by means of a sound and good education, not only of our children, but also of those who were grown up. It was only by observation and by experiment that they could determine facts. He confessed he was not satisfied that their system of education was as yet ideal. It was still, he thought, too narrow and too bookish. Education should be moral and religious, useful and practical, interesting and inspiring. Every child should have a good grounding in Nature knowledge, and specialising should not begin too early. The present education or rather half education was not the fault of the preparatory schools. Older universities and the great public schools must bear the responsibility. Out of 10,000 hours of study at the public schools only 300 were devoted to science. A great deal was heard about the loss of our commercial position, and especially about the great strides made by Germany. He saw no reason for discouragement, but was profoundly convinced that we could not expect to hold our own unless our system of education was greatly modified. What had technical instruction done for Germany? There were some interesting figures in the diplomatic and consular reports issued by the Foreign Office, especially in those of Consul General Oppenheimer, Consul-General Schwabach, and more particularly in that of Dr. Rose, of Stuttgart. Leibig's discovery, as it might fairly be called, of superphosphate of lime had created a great industry. In 1867 the production was 1,000 tons, while in 1899 it was no less than 750,000. The value of the organic dyes made in Germany in 1898 was no less than £6,000,000. The German dye-works employed about 20,000 men and over 500 academically-trained chemists, several millions of capital, and were very profitable. The cost of vaseline had been reduced from £350 per kilo to £6, and the export of essential oils amounted to over £100,000. Germany now exported of soluble glass 6,000 tons; of ultramarine, 3,000 tons; of oils, 70,000 tons; and of white lead, £218,000 worth. Taken altogether, the chemical industries, without sugar, reached a value of over £50,000,000. It was evident, then, that the technical instruction of Germany had been a very remunerative investment. In the first instance, no doubt, it was a great national advantage, but it was a boon also to the world as a whole.

Of Stonehenge. SOME rather hasty guesses have already been hazarded about Stonehenge, and a paragraph which can hardly be described as "inspired" mentions the famous stones in connection with the Stone Age. A book lately published, and written by Lady Antrobus, furnishes some very interesting particulars of the archæological history of Stonehenge. The first author who is considered to make unmistakable mention of Stonehenge is Henry of Huntington (twelfth century). He speaks of it as the second wonder in England and calls it Stanenges. Geoffrey of Monmouth and Giraldus Cambrensis wrote about it in the same century. But there is a supposititious mention of it more than 1700 years before these chroniclers. Hecatæus, the Milesian, who lived about 500 years B.C., mentions a great temple to Apollo, circular in form, which was built in the island of the Hyperboreans, "the fruitful island that stretches northwards of Gaul in the great ocean stream." Mr. E. S. Maskelyne inclines to the belief that the temple, a famous one, was built by the Phœnicians.

The Kaiser Objects. THE Kaiser has refused to sanction the erection of three ornamental fountains designed by Herr Hoffman, the Berlin city architect, for the Friedrichshain Park in the north-east of the city. The Kaiser has addressed a letter to the municipality explaining that he took the step on account of his artistic objection to the design. Models of the proposed fountains occupied a prominent place in the recent exhibition of Berlin modern architecture, and were there viewed by the Kaiser. The Jury of Arts had proposed a large gold medal for Herr Hoffman, but the Kaiser has only granted him a small one. In his Majesty's opinion the idea of the ornamentation of fountains illustrating well-known German fairy-tales is too garish and showy, and he proposes certain alterations which he desires to be carried out. The conflict between the Emperor and the city of Berlin over his Majesty's opposition to the construction of an electric railway over Unter den Linden is now about to enter upon another stage. Burgomaster Kirschner proposes to lay all the documents regarding the matter before the City Board of Aldermen. The "National Zeitung" states that his Majesty refuses to sanction the erection of several new city buildings, and a bridge

Surveying and Sanitary Notes.

Beckenham Street Improvements.—A Local Government Board enquiry was held recently into the application of the Beckenham Urban District Council for sanction to the raising of a loan of £5,740 for works of private street improvement. The four roads to be dealt with are Bromley Grove, Shortlands, Queen Anne Avenue, Warwick Road, and Church Road, Shortlands.

Open-Air Sanatoria, now becoming so generally popular in Europe, are said to owe their origin to Miss Florence, Nightingale. This notable woman first cured M. Benet, of Mentone, by advising him to pass the better part of his time out of doors, to reject medicines and to apply himself to a liberal diet. The first establishment devoted to the open-air cure was founded at Gœrbersdorff in 1859 by Hermann Brœhmer, though it was left to his disciple and pupil Dettweiler to perfect the theory in the course adopted in 1875 at the sanatorium of Falkenstein. There are now in the Valley of Davos about 3,000 patients and sixteen physicians.

The Westminster Paving Contracts.—At a meeting of the Westminster City Council held last week some discussion took place as to the recent contracts for paving certain thoroughfares in Westminster, notably Whitehall and Parliament Street, with American red-gum blocks. It arose on a notice of motion by Mr. Alderman Emden that the council of each Metropolitan borough, the Common Council of the City of London, and the London County Council should be invited to appoint one or two of their members and their engineer or surveyor to attend a conference, to be held at the Westminster Town Hall, for the purpose of considering the best materials and means of paving the streets of London. Eventually it was resolved to adjourn the consideration of the motion.

Do not Want Cheap Dwellings.—Residents of St. John's Wood have prepared a petition which is now being circulated for signature, and which will shortly be presented to the London County Council, to protest against the erection of workmen's dwellings in Grove-end Road. Briefly, the grounds for the objection are that it is opposed to every canon of decency to introduce into the heart of such a neighbourhood dwellings of so incongruous a character as those proposed to be erected; that the rental value of the properties will be greatly reduced and the sum total of the rates injuriously affected; and that workmen's dwellings mean overcrowding, the evils of which are obvious. It is also pointed out with emphasis that the proposed site is absolutely unsuitable for the housing of a dense population because it is a cul-de-sac, and that the danger at the time of a fire would be enormous. A public meeting of protest is to be held shortly.

Open Spaces in Fulham.—Another open space is about to be secured for the borough of Fulham, where building operations are in active progress, and as a result the population is rapidly increasing. The borough already contains three open spaces—Ellbrook Common, which is under the control of the County Council; Lillie Road recreation ground, and Bishop's Park. The recreation ground consists of 10 acres, and cost £20,000. Bishop's Park covers 15 acres and is well laid out. It has been determined to enlarge the park by acquiring 100 acres of meadow land which adjoins at a cost of about £16,000. A scheme has just been completed by the Fulham Borough Council to acquire a fourth open space which, unless seized at once, would soon have been in the hands of the builders. This site is in the Sands-end or eastern ward of the borough, near to Hurlingham Park. It consists of 22 acres, and has been purchased at a cost of £1,500 an acre from the owner, Miss Sullivan. At present it is under cultivation as market-gardens, and is known as the South Fields Estate. Including the laying-out, drainage, and other matters, the total cost will be £45,000, towards which the London County Council have agreed to contribute £30,000, leaving £15,000 to be borne by the local rates. It is expected that the new park will be thrown open to the public in about twelve months' time.

BUILDING CONSTRUCTION.

(Continued from p. 115 of No. 346.)

8. A STRAIGHT line can be used to represent a number; a line 6in. long will indicate the number 6 if we make 1in. our counter, or 48 if $\frac{1}{8}$in. is the counter, or 60 if $\frac{1}{10}$in. is the counter, or 96 if $\frac{1}{16}$in. is the counter, and so on. These numbers, like ordinary abstract numbers, may be used to indicate quantities of any kind, and arithmetical operations may be carried out on a drawing-board with sufficient accuracy for many purposes. (The student will find when he has made further progress that what are called graphic methods are of very great value in calculations far beyond the range of what we understand by "arithmetic"). By a "line" I mean a *straight* line. A line which represents a number may also define a direction, and if we mark it with an arrow head it may be made to show the course of motion or of a tendency, for some understood reason, to motion.

The line A B (Fig. 2) 2in. long may represent a force of 2lbs. pulling the point A in the direction A B, or, if we suppose the point at B to be the force, is pushing the point B.

If we put a knot on a string, and if two persons pull equally at the ends of the string, they apply equal and opposite forces to the knot. The student must be careful here to see that in this illustration no assumption is made as to the length of the string; we have not used the length of the string to indicate the amount of the force in lbs. If we make the force at one end of the string greater than at the other the knot will move in the direction or course of the greater force. If we tie a second string at the knot and pull at an angle to the first line of action, the knot will be pulled aside; and as long as the sum of any two of the three forces is greater than the third, the three lines of string will lie in one plane and they will settle in a definite position for each system of loading. It will be found that the forces are proportional to (may be represented by) the three sides of a triangle of which the angles are the supplements of the angles between the strings around the knot. If we know one of the forces, and if we have the angles between the strings, it is easy to find the other two forces.

For example, the point P (Fig. 3) is in equilibrium, and we know that one force is 14lbs. We draw the triangle 14, 12, 10, so that 14 is 14 units of some scale (say $\frac{1}{8}$in.), and having its sides parallel to the strings we can read the values 12 and 10 off the scale. It will be observed that the sense or *course* of the forces in the triangle is in sequence round the triangle.

FIG. 2

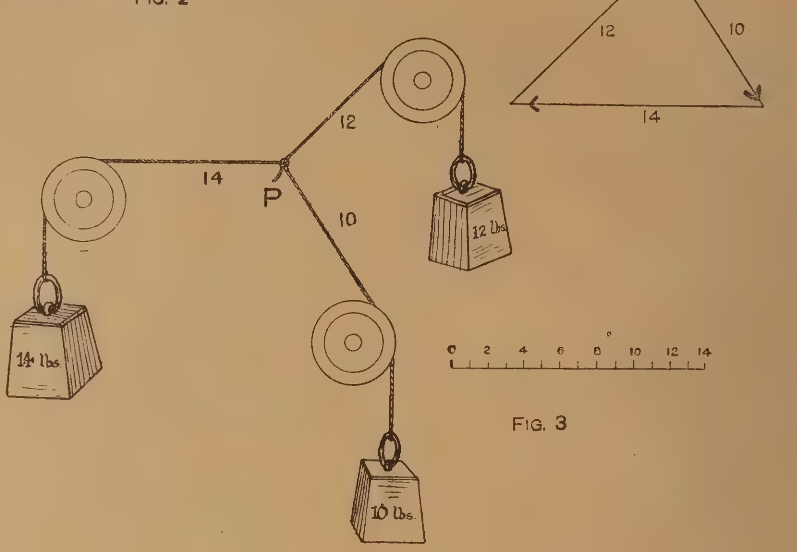


FIG. 3

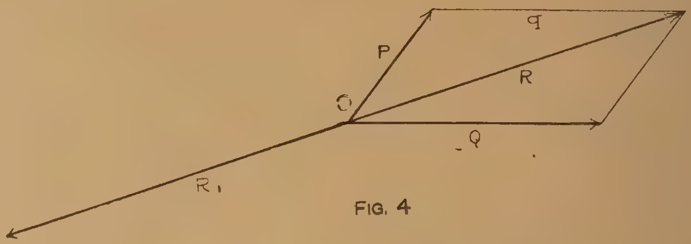

FIG. 4

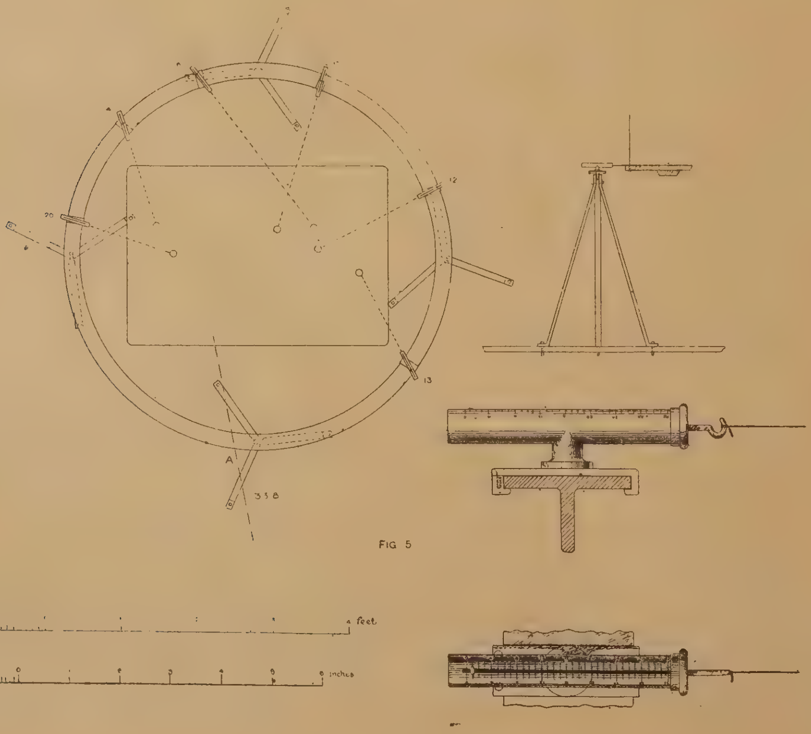

FIG 5

We have assumed the forces as pulling out from the knot or point. Our construction will also hold if the forces push in upon the point. This is known as the triangle of forces. It is practically the same thing as the parallelogram of forces. The apparatus which I describe further on will enable this and many other propositions of statics to be experimentally proved.

9. *The Parallelogram of Forces.*—If two forces are shown as P and Q (Fig. 4) acting at the point O, they may be replaced by a force R, represented in direction and magnitude by the diagonal of the parallelogram of which P and Q are conterminous sides. Suppose the three forces P, Q, R to be in equilibrium. A force equal and opposite to R may be put in place of P and Q, but the triangle P *q* R has its sides parallel and equal to P, Q and R; R and R′ are therefore equal and opposite forces. When two forces are replaced by the diagonal of the parallelogram formed upon them, they are said to be *compounded;* on the other hand, when a single force is replaced by two other forces (the sides of a parallelogram of which the first force is the diagonal) it is said to be *resolved.* We speak of the *composition* and the *resolution* of forces.

FORCES APPLIED TO STRUCTURES.

10. A piece of building material, as iron, wood, stone, &c., may be regarded as a rigid body when we are considering forces applied to it (which will not seriously destroy or break it) in reference to other bodies apart from it, and there will be no practical difficulty in regarding the same piece of material—or structure—as *not* a rigid body if our concern is with the stresses in its parts.

I have devised a piece of apparatus which may be used with advantage in experimentally proving much that it is necessary to know, and I hope to be able from its drawing and descriptions of its use to give clear ideas in regard to the application of forces in *one plane* to a rigid body.

The apparatus consists of an ordinary drawing-board suspended by four cords or fine wires from the ceiling, adjusted with reference to a horizontal ring on which spring balances of the kind shown may be adjusted at any part and at any angle to the centre line of the ring. The board may be subjected to slight displacement horizontally without appreciable effect from gravity, and it will behave as a rigid body acted upon by the forces shown on the spring balances. The balances may read ounces, and the connections to the board may be threads fastened with drawing pins; the amount of the force may be regulated when the thread is given a turn or two on the hook. The illustration (Fig. 5) shows forces of 20, 14, 6, 15, 12 and 13. It will be found that a force of 33·8 acting in the line A will balance these.

Fig. 6 shows how 33·8 may be arrived at by drawing. Making use of the parallelogram of forces: 20 and 14 are produced to meet and compounded, and they may be replaced by 31; 13 and 12 may be replaced by 18·5; 18·5 and 15 may be replaced by 26; 26 and 6 may be replaced by 22; and finally 22 and 31 may be replaced by 33·8; so that a force equal and opposite to 33·8 will balance all the forces acting on the drawing-board and will keep it at rest.

We know from Mechanics that if all the lines of direction of the forces met in a point, the polygon B would by its sides represent the forces. It will be found by experiment that, as shown by this drawing, the polygon B represents the balancing forces in amount and direction whether the lines of the forces intersect in a common point or not; but it does not show the line of the balancing force with reference to the drawing-board. It is manifest that we shall get the same polygon for any other set equal to these and having lines of action parallel to these lines.

The polygon method, then, will enable us to find the amount of the balancing force and its direction, but it will not enable us to determine its line on the drawing-board.

Our first construction determined 33·8 in amount, direction and position; and so far as this particular problem is concerned it is complete. It will, however, be found to be of advantage frequently for practical work to proceed by the polygon method.

The line 20 is drawn parallel to the force 20, and it is made of the length of 20 divisions of some scale; 14, 6, 15, 12 and 13 are drawn in the same way, and we find as the balancing force 33·8. It will be found if we apply this force by means of our apparatus at random we shall subject the drawing-board to a twist: we have what is called a "couple." The resultant of all the forces pulling in one direction and the equal balancing force pulling in the opposite direction, but not in the same line, will twist the drawing-board till these equal and opposite forces are in one line and balance.

Fig. 7 shows one way of locating 33·8. We begin with 20 and balance it with two forces 1 and 2, and we draw the triangle of these three forces as 1, 20, 2 (remember that the lengths of 1 and 2 as drawn on the rigid body bear no relation to the amounts of these forces). In like manner we draw 2, 14, 3 and 3, 6, 4, &c. Proceeding in this way we get 7, which must intersect 1 in the line of 33·8, and now we have a point on a line and the direction of the line, so that the line 33·8 is determined.

It may be observed that, owing to each pair of triangles having a common side, the lines 1, 2, 3, &c., in connection with the polygon B have a common point, and from this circumstance it has been called "a polar" or "the polar." This name may be of use in marking a step in a common operation where one is following a card without quite knowing why. Name or no name, I think it well for the student to see how the peculiarity naturally occurs. If he does he will not require a special name for it, and this will give, as far as he is concerned, some respite to a much-put-upon word.

If we turn again to the figure inside the ring shown by the dotted lines 1, 2, 3, &c., we may suppose it to be formed of a piece of string (or rope) having a knot at each angle, to which the several forces are attached. The drawing-board is now relieved from all stress, and the forces are all employed in stressing the string; from this idea of a string this dotted polygon is called "the funicular." Again, I think the student should, whether he uses the name or not, be independent of it. 1, 2, 3, &c., will answer if they are rods rather better than as strings, because rods will not give any suggestion of sag; indeed, in the usual cases which occur in practice the sides of the funicular which answer to 1 and 7 are not in tension, and string will not serve for these sides. Further, if we reverse the *courses* of the forces, rods will bear compression stresses.

11. *Couples.*—If the board is subjected to two equal and opposite forces which are not in the same line it is said to be subjected to a *couple*, or twist. The couple 15 (Fig. 8) gives a twist in the direction of the hands of a watch about a centre A. Now it is not obvious from mere inspection that an equal and opposite twist given by 10·125 about B will balance the couple 15, but the apparatus will at once show that this is so. Moreover, it will be seen that the forces 15, 10·125, 15 and 10·125 may be dealt with as forces acting on the drawing-board without any question of couples, and they will be found to exactly balance.

12. *Parallel Forces.*—When it is said that the point of application of a force may be transferred to any point in its line of action it is assumed that the force is applied to a rigid body and that the line of action lies on or through

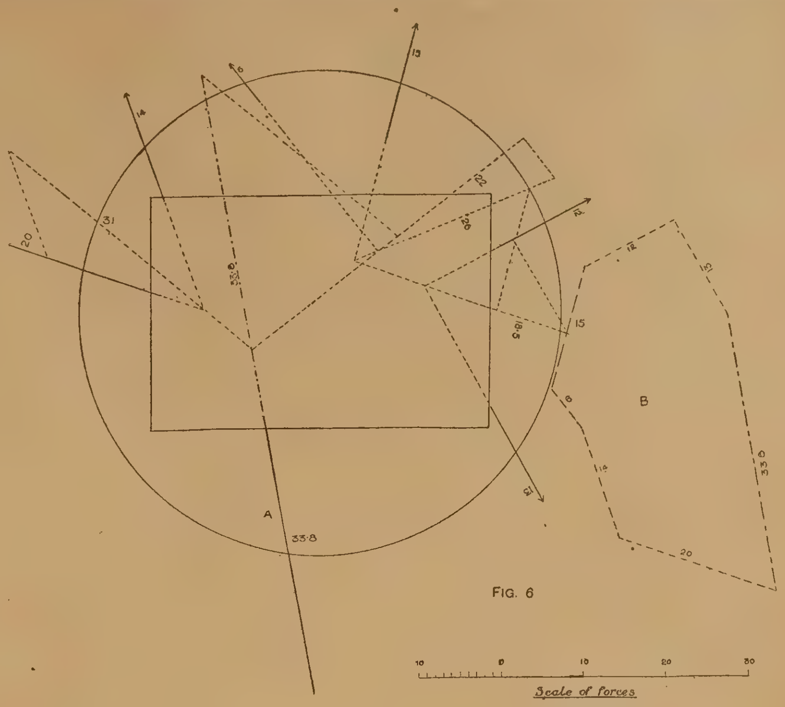

FIG. 6

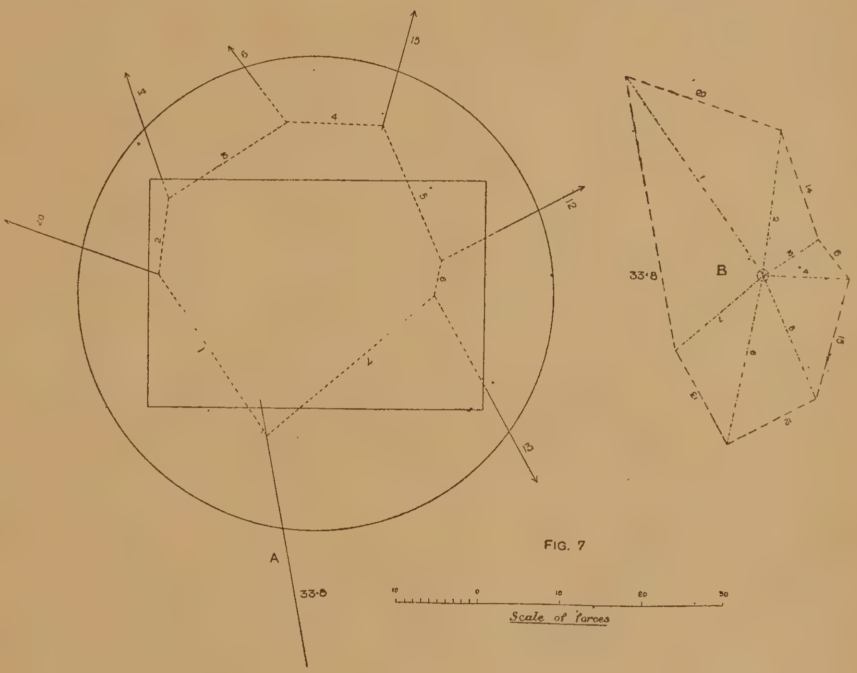

FIG. 7

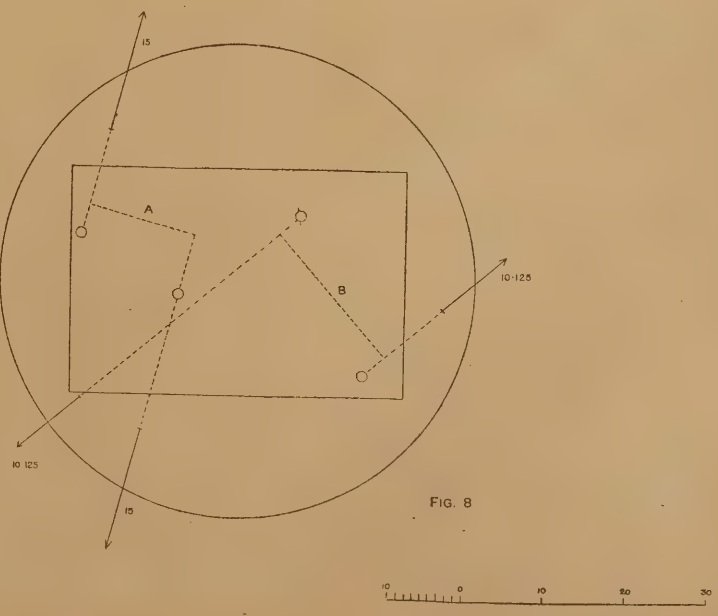

FIG. 8

the body. Two forces in the same plane inclined to one another may be connected to the point where their lines of action intersect by strings or rods, and they may be supposed to act at this point, where they may be balanced by a force equal and opposite to their resultant, as shown in Fig. 4.

Parallel forces can only be made the subject of investigation when we consider them as applied to a rigid body of sensible dimensions, and their relations can be shown by the apparatus.

If we have a piece of wood A B (Fig. 9) pulled west by parallel forces 4 and 6, a force of 10 pulling east will balance 4 and 6 (*i.e.*, keep A B at rest) if A X = 6 and B X = 4, or any multiples of these numbers. It will be seen on inspection that the above example of parallel forces may be also looked upon as a case of the balance of two equal and opposite couples 4 and 4, and 6 and 6.

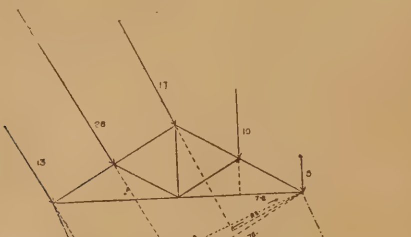

FIG. 12

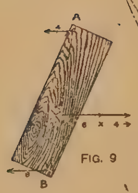

FIG. 9

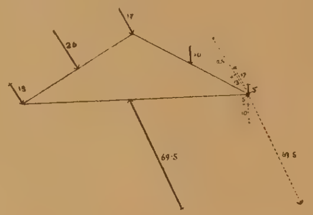

FIG. 10

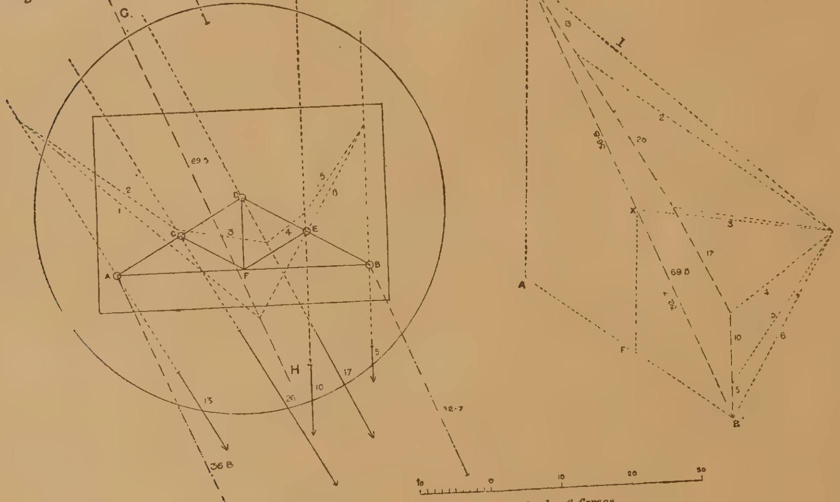

FIG. 11

Every case of parallel forces may be dealt with as an example of couples.

13. *Taking Moments.*—What is called taking moments about a point, where several forces are applied to a rigid body, is of frequent use in calculations, and it is well to have clear ideas of what is assumed. A rigid body at rest under any combination of applied forces may be conceived to be at rest under a combination of couples, of which one set of forces are the forces applied to the body and the other set of equal forces are applied to the body at any point whatever (see Fig. 10).

14. *Centre of Parallel Forces.*—From Fig. 9 it will be seen that in whatever direction 4 and 6 are turned the point X is invariable. If there be any number of parallel forces applied at definite points of a rigid body, they may be compounded, taking two at a time, and we shall obtain half the number of new definite points. This being repeated a sufficient number of times, we ultimately come to one definite point which is invariable whatever may be the direction of the parallel forces. This point is the centre of the particular system of parallel forces.

Centre of Gravity.—A body may be supposed to consist of a great number of particles held together in some way. The weight of each particle may be considered as a force applied to the body. The direction of all these forces is the same, and they have an invariable centre in whatever way the body may be turned. This point is the centre of gravity of the body. The centre of gravity of a body is not necessarily a point attached to the material of the body. When we speak of the centre of gravity of a line we mean that of a fine piece of wire of the shape of the line—curved or straight. The centre of gravity of a surface is the centre of gravity of a very thin plate or shell of the shape of the surface. When a body is suspended from a point by a string, the suspending string produced passes through its centre of gravity; if again suspended from a different point where this second line intersects, the first line is the centre of gravity of the body.

The centre of gravity of a triangle is the point where the medians intersect; of a sphere, in the centre; of the surface of a sphere, in the centre of the sphere; of a cone or pyramid, in the line joining the vertix to the *c* of *g* of surface of base, one-fourth of its length up from the base; of a hemisphere, $\frac{5}{8}$ of the radius of the sphere measured from the centre (at right angles to the great circle).

The student will require to know the centres of gravity of many surfaces, lines and solids for calculations of various kinds as we proceed.

15. Fig. 11 shows a centre-line drawing of a model king-post roof-truss. The truss is loaded at A, C, D, E and B with loads of 13, 26, 17, 10 and 5 cwt. Find the reactions at the abutments A and B.

(*a*) We may proceed as in Fig. 6, and find the resultant of the forces applied to the truss considered as a rigid body; and if we determine that the reactions shall be parallel forces, we shall make them parallel to this force and resolve this force into parallel components at the points A and B.

(*b*) Fig. 11 shows the usual mode of working this problem. The polygon 13, 26, 17, 10, 5, 69·5 is drawn; the triangles 13, 1, 2; 26, 2, 3; 17, 3, 4; 10, 4, 5; 5, 5, 6 are drawn, and the forces are transferred from the truss to what is called the funicular 1, 2, 3, 4, 5, 6. The resultant, which has been found to be 69·5 cwt., is found to lie in the direction G H, cutting A B at F. If Y B' is cut at X so that $\frac{YX}{XB'} = \frac{F'B'}{F'A}$ the reaction at A is represented in amount by Y X and that at B by X B'.

(*c*) The polygon 13, 26, 17, 10, 5, 69·5 gives the direction. We may obtain the amount of the reaction by taking moments about the point B. Draw perpendiculars to the directions of loads from B, measure the length of these, multiply these lengths by the loads, and divide the sum of the products by the length of the perpendicular from B or A (drawn parallel to Y B'). The quotient should be Y X (Fig. 12).

I have assumed that the reactions at A and B shall be parallel forces, but this is not a necessary assumption. Having got the resultant of the loads on the truss, it may be resolved into two forces whose lines of direction pass through A and B in an infinite number of ways. If either side wall provides in a special way for resistance to what is called the horizontal component of 69·5, it may be all put on this wall, and we may assume that the other wall bears only a vertical load.

(*Note.*—When a force is resolved into two other forces at right angles to one another, in whose plane the original force lies, each of these new forces is *the* resolved part of the original force in that direction.)

Of the three ways above described I may remark:—

(*a*) In practical work the applied forces usually do not intersect within reasonable limits, and compounding in this way under such conditions is tedious.

(*b*) This is the usual method. It is a continuously graphic method.

(*c*) Is probably the best general-purposes practical method. Graphics are good, and all kinds of graphical exercises are useful to the student, but in practical work it is not advisable to take a roundabout graphic way to avoid the ordinary multiplication and division of small numbers. Fig. 12 shows the problem worked by the third method.

[Note to section 5 (p. 115 of our last issue): $v = 2\frac{s}{t}$. (*a*) If a body falls from rest for *one* second the distance through which it falls is 16ft., and its velocity is 32ft. per second: its *average* velocity V in this case is $\frac{v}{2} = 16$. (*b*) If the time is *two* seconds the distance is 64ft. and the velocity is 64ft. per second. V is 32ft. per second. (*c*) If the time is *three* seconds the distance is 144ft., and V is 96, and so on. The equation $s = vt$ should be $s = Vt$. The word "often" should be "after."]

(*To be continued.*)

ST. SWITHUN'S, SOUTHSEA.

THE new Roman Catholic Church of St. Mary and St. Swithun, Saxe-Weimar Road, Southsea, was opened yesterday. The building is in Early English style, from the designs of Canon Scales, of Basingstoke. The length, exclusive of chancel, is 90ft. by 49ft. wide, and the chancel is 35ft. by 28ft. There are two side chapels, one 11ft. by 16ft. and the other 11ft. by 14ft. One only of these is completed, and that has a carved altar, while stained-glass windows have also been given for it. The present altar in the chancel is only temporary, but a suitable one for the position would cost a considerable sum, and the other fittings are complete. The flooring is of Goddard's patent blocks. Another novelty is that the porch is of the Narthex type, the door opening direct into the church. Above this is a gallery for the choir, and the whole building will be fitted entirely with the electric light. Over the further door, adjoining the Chapel of the Sacred Heart, is carved the Sacred Heart, surrounded by a crown of thorns. There is seating accommodation for about 680, and the cost of the church when finished will have cost about £7,000. The builders are Goddard & Son, of Dorking, who have constructed over 100 churches and chapels in various parts of the country.

Keystones.

The Temple Church is under repair.

A New Church at Gosberton, Clough, Spalding, is proposed to be erected at a cost of £1,000.

Municipal Slaughter-houses at St. Ives formed the subject of a Local Government Board enquiry into the application of the Town Council to borrow £1,000.

The Repainting of the Tower Bridge, even under the most favourable circumstances, will not be finished before Christmas. Mr. A. H. Hinns is the contractor. Three coats are being applied, the final one representing two shades of green. The bascules are to be painted terra-cotta colour.

The Charles II. Memorial Stone at the entrance to Lee Lane, Bradpole, near Bridport, was unveiled last week on the 250th anniversary of the fugitive king's escape from Cromwell's troops by turning down the lane on the afternoon of September 23rd, 1651.

A Victoria Memorial at Chobham has been erected on Ship Hill in the shape of a Runic cross of unpolished Aberdeen granite on an ironstone base. The cross stands in a most prominent position, close to the highway, and from its site a magnificent view can be obtained. It has been placed on the bank of the old redoubt erected by the troops in 1853.

A Stained-Glass Window has been erected in Prittlewell Church, Essex, consisting of three lights. The subject is the Crucifixion, and the manner is fifteenth century, freely treated. The scene is viewed through an architectural screenwork of brilliant and silver white glass. The window was drawn by Mr. Percy Bacon, and executed in the studios of Messrs. Percy Bacon & Brothers, of Newman Street, London, who carved and painted the reredos.

A New Mission Church at Blackham, a hamlet in the parish of Withyham, in North-east Sussex, is being erected at a total cost—including the site, building and some of the fittings—of £1,256. The church will be dedicated to All Saints', and will consist of a nave and chancel with a stone bell turret. It is being built of stone from the Hackenden quarry at East Grinstead, with Bathstone dressings, prepared by Messrs. Jenner & Grynyer, of East Grinstead. The bricks used inside have all been made at Blackham. Mr. Charles Day, of Cowden, is the builder; and Mr. Lacy Ridge, F.R.I.B.A., the architect. The accommodation to be provided is for 156 persons.

A New United Methodist Free Church at Westcliff-on-Sea is being erected. It is designed in Late Perpendicular Gothic, freely treated, and is faced with red bricks externally, the dressings and tracery being of white Costessey work. The roof is covered with green slates. The main gable is flanked on the one side by a dwarf octagonal turret, and on the other by a bold square tower, the latter terminating in a spirelet of quaint design. The church is designed for future deep double-transepts, but these are at present only to be erected to a depth of a few feet. A large school and classrooms are provided for in the future. The present portion is being erected by Messrs. Battley, Sons & Holness, of 21, Old Kent Road, S.E., whose tender is for £2,124. The architects, whose designs were accepted in a recent competition, are Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, of 5, Clement's Inn, Strand, W.C.

A German Queen's Memorial.—The Kaiser intends to honour the memory of his mother, the late Empress Frederick, by erecting a monument to her in the most conspicuous place in Berlin, namely, at the entrance to Unter de Linden. His Majesty has also drafted a plan for laying-out a large open space just outside the Brandenburger Thor, where this monument will be raised, and beautifying it with fountains and garden plots at a total cost of some £16,000. This is part of the Kaiser's plan to increase the imposing effect of this quarter of the capital, which contains also the Reichstag buildings, the huge column perpetuating German victories over Danes, Austrians and French, and the celebrated Avenue of Victory, which his Majesty has adorned with the statues of his ancestors. Like these monuments, the new one to the Empress Frederick will be in white marble, and on either side of it will be the bust of a noted contemporary of her Majesty.

The Edinburgh Architectural Association has acquired new rooms, and the address in future will be 117, George Street, Edinburgh.

Mr. D. J. Roberts, who was for some years with Messrs. Grierson & Bellis, architects, Bangor, has just been appointed principal assistant architect to the Birmingham Tame and Rea Drainage Board.

A Grammar School for Girls at Framlingham is now being erected. In June of 1892 the committee obtained designs and plans for school buildings, together with a mistress's house; and the plans of Mr. Frank Brown, architect, of Ipswich, which were selected out of the sixteen different sets submitted, are those now being built from.

Hospital Extension at Salford.—The Salford Corporation have just added two new pavilions to the Ladywell Sanatorium at a cost of £20,000. The new structures are designed to accommodate eighty beds, and the rooms are in keeping with those in the old building, being spacious, airy and well appointed in every respect.

A New Church at Newton, Oystermouth, Mumbles, to be dedicated to St. Peter, is being erected. It is proposed to eventually seat 600 persons, but provision is now only being made for 400. The total cost will be about £6,000. The edifice will be situated in a growing district above Langland Bay. Mr. Bruce-Vaughan is the architect, and Mr. Howells (Cardiff) the contractor.

Visit of the Russian Theatre Safety Commission to London.—Count Suzer, the president of the Russian Theatre Safety Commission, is now on a visit to London enquiring into the effect of our regulations. He has inspected the new testing station of the British Fire-Prevention Committee, with a view of providing similar facilities for research at St. Petersburg under a scheme mooted in connection with the terrible fire losses which have occurred in Russia during recent years.

Another Vicar builds his School.—The Vicar-designate of St. Margaret's, Leeds (the Rev. A. H. Kelk) has, with the aid of shop assistants, clerks, joiners, bricklayers and general labourers, all members of his congregation, begun to build a school. More than a month ago they commenced to dig the foundations, involving the removal of about 100 tons of soil. Nearly every evening during August after the day's work was over a band of from ten to twenty or more were at work with pick, shovel and barrow, and they have now completed the necessary excavation, thus saving about £15. The plans, bricks and a four-light leaded window were all given free.

A New Infirmary at Retford has been opened in connection with the workhouse. The architect is Mr. W. Southall and the contractor Mr. C. Jones. The building, which was started sixteen months ago, has been erected at a cost of £4,000; it is built on the north side of the workhouse premises and extends for nearly 200ft. The whole of the buildings are of ordinary red wire-cut bricks and the roofs are of Bangor slates. There are three entrances—the main, and one for males and another for females. The old infirmary will be pulled down and the spaces laid out as gardens. A covered way will lead from the centre of the new building to the kitchens. The whole of the gas- and water-pipes are exposed to view, and made easily accessible in case of repairs.

The Shoreditch Technical Institute, under the management of the Technical Educational Board, commenced its third annual session last Monday evening. The special feature of the work is the practical instruction given in the cabinet-making, woodworking and building trades. There are practical classes for cabinet-makers, carvers, carpenters and joiners, upholsterers, plumbers, electrical fitters and instrument makers, electrical wiremen, plasterers, polishers, as well as classes for the study of the scientific principles which underlie the various trades and the practical drawing and mensuration needed in the workshop every day. A new departure has been made by the Technical Education Board in the establishment of a technical day school for boys who intend to become cabinet-makers, carpenters, joiners, shop-fitters, pattern-makers, turners, carvers or draughtsmen. The boys undergo a thorough training in the nature and use of tools, workshop drawing, arithmetic and mensuration, and in the usual English subjects.

New Premises in Connection with the Rhyl Intermediate (County) School have been opened.

The Worthing Corporation Electric Lighting Works, erected on the site of the old waterworks, were opened recently.

Another Queen Victoria Memorial.—Lord Ashton has given a cheque for £10,000, the estimated cost of the Queen Victoria memorial statue at Lancaster.

"Inglenook," Purley, Surrey.—We learn that the architect of this house, illustrated on page 101 of our last issue, is Mr. Hubert E. Gilford, A.R.I.B.A., of Purley.

"The Law relating to Factories and Workshops."—Messrs. Eyre & Spottiswoode announce that the fourth edition of this book, by May E. Abraham (Mrs. H. J. Tennant) and Arthur Llewelyn Davies, will be ready early in November, price 5s.

The R.I.B.A. and President McKinley's Death.—On the occasion of the death of President McKinley a cablegram was sent by the President of the Royal Institute of British Architects to Mr. Peabody, president of the American Institute of Architects, expressing sympathy.

The Lincoln Diocesan Training College has had a new wing added to it, over £7,000 having been expended upon this and some improvements to the old buildings. The accommodation is increased from 56 students to 104, of whom 83 reside on the premises.

The Royal Albert Asylum, Lancaster, has been extended at a cost of £15,000. Special provision is made by the new wing for epileptics, cripples and feeble patients, whose removal from the main block will enable the number of patients to be increased to about 800.

A Statue of Oliver Cromwell will be unveiled on October 23rd at St. Ives, Hunts. The statue in bronze, which has been on view at the Royal Academy, is by Mr. F. W. Pomeroy. It will be placed on a pedestal of York stone, in the centre of a base consisting of two broad steps of Aberdeen granite, with ornamental lamps on granite monoliths at each corner.

Baths for Old Trafford.—The Stretford District Council have approved plans for the erection of public baths on land situate at the corner of Northumberland Road and Crook Street, Old Trafford, and application will be made to the Local Government Board for sanction to borrow the sum of £14,000 to defray the cost of the proposed building. It is intended to provide two plunge baths, one for males 75ft. by 30ft. and the other for females 60ft. by 26ft., and twenty-one vapour baths.

The R.I.B.A. Autumn Examinations will be held as follows: Preliminary on November 5th and 6th; Intermediate on November 5th, 6th, 7th and 8th; Final and Special from November 15th to 21st. Applications for the Preliminary and Intermediate must be sent in on or before October 12th, and for the Final and Special examinations on or before October 26th. Examinations qualifying for the office of District Surveyor in London (pursuant to the provisions of the London Building Act, 57 & 58 Vict. c. ccxiii. s. 140), and of Building Surveyor under Local Authorities will be held by the Royal Institute on October 24th and 25th, 1901. Applications must be sent to The Secretary R.I.B.A. on or before Thursday, October 10th.

Royal Academy Competitions.—This year the Royal Academy biennial gold medals are awarded in painting, sculpture, and architecture, and each carries with it a travelling studentship of £200. The medal for historical painting, generally regarded as the chief of the biennial prizes, is given for the best illustration of the subject, "Saul and the Witch of Endor," 1 Sam. xxvii., 7–14) on a canvas measuring 40in. by 50in. Sculptors have to submit a model (the principal figure 3ft. in height) representing "Boadicea urging the Britons to avenge her outraged daughters," while architects have "A Town Hall for one of the London Borough Councils." The Turner gold medal and scholarship of £50 is also awarded biennially, and the subject for the present year is "One of the Bridges over the Thames in London." The subject for the Creswick landscape prize is "Cumulus Clouds over a Fen Country." All the paintings and models have to be sent in early in December, and on the 10th of that month the medals and prizes will be awarded by Sir Edward Poynter.

New Cottage Hospital at Ebbw Vale has been erected at a cost of £3,000 from plans by Messrs. Lansdowne & Greggs, architects of Newport, Messrs. S. T. Davies & Sons, Ebbw Vale, being the contractors. The building is situated near Hillside House. The ground floor contains the matron's suite of rooms, entrance hall, receiving room and operating theatre. The floor is mosaic, and the walls of adamant cement. The second floor contains a main ward with five beds and a cot; ward with four beds for more serious cases, and a special ward with one bed. There is also a dayroom for convalescents, opening out by means of French windows to a large verandah. The second floor also contains a bathroom, kitchen, lavatories, &c. The whole is heated by high-pressure steam pipes.

THE ASHMOLEAN MUSEUM, OXFORD.

THE Ashmolean Museum at Oxford, the doorway of which is illustrated on this page from measured drawings by Mr. Valentine Myer, was the first public museum of curiosities in the kingdom, having been founded by Elias Ashmole and opened in 1683. The nucleus was formed by the collections of John Tradescant, and not until recently has the museum been made to serve a scientific purpose. It contains models, ethnographical collections, English and Egyptian antiquities, and miscellaneous curiosities. The doorway, which is considered to be one of the finest specimens of this style of work, is said to be the work of Sir Christopher Wren, but the rest of the edifice is generally attributed to another architect. The doorway is now unfortunately in a very decayed state, having been built in friable local stone. Any record of it is therefore the more valuable, and unless steps are taken to preserve it much of the beautiful detail will soon be indistinguishable.

QUERIES ANSWERED

RESPECTING

Our Insurance Schemes.

From time to time we have queries addressed to us by readers on points affecting our Accident Insurance Schemes. The greater number of the queries relate to the conditions of payment, and to enlighten those who may still be in doubt we think it desirable to state

(1.) That it is not necessary to subscribe direct to the office in order to secure the benefits.

(2.) That even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.

(3.) It is sufficient to have an intimation from the newsagent that he supplies copies regularly.

(4.) That policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.

(5.) In applying it is not necessary to write a long letter—a postcard will do, giving the full name and address of the newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

Scheme No. 1 is a free Accident Insurance of **£500.**

FREE.

(*Every regular reader of the Builders' Journal is entitled to this without any payment.*)

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages :

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

(*For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.*)

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages :

Ordinary Risks, Premium, £3/-/-

Hazardous Risks, Premium, £3/10/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

(*This is a most valuable policy, with advantages not to be had from any other insurance company.*)

If these schemes interest you, write for full particulars to

Saturday, October 12.

Northern Architectural Association.—Visit to New Castle Breweries Premises, Haymarket, and Electric Power Station, Newcastle.

A New Mission Church at West Bromwich, to be dedicated to the Good Shepherd, is being erected in Spon Lane. It will consist of an exterior porch and mission hall 51ft. by 27ft., and there will also be a large chancel, organ chamber and vestry. The building is being erected on the site in such a position as to allow of a permanent church being built on the land adjoining, which will be commenced as soon as funds will permit, after which the mission church will be used for Sunday school and parochial purposes. The church will provide accommodation for 304 persons, including the choir. The builder is Mr. T. Hardy, of West Bromwich, and the architects are Messrs. Wood & Kendrick.

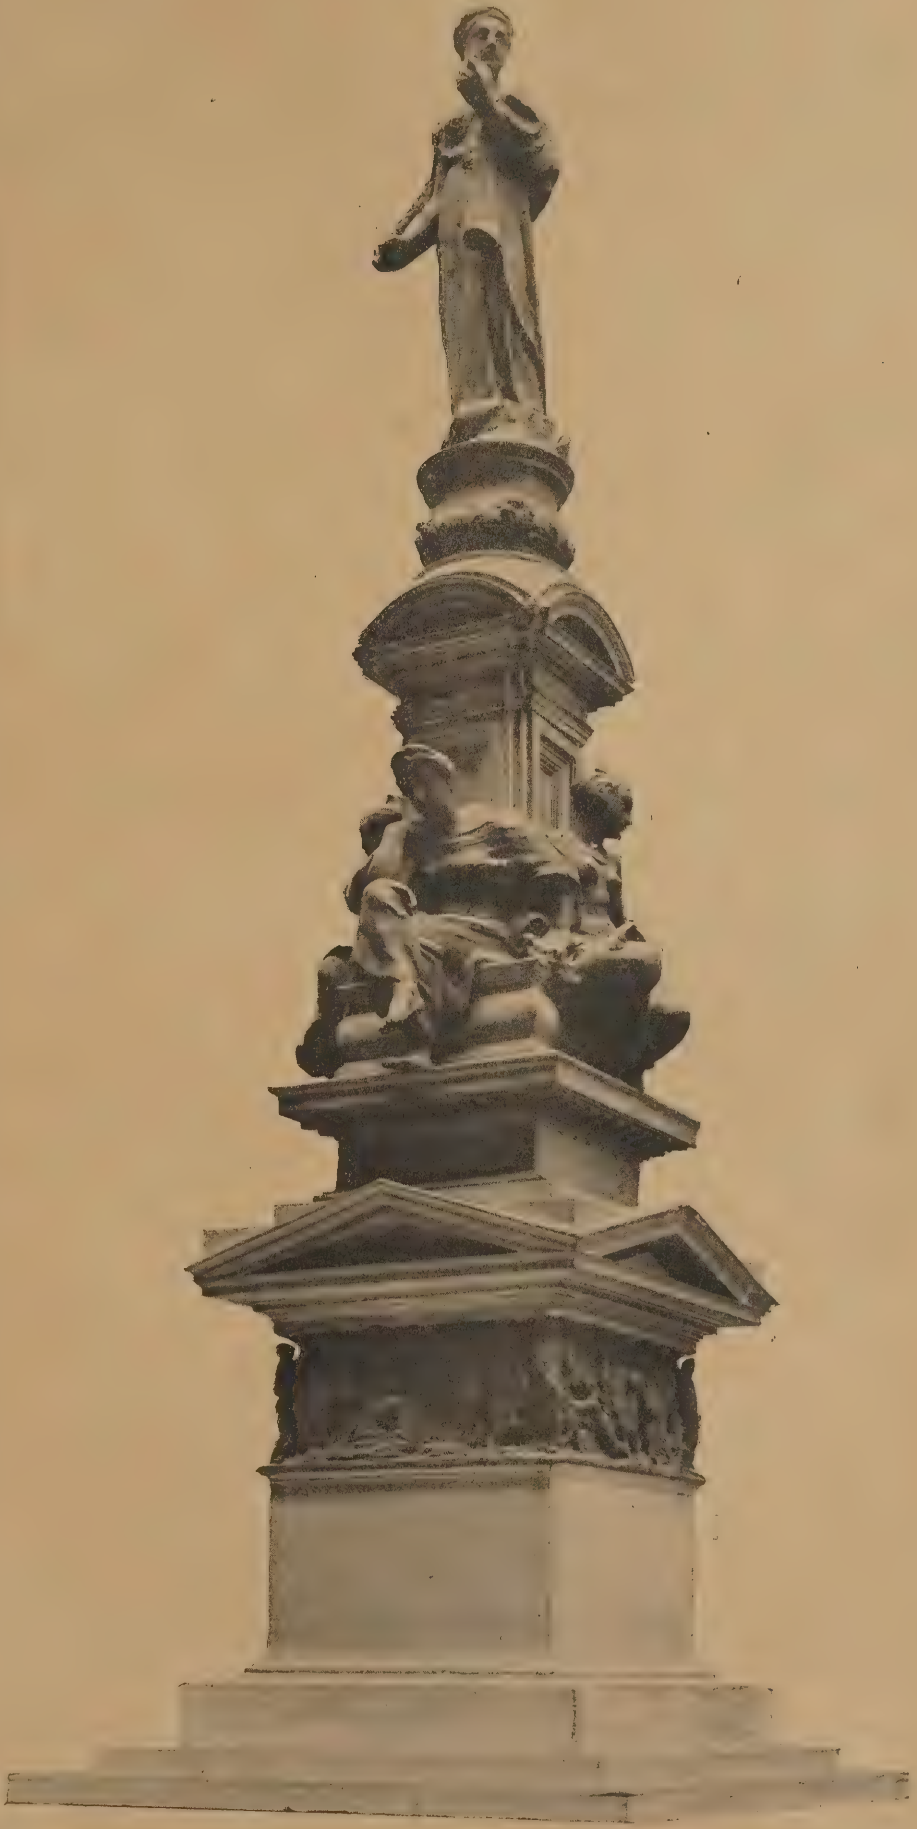
An Architectural Causerie.

The Queen Victoria Memorial. FOR the moment the interest in the Queen Victoria Memorial lies fallow, but it will be re-awakened this month by the public exhibition of the designs made by Mr. Aston Webb, Mr. T. G. Jackson, Mr. Ernest George, Dr. Rowand Anderson and Sir Thomas Drew. As everyone knows, the work is to be carried out by Mr. Brock and Mr. Aston Webb, but it will be interesting to compare the selected design with those of the other four architects; and it will also be of service to extend the comparison to Alfred Stevens's memorial of the Exhibition of 1851, the small model of which in South Kensington Museum is here illustrated.

Emperor William and the Fountains. WE believe that the members of that august body the Royal Academy were not particularly pleased when our own King claimed the whole of one of their walls for M. Constant's picture of Queen Victoria, but the regal authority in matters of art is much more extensively and vigorously exercised by Emperor William, of whom we once heard it said that "it would be a good thing for Germany when he was ten years older." As our readers are doubtless aware, the city architect of Berlin, Herr Hoffman, has designed three fountains for the Friedrichshain Park in the north-east of the city, but the Kaiser has refused to sanction their erection because he considers that their ornamentation, which illustrates well-known German fairy-tales, is too garish and showy. At last Wednesday's meeting of the Permanent Art Committee of the Berlin City Council the matter was discussed, every effort being made to avoid reference to the political side of the question and to treat it simply from an artistic standpoint. An examination of the previous designs for the fountains showed that while the various artists differed in detail they were almost unanimous in giving to subjects from fairy-tales a bold effect which the Kaiser condemns. Although no resolutions were taken, it was evident from the tone of the meeting that the Committee desire to harmonize the artistic views of the Kaiser with those of the city architect. What will ultimately be done remains to be seen. We may say, however, that if these designs savour at all of that altogether objectionable novelty which characterises modern German art and architecture—and we suspect as much—the Kaiser's objections would have our hearty support. This, however, is not the prevailing feeling about the matter in Berlin; it certainly was not that of the artist Dietz who caricatured his Emperor in "Simplicissimus"—a disgusting publication—for which little matter he will be confined in a fortress during the next eight months.



MODEL OF THE MEMORIAL OF THE GREAT EXHIBITION OF 1851. BY ALFRED STEVENS.

Boot-blacking at Chichester. MR. EDWARD S. PRIOR has made known in a letter to the "Times" the boot-blacking operations which have been carried out at Chichester Cathedral in order to "smarten it up" for the visit of the Church Congress on Saturday last. These are the facts: The Purbeck columns have had the patina of age smoothed away and varnished into blackness. While this lasts it will be to most eyes a blot on the texture of the marble, but, as at Lincoln and Salisbury, a scaling and sweating will follow on the re-polishing of the Purbeck, and afterwards the shafts will regain their surfaces. But this is not all, for the carved capitals have been polished too; and since their intricacies yielded reluctantly to the processes of the upholsterer, they needed to be "gritted and snaked" to make a Congress spectacle. At every touch of the polisher they lost that clean arris and delicate surfacing which was given them 700 years ago by the Purbeck sculptor and had lasted till to-day. The recent sculptors' work of the cathedral has been smartened also. Just as the nineteenth-century sculptor eighty years ago pared down the fourteenth-century effigies to make them tidy, so now the turn has come for him. This completes the catalogue. The facts need no comment, but they would form an inspiring addition to "Highways and Byways in Restoration." There seems to be an opportunity for a modernised edition of Dante, considered architecturally.

To kill the Jerry-Builder. ALL October is being allowed to the 68,000 members of the Amalgamated Society of Carpenters and Joiners to ballot on the scheme for starting co-operative building and joinery works in various parts of the country; the first one to be in the Midlands. The benefits to accrue are understood to be the raising of the members' status by establishing a standard wage in all districts where the works are in operation, and the settlement of disputes by the society offering to complete the jobs themselves; and indirectly it is thought that the scheme will kill the jerry-builder. Mr. Walter Crane spoke last week of those "small brick boxes with slate lids" with which everyone is familiar. Well, provided the boxes are soundly built and the lids fastened on tightly, there is not much harm done. It is when the wind blows in around the window-frames and the water comes trickling down the walls that we need to damn the jerry-builder and his methods. His is always a money speculation, and his idea is not to build houses for people to live in but houses to sell profitably. His doom would therefore come as a welcome; and if the carpenters and joiners can do this while carrying out their calling honourably they will confer a great benefit on the community.

JOHN JAMES BURNET, A.R.S.A.

MEN WHO BUILD.

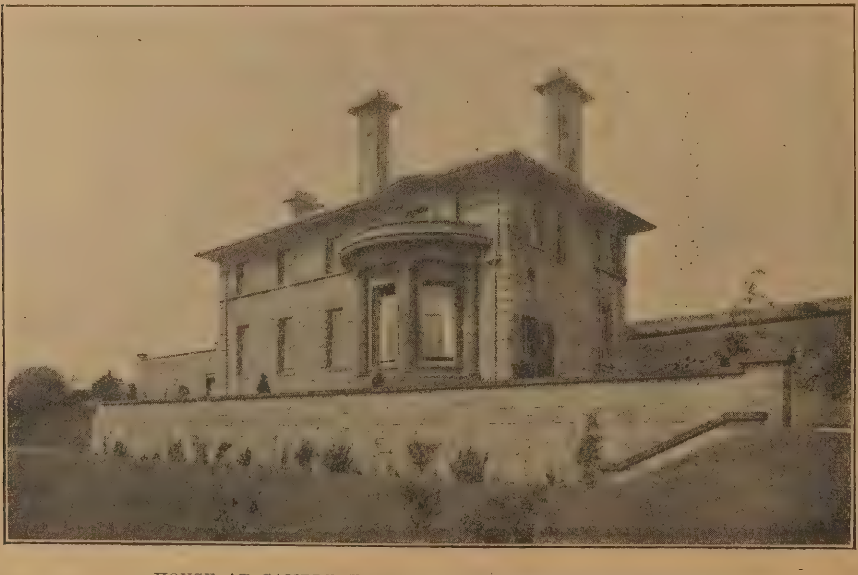
No. 65.—JOHN JAMES BURNET, A.R.S.A.

IT is remarkable that Glasgow—that ugly dirty city of commerce—should possess so many capable artists and be concerning itself so much about Art. This is undoubtedly due in a large measure to a natural reaction from the commercialism, but it would be as nothing were it not for the fact that the public taste of the city has been educated by a few artists, and architects have naturally exerted the most pronounced influence by reason of the insistence of their buildings. Glasgow, though the second city in the Empire, is not unwieldy, and being a new one the taste of its citizens has not been made bizarre by intercourse with many fashions; moreover, because of its comparatively small area, the surrounding country is easily accessible and not relegated to an unimpressive distance. The old buildings of Glasgow are few and insignificant, the Cathedral (which does not dominate the town, as generally happens) being an inferior specimen of the period. Then, again, the city having at first sought only one object—that of commerce—has a fine substratum of the imaginative to act as a background for the placing of grandiloquent buildings. The public taste of Glasgow had, in fact, been deadened by the commercialism, and it only needed to be quickened into real life in order that it might advance the more rapidly in art. That the reaction would go too far in the opposite direction might be expected, and we see all the ultra-emotional "swirl and blob" trash of the "L'Art Nouveau" class proceeding from Glasgow's art schools; and also from several firms of artists whose advertising methods are somewhat amusing, as they show the absurdity of art as a commercial trade-system by carrying it to its logical extreme. It is to be hoped that this tendency—very harmful, if continued—may be checked by the sobriety of the Scotch character; but one of the most distressing facts is that the rubbish should even contaminate architecture, it unfortunately affording an easy method for the ignorant to make a show.

Among the foremost of the educators of public taste in Glasgow must be reckoned the Burnets, father and son. The latter, Mr. John James Burnet, possesses a temperament peculiarly suited to such a work—masterful, self-reliant, energetic and impulsive, a character that is easily read in the portrait at the head of this a ticle. His personality is marked, yet he is withal free of those attributes of extremes and impracticabilities which so often characterise such men. The thorough knowledge of architectural subjects which he possesses was gained from the manner of his training abroad and under his father.

Mr. Burnet's particular notion in regard to what architecture should consist in is that the architect should be a poet as it were, phrasing the parts of a building into one harmonious whole expressive of the subject, the time and the public; this he illustrates by citing Rudyard Kipling. The theory is undoubtedly true of the architect, but doubtful in its application to architecture, which is a co-operative product and only reaches its highest levels when all the units in its development coalesce. Mr. Burnet's notion, however, gives us a clue to his work. We find his personality expressed throughout all his designs, which we esteem correspondingly. His position is the same as that of every self-respecting architect, from the Renaissance (and presumably before—at least in Greece and Egypt) to the present day. That poets should express the ideals of their country and their time unerringly would never be expected by anyone competent to speak; and it is equally absurd to expect architects (using the word in its present-day sense) to do the same—they are themselves first and other people afterwards. According as their view, so is the pleasure which they give to those who are intellectually or artistically of a similar bent. Now Mr. Burnet's personality, as we have already said, is marked, and his work must pre-eminently be measured by it, in the same way as the works of Robert Adam, Butterfield, Pugin, Street and Barry, to mention a few names, are measured by theirs. Incidentally of course these men made discoveries and solved problems of scientific fact-interest to us, but their chief claim to anything more than ephemeral notoriety is their personality.

Mr. Burnet's work is very distinctive, having a virile strength characteristic of the man, and to understand it properly we need to know something of his career. He was born in 1859. He was educated during 1874-77 at L'Ecole des Beaux-Arts, where he was trained as an engineer as well as an architect. This step was then an uncommon one with English architects, but the efficiency of the school and the advantages of its methods have now been generally recognised; its benefit to Mr. Burnet is apparent. American architects have largely availed themselves of this school and have been soundly rated for adopting French detail, but any little trace which Mr. Burnet retained has worn off in the course of time, though the neo-Grec, then in full swing, can be seen comparatively strong in his first works—the Royal Institute of Fine Arts in 1881 and the offices of the Clyde Navigation Trust in 1886. But this influence gradually weakened, until in the front of the Glasgow Athenæum to St. George's Place, erected in 1889, his early academical manner ended. This latter building is most admirable for its free and yet

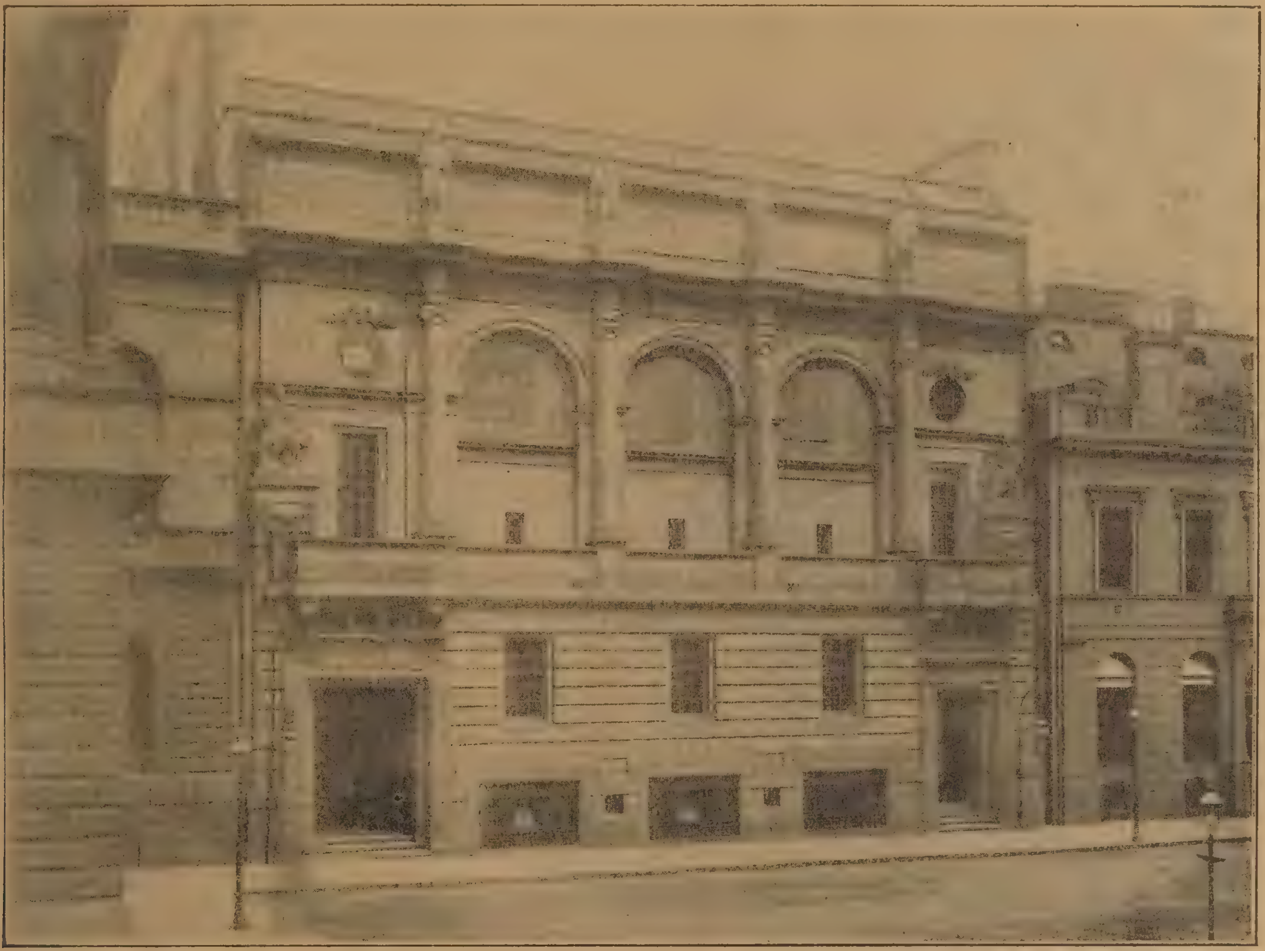


HOUSE AT CAMPBELTOWN. JOHN J. BURNET, ARCHITECT.

most reserved treatment, and is entitled to rank with any Classic building in Glasgow. The interior is surprisingly well carried out for one so young as Mr. Burnet was at that time.

He travelled and studied in Italy and France in 1878, and on his return became associated with his father, the late Mr. John Burnet, and the firm is still carried on under the style of John Burnet & Son. We may mention here that Mr. Burnet is a man of catholic education and tastes, and travelled and studied in Germany and Italy in 1895 and in America in 1896.

In addition to the above-mentioned buildings, while nominally associated with his father he was solely responsible for Deanston House, Doune, built in 1883, and the Edinburgh Exhibition buildings. From this time the following must be ranked as Mr. Burnet's most important works: The Barony Church, Glasgow (1890); Glasgow Western Infirmary Extension (1892-98); Parish Church, Arbroath (1897); Gardner Memorial Church, Brechin (1898); McLaren Memorial Church, Larbert (1900); Atlantic and Waterloo Chambers, Glasgow (1900); and Parish Church, Rutherglen (1901). The Atlantic and Waterloo Chambers show a novel treatment of the street-shop problem, and its effect can be gauged by the amount of copying already done or being done, particularly by those of the modern Glasgow Arts and Crafts school, who pride themselves upon their originality. The Waterloo Chambers would undoubtedly gain much by having the two extra storeys which it was originally designed to have. The new front of the Athenæum, illustrated on page 140 of this issue, exhibits another treatment of a narrow street-frontage in which the vertical is emphasised instead of the horizontal. The former is appropriate where there are sufficient supports on the ground floor; the horizontal trabeated treatment, on the other hand, is suggestive of the beams hidden behind the face.



THE ATHENÆUM, GLASGOW: FRONT TO ST. GEORGE'S PLACE. JOHN J. BURNET, ARCHITECT.

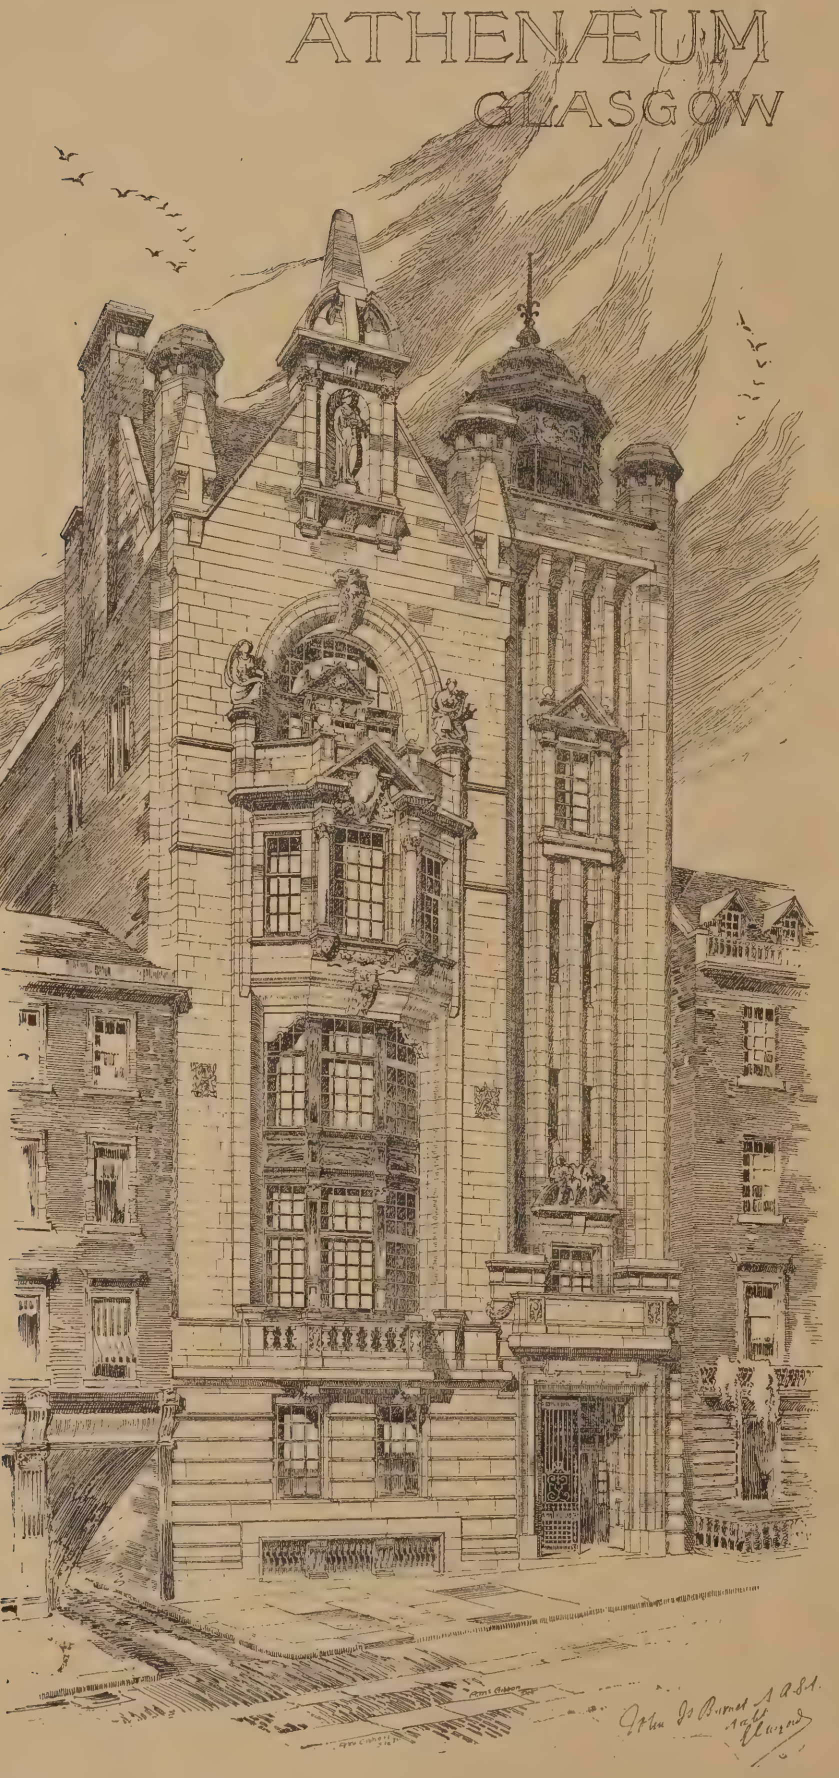
From the Classic feeling engendered by his training in France Mr. Burnet has never got free, though of course he is not now bound by its traditional forms. All his work has that solid, calm and direct-bearing feeling, and not that counterpoise of thrust-against-thrust, ever active, Gothic feeling. Classic in fact is his treatment of traditional Gothic forms, as in the Barony Church and in the Gardner and McLaren memorial churches at Brechin and Larbert, here illustrated. The former, the largest church in Glasgow, opposite the Cathedral, was the first work he did in the Gothic style. But in our opinion it is unsatisfactory, though full of interest, for it has no particular order in its arrangement, the roofs massing awkwardly—the result of an only partially-solved problem; moreover, it shows too much straining after effect with features of constructive significance, the essential quality in Classic which has been generally condemned. It is obvious that this method of "classicising," as it were, is often the only one open to the architect endeavouring to secure a good effect; for instance, when new conditions are concerned which are still in an elementary experimental state, when the refining action of tradition and fuller knowledge is out of the question, the senses can only be satisfied by graphic design. In illustration of this we may refer to the operating theatres at the Glasgow Western Infirmary, illustrated on page 145. Here the interior is absolutely logical, and therefore absolutely right. But on the exterior there are unmatured conditions like outside sunblinds and a roof constructed partly of glass, and features not absolutely essential to the building have been introduced to obtain proportion. The interior shows Mr. Burnet's strong point—the meeting of new conditions. Here his engineering training stands him in good stead: most of the fittings in this operating theatre, one of the first of its kind, were designed by him, and some are now, we believe, manufactured by firms who make a speciality of such articles. Another instance of the same quality is afforded by the novel glass verandah to "Carronvale," Glasgow, illustrated on pages 142 and 143.

In domestic work Mr. Burnet becomes more homelike; but his Classic detail again shows itself. In connection with domestic work we may refer to the treatment of the Gardner Memorial Church, Brechin. From the plan on page 146 and the photographs in our centre plates it will be seen how neatly the humbler and homelier requirements have been united to the essentially monumental character of the church, all suggestion of violent contrast being avoided. This peculiar type of plan, with single aisle and attached hall and rooms, has been adopted by Mr. Burnet in other Scotch churches, whose particular requirements necessitate such accommodation. Mr. Burnet has built a good many churches; and besides those here illustrated we may mention Arbroath and Rutherglen parish churches, and the very pleasing little village Established churches at Corrie and Shisken, in the island of Arran.

Mr. Burnet's work both gains and suffers by the artists working under him upon the details of his buildings, but on the whole he has been very successful in such matters as decorative plasterwork, of which he uses a great deal in his interiors. This is doubtless due to his domination of the design, the same applying to carving in wood and stone, but he cannot always get his subordinate workers to take equal pains with their work. He often designs forms which, from his engineering training, he knows can be constructed, but the engineers he engages to work out the stresses and exact sizes (he is a busy man, and cannot always find time to do this himself) often object on the ground that laborious calculations are involved, and they therefore wish to use the admittedly imperfect stock patterns. Another instance of detriment arising through assistants is shown in the crouching figures supporting the pediments and very low bas-reliefs on the wall under them, in the Glasgow Savings Bank. The designs were modelled by Mr. George Frampton

A.R.A., but they are weak and out of scale, this doubtless arising from the work not having been modelled and carved on the spot by the designer.

A fair share of honours has been accorded to Mr. Burnet. He is an Associate of the Royal Scottish Academy, a Fellow of the Royal Society of Edinburgh, and a Fellow of the Society of Antiquaries of Scotland. He was elected an Associate of the Royal Institute of British Architects in 1881 and a Fellow in 1897. Much as these honours are to be esteemed, their value is greatly enhanced when it is known that they were not obtained in that self-seeking and self-advertising manner unfortunately so common to artistic degrees.



SAND-BURIED CITIES.

Dr. Stein's Discoveries.

On p. 29 of our issue for August 28th last we published a brief account of Dr. Stein's discoveries in Chinese Turkestan. Some further particulars are now available.

Dr. Stein has said that a full investigation of the sculpture, fresco painting, objects of industrial art, and seals, &c., which were dug out of the temples and dwelling-houses of sand-buried sites will help us to resuscitate the civilisation of a region which has played an important part in history as the link between ancient China, India and the classical West. Now, for the first time, have been brought to light some aspects of the everyday life, the home industries and arts of the inhabitants of the villages and settlements of Chinese Turkestan which were abandoned in the early centuries after the beginning of the Christian era, and have since been buried under moving sand dunes. As showing the extent to which the desert has advanced, it may be mentioned that some of the settlements which have been excavated are situated quite 100 miles beyond the edge of the present cultivated area. The great lifeless desert is naturally regarded with much superstition by the people who live in the scanty settlements along the desert edge, and the difficulty of carrying sufficient supplies and water has luckily kept the native "treasure seekers" from visiting and exploiting the more distant and also more ancient ruined sites which have now been systematically explored for the first time under the auspices of the Indian Government.

No doubt can be entertained that the inhabitants of these places were in possession of a culture mainly derived from India, and that they were Buddhists. Dr. Stein's excavations go to prove that their culture was highly advanced, and that the art influences of Greece and Rome were felt even at that great distance from the centres of classical culture. Possibly,

The Most Striking Excavations

made by Dr. Stein were at a site in the heart of the desert north of Niya, where one settlement was exposed, covering with its scattered dwellings and shrines an area of about six miles by four. Until digging began all that was visible were weird-looking rows of bleached timber pieces projecting in various places like the framework of a wrecked ship from between the sand dunes. Round most of the sand-buried houses were brought to light carefully-planned little gardens with avenue of trees, fenced lanes, orchards, and so forth. It was truly astonishing on clearing away the sand to find under the shrivelled hedges heaps of dried leaves just as they had fallen in ages gone by. The gardens were much the same in character as those still to be found in Turkestan to-day The trees were mostly poplars and peach, mulberry and apricot trees. There is no evidence that these places were abandoned owing to any sudden catastrophe, but their gradual desertion was evidently due to the impossibility of continued irrigation, causing an advance of the sand.

Colossal Statues.

While articles of real value were therefore removed by their possessors Dr. Stein found in the dwelling-places many household implements of small value, such as pitchforks, mouse-traps, boots, chairs, shoemakers' lasts, &c. In the ruined temples he found a sort of unintentional exhibition of the fabrics of these remote ages—for in front of some of the idols were heaps of torn shreds of elaborately-worked silks and other fabrics which had been deposited as votive offerings. Many colossal statues in stucco were unearthed from the monasteries and temples. One of the latter contained in its cloisters over 100 statues, all more than life-size. While as many as possible of these were cleared for the purpose of taking photographs, only a few could be rescued, as, when the protecting sand was removed, the great stuccoes threatened to collapse owing to their inner wooden-work having rotted away. However, interesting portions of them were successfully brought away. Dr. Stein is now resuming his work as inspector of schools in the districts along the North-Western frontier.

THE ROYAL BUILDING TRADES' SCHOOL AT STUTTGART.

THE BEST OF ITS KIND IN GERMANY.

Dr. Rose, British Consul in Stuttgart, has prepared an elaborate report which has just been published by the Foreign Office on the technical, agricultural, commercial and art schools of Würtemburg. Of these the Royal Building Trades' School is the most important institution for secondary technical education in Germany. This was evidently recognised by the authorities of the South Kensington Museum, who, after having inspected the school, invited its participation at the Health Exhibition held in London in 1884. About seventy years ago there were no cheap facilities for the further education of skilled building workmen except the costly method of taking lessons from private teachers, foremen or architects. This disadvantage was also keenly experienced by those who wished to devote themselves solely to technical professions or to become subaltern technical State officials, and who were consequently compelled to limit their studies or to visit technical schools in France or Austria-Hungary.

A Short History of the School.

For these reasons the Stuttgart Trades' School was founded in 1832. In 1840 the school was raised to the level of a polytechnic, but as in course of time it became evident that—owing to the peculiar conditions then prevailing—the curricula for primary and secondary technical education could not exist together in one institution, a new Building Trades' School was founded in 1845. For a period of twenty years (until 1864) the school was only opened in the winter months, as the majority of the pupils were engaged in practical building work during the summer months. During this time the school had made such rapid progress and proved itself of such great importance that in 1865 summer classes were opened, the whole school was placed under the immediate supervision of the Ministry of Education with the designation "Royal Building Trades' School," and a special building was erected at a cost of £30,000. In 1900 two new wings were added to the original building at a cost of £12,000. The special aim of the school is the partial theoretical and thorough practical training of technical engineers, architects, surveyors, &c.

The general technical instruction afforded by the school is assisted and supplemented by the following :—

1. Excursions to works, factories, buildings and various places for the purposes of inspecting practical work, which excursions last two hours, half a day, or two to eight days (the expenses for travelling being defrayed by the school). 2. Competition in the upper classes for prizes given for the best building designs ; public exhibition of competitors' work. 3. Annual public exhibition of all work done by pupils during the year. 4. Permanent exhibition of the best work done by the pupils of the school. 5. School library valued at £5,000. 6. Collections for instruction in architecture, mathematics, construction, mechanical and electrical engineering, chemistry, physics, surveying, freehand drawing, painting in water colours and oil, models, &c., valued at £3,000.

Fees and Costs of Living.

The number of pupils during the winter term was 823 ; during the summer term only 679. The lowest age was 14½, the highest 34½, the average age 20 years. The large number of pupils (259) between 20 and 25 is a very significant fact and worthy of attention. As it may be safely assumed that a very large percentage of these pupils support themselves, their attendance shows what great value they attach to their further education. The fees are upon an extremely moderate scale, and amount to about £2 per term, or £4 per annum : they are partially or wholly dispensed with in the case of talented or industrious pupils who can produce officially-attested papers certifying to their indigent circumstances. For the year 1899 no fewer than 206 out of a total of 1,502 were thus relieved, the amount remitted being £294. There are also a number of small scholarships, of which his Majesty King William II. contributes 20 and the Freemasons' Lodge 3 ; they are worth about £5 per annum. The great majority of the pupils live in extremely moderate circumstances ; the following estimate, which is the result of a number of careful enquiries, will give an approximate idea of their annual expenditure :—

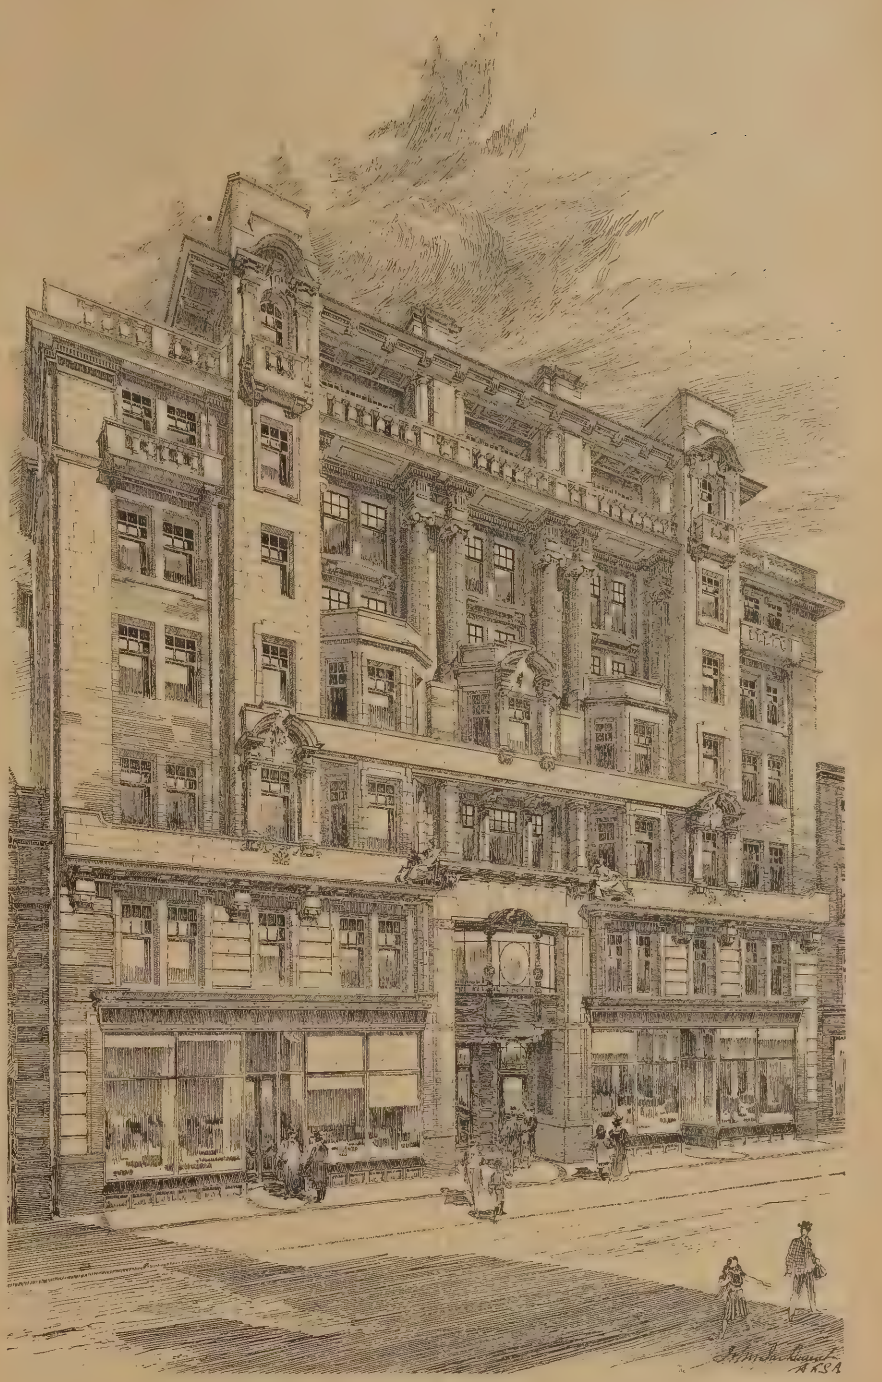
	£	s.	d.
Fees for two terms	4	10	0
Drawing materials, books, &c.	3	10	0
Combined bed and sitting room and board (breakfast, dinner, supper) for two terms	27	10	0
Coals, light and service	3	10	0
Miscellaneous	11	0	0
Total	£50	0	0

During the summer holidays, about three months, they either reside with their parents or relations or earn salaries by practical building, engineering or surveying work, or as draughtsmen. Pupils of the upper classes add to their incomes by giving lessons in mathematics and technical subjects to backward pupils of the lower classes. At the end of each term the best pupils of each class receive prizes worth from 15s. to £1 15s., the second best receive diplomas and the third best honourable mentions. After passing through the full courses, the final examinations for the following diplomas are held ; 1, State diploma for building and architecture ; 2, school diploma for building and architecture ; 3, diploma for hydraulic engineering ; 4, school diploma for mechanical engineering ; 5, State diploma for surveying ; 6, State diploma for surveying and agricultural engineering.

The financial status of the school for 1899 was—

Total expenditure	£10,721
Income from fees	2,781
Deficit covered by State	£7,940

Of all the German schools for secondary education which are known to the author from personal inspection and experience, the Stuttgart Building Trades' School undoubtedly occupies the first rank.



WATERLOO CHAMBERS, 13-23, WATERLOO STREET, GLASGOW.

"CARRONVALE," GLASGOW. JOHN J. BURNET, ARCHITECT.

CHINESE SLATES.

"AT the risk of imitating Artemus Ward, I must commence my account of Chinese slates by stating that there are none," says Mr. C. E. Darwent in a recent issue of the "Slate Trade Gazette." Hence, the Chinese, in giving their reasons for not using slates, may imitate the French priest who said he had twenty reasons for not ringing his church bell when the king passed through his village. His first reason was: "We have no bell."

Failing slates, the Chinese early took to roofing their houses with tiles. These are used universally, except in the poorer class of houses, which are thatched with straw or reeds, or, in the case of the huts of the huge beggar population, with anything that comes handy. The tiles on Chinese houses seem to have all the vices capable of being possessed by tiles. They are invariably black and of very coarse gritty clay. This shows itself in the surface texture, which is rough and sometimes even covered with sharp points, so that the finger might easily be slightly torn as it is passed over. Their capacity for absorbing moisture is enormous. Those of good quality cost £1 a thousand; those of poor quality 12s. a thousand. Each tile is held in its place by the weight of the one above it. It can easily be seen that to enable the tiles to keep their place at all they must overlap one another very considerably. They do so, in fact, to such an extent that each tile overlaps quite three-quarters of the one below it.

When Shanghai was first founded Chinese tiles had to be employed for foreign houses; but the advent of galvanised roofing is becoming universal for such houses.

Another consequence of the loose character of Chinese slates is that the roofs are in a chronic state of disrepair.

"I have not seen any tiles shaped like the English red pantiles. They are all simply concave, and are laid one on the other with the concave side uppermost. They are laid in lines, with a gutter between each line. The bottom tile of each row is slightly raised by a closed end, upon which appear designs (beautifully chased) of flowers or gods and goddesses, and these give a pretty finish to the roof. As to the laying of tiles, a Chinese contractor tells me that a workman will lay about half a faung a day, a faung being 10 ft. sq. This means that he lays 200 tiles a day. Wages are low. A man earns 30 or 40 cents a day (10d. or 1s. 3d.), according to circumstances. . . . I may add that while my description of ordinary Chinese roofs is, I think, correct, I must in justice say that when all the lines of tiles are in order they look well, while the roofs of the temples are frequently very beautiful. On quite ordinary temples and guild-houses the ridge of the roof has the most attention lavished on it. The ridge of the guild-house of the Shansi bankers in Shanghai is made of exquisitely coloured porcelain. The Symbol of the Sun is in the centre, with a sacred dragon at each side. Such roofs, with their yellow, red and blue tiles, with their quaint dragons and monsters and their graceful upturned gables, are as fine as any in the world; while one of the great temples in Pekin, with its roof of delicious sky-blue tiles, is one of the sights of the world—that is, if the Allied troops during their civilising campaign in that city have not totally destroyed it and robbed the world of one of the choicest productions of human art."

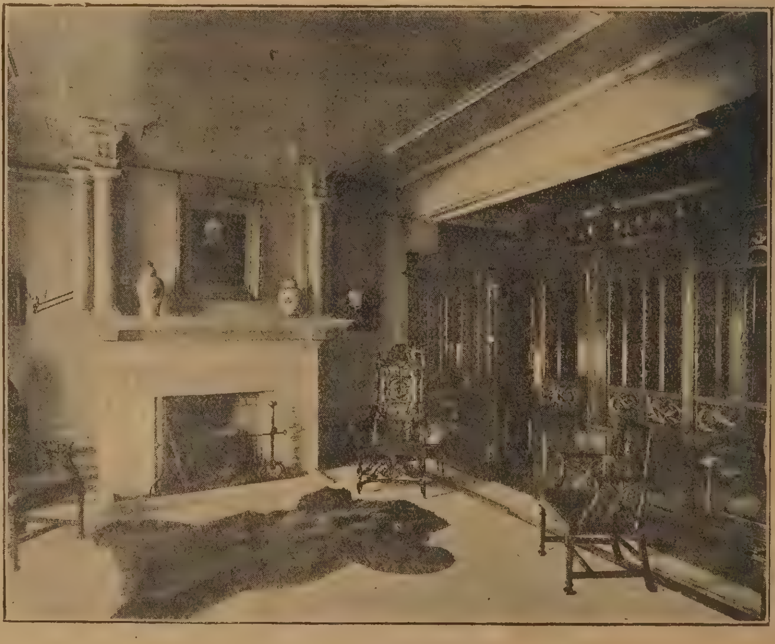
HOVE'S NEW PARISH CHURCH.

THE LATE MR. PEARSON'S WORK.

THE new Parish Church at Hove was reopened recently. It is built of Sussex sandstone from the quarries of Sir Weetman D. Pearson, Bart., M.P., of Paddockhurst, Worth, and to the designs of the late Mr. J. L. Pearson, R.A., the architect of Truro Cathedral. The work is being completed by Mr. F. L. Pearson. The seating accommodation is about 1,300, and the building is 160ft. long and nearly 80ft. broad. Unlike the greater part of the late Mr. Pearson's work, which is of the Early English style with small lancet windows, the general design is of a later period, corresponding with that of Westminster Abbey. The nave, which, including the transept, is 108ft. long and 35ft. wide, is divided into six bays. The two western bays which open respectively into the baptistery and the base of the tower are marked by lofty and richly-moulded arches springing from clustered piers attached to the north and south walls. The next four open into the north and south aisles, and are each of them 16ft. wide. The arcades consist of clustered piers 17ft. high, from which spring lofty pointed arches. Above these comes the clearstory, the parish church, as distinguished from the abbey church treatment, being kept up by the absence of the triforium. The clearstory, it may be added, is comparatively low, as in most English examples, and the windows being grouped two in each bay give the effect of a continuous arcade. The two eastern bays of the nave, which open respectively into the north and south transepts, are somewhat wider than the others, and the arches reach up to the level of the clearstory. The chancel arch is of a similar height and design to that which separates the western bays from the nave proper, but is more rich in detail, and beyond this the three bays of the chancel carry on the design of the nave, and from their width provide ample space for the choir stalls. One of the most remarkable features of the church, however, is the sanctuary, which is 23ft. in length. Although entered by an arch 58ft. high and 35ft. wide, the sanctuary is gradually narrowed in width to 27ft., and this increased height, combined with the reduced width, produces an extremely lofty effect which is in striking contrast to the broader treatment of the nave.

The east windows—three in number, with two lights each—are deeply recessed within pointed arches with clustered piers. There are also two lofty windows on either side of the chancel. The two aisles are respectively 21ft. and 16ft. wide internally, that on the south side of the nave being the wider of the two, and are lighted with lofty windows of three lights each, while the transept is lighted by a richly traceried window of five lights at the south end and an equally fine rose window at the other end. Leading out of the south transept a small chapel 46ft. by 21ft. provides accommodation for daily or occasional services. It is 32ft. in height. Like the baptistery at the west end of the church, it is vaulted throughout, and at the east end it terminates in a polygonal apse. The south wall of the two western bays of this chapel, it may be added, is completely filled in with six-light windows of very broad proportions, while those of the apse are of three lights each and are comparatively narrow and lofty.

To the north of the choir and sanctuary there is the organ loft and two vestries, that for the choir measuring 20ft. by 24ft., and over the vestries there is a church room with accommodation for about a hundred persons, for confirmation classes, missionary meetings and other similar gatherings. With reference to the organ loft it may be mentioned here that it is not proposed to remove the instrument from its present position until sufficient funds are forthcoming to enlarge it and make it worthy of the church, a work which will probably require some £2,000. The roof, except where it is vaulted, is of oak. In the nave it is divided into six bays by clustered wall shafts rising to a height of 36ft. From this height a series of cross-arches carry it up within 10ft. of its extreme height, where it terminates with a simple cornice. Externally in the south-east are two square turrets, with pinnacles and delicately-pierced tracery-work. At the south-west corner, where Eaton Road intersects the Drive, the tower and porch over the western door still require to be built. The cost up to the present has been about £41,000.



THE HALL, "CARRONVALE."

“CARRONVALE.”

RITES AND CEREMONIES CONNECTED WITH BUILDING.

ALL about us, in the present enlightened age, are customs and ceremonials connected with building that had their origin in the far back pagan days. They have been handed down from generation to generation like the unwritten rituals of a great secret order. When our public buildings are dedicated and public functionaries lay the corner-stone with silver trowels, we are simply following out the customs of our forefathers, with such modifications as the advance of civilisation has made necessary.

The study of the customs which have attended building in the various ages is a most attractive one. Mr. Lewis Dayton Burdick has recently published an extremely interesting book on “Foundation Rites, with Some Kindred Ceremonies: a Contribution to the Study of Reliefs, Customs and Legends connected with Buildings, Locations, Landmarks, &c.”

Human Foundation Sacrifices.

In Alaska, before the United States began to govern it without its consent, human foundation sacrifices were common. Among the Dyaks of Borneo, when a house was to be built a big hole was dug for the first post, which was suspended over it. A slave girl was dropped into the hole and crushed to death. The kings of Burmah buried four human beings alive at the corners of their capital, that their spirits might keep watch and ward off invasion. In the Japan of the seventeenth century, when a great wall was to be built a slave would voluntarily lie down in the trench and be crushed to death by great stones lowered upon him. Many times in Asia there have been popular panics caused by the fear that the old foundation customs were to be revived. As the Siberian railroad drew near the Chinese frontier, there was a great hullabaloo in Pekin. It was rumoured that the Russian Ambassador had asked her Humanity, the present Chinese Empress, for a couple of thousand children to bury under the rails. There was a similar scare in Calcutta when the Hoogly Bridge was building. The natives got it into their heads that after long refusal Mamma Ganges had agreed to be bridged on condition that each pier should rest on a layer of children's heads.

Ultimately animals and animal and vegetable products were offered instead of human beings. That Naples is built on an egg is known to all readers of the mediæval legends about the great enchanter, Virgil. A tallow candle was built into the wall of St Osyth's, Essex. A chicken, cock, lamb or something else takes the place of a slave or other human victim. There is a Russian folk-belief that the first person to enter a new house will die within the year unless an animal is killed and buried when the first stone is laid.

Curious Customs.

“In modern Greece,” Mr. J. G. Frazer tells us, “sometimes, instead of killing an animal, the builder entices a man to the foundation-stone, secretly measures his body or a part of it or his shadow, and buries the measure under the foundation-stone; or he lays the foundation-stone upon the man's shadow. It is believed that the man will die within the year. In the island of Lesbos it is deemed enough if the builder merely casts a stone at the shadow of a passer-by; the man whose shadow is thus struck will die, but the building will be solid. A Bulgarian mason measures the shadow of a man with a string, places the string in a box and then builds the box into the wall of the edifice. Within forty days thereafter the man whose shadow was measured will be dead and his soul will be in the box beside the string, but often it will come forth and appear in its former shape to persons who were born on a Saturday.” In these cases the shadow is the life, soul or strength, according to a common article of primitive faith no harder to believe, perhaps, than most other things are.

A Roumanian Folk-Tale.

But let us borrow a Roumanian folk-tale from Mr. Burdick. Radu the Black had promised Manoli and the other masons gold in piles and titles to burn if they would build him the fairest palace ever seen; but if it was not up to specifications, he swore that the bunglers should be walled-up in his monastery. Four days the masons worked, there being no union to prevent them. Four nights all that they had built tumbled down—toppled over, we may believe, by the walking delegates of the Devil. On the fourth Manoli had a dream of dread. A voice had sounded in his ear that every night would undo the toil of the day if the masons did not build, living, into the wall the first woman that should come upon them. Manoli told his dream to his fellow workmen. All took oath to obey the voice. The next morning Manoli, full of black presentiment, stood upon the scaffold and watched the country round about. His wife, Flora the Beautiful, was coming with his breakfast. He held her in his arms while the wall of death was rising around her. When she could be seen no more he could just hear her moaning faintly: “Manoli, Manoli, the wall is pressing on me and my life is dying out.” And now the palace stood solid. Soon it was finished, magnificent, a wonder of the world. The masons stood upon the scaffolding awaiting Radu and the glorious wage.

By the prince's command the props of the scaffolding were knocked away and the masons dashed to death. Manoli clutched a projecting carving and would have saved his life had he not heard just then from beneath the wall the feeble moaning voice: “Manoli, Manoli! the cold wall is pressing on me; my body is crushed; my life is dying out.” So down among the dead men let him lie; and serve him right.

There are some ceremonials still followed in building that it would be worth while to study closely. Such, for instance is the custom of fastening up the “roof-tree” when the framework of the roof is finally in place. We have heard it said that the symbolic meaning of this ceremonial is that the framework of the house is supposed to have made use of the trunk of the tree, and consequently the topmost crown of the tree itself is hoisted up to occupy its old place once more. If this was the origin of the custom, it was doubtless a rite of propitiation. In this prosaic age, however, the purpose of the ceremonial is evident. It is an invitation from the builders to the owner to recognise (by a donation of liquor or cigars) the progress that has been made. A particularly interesting feature of this ceremonial is the modification that has come about with changed conditions in building. The “roof-tree” is not confined to wooden houses, but it is changed into a flag for other buildings.

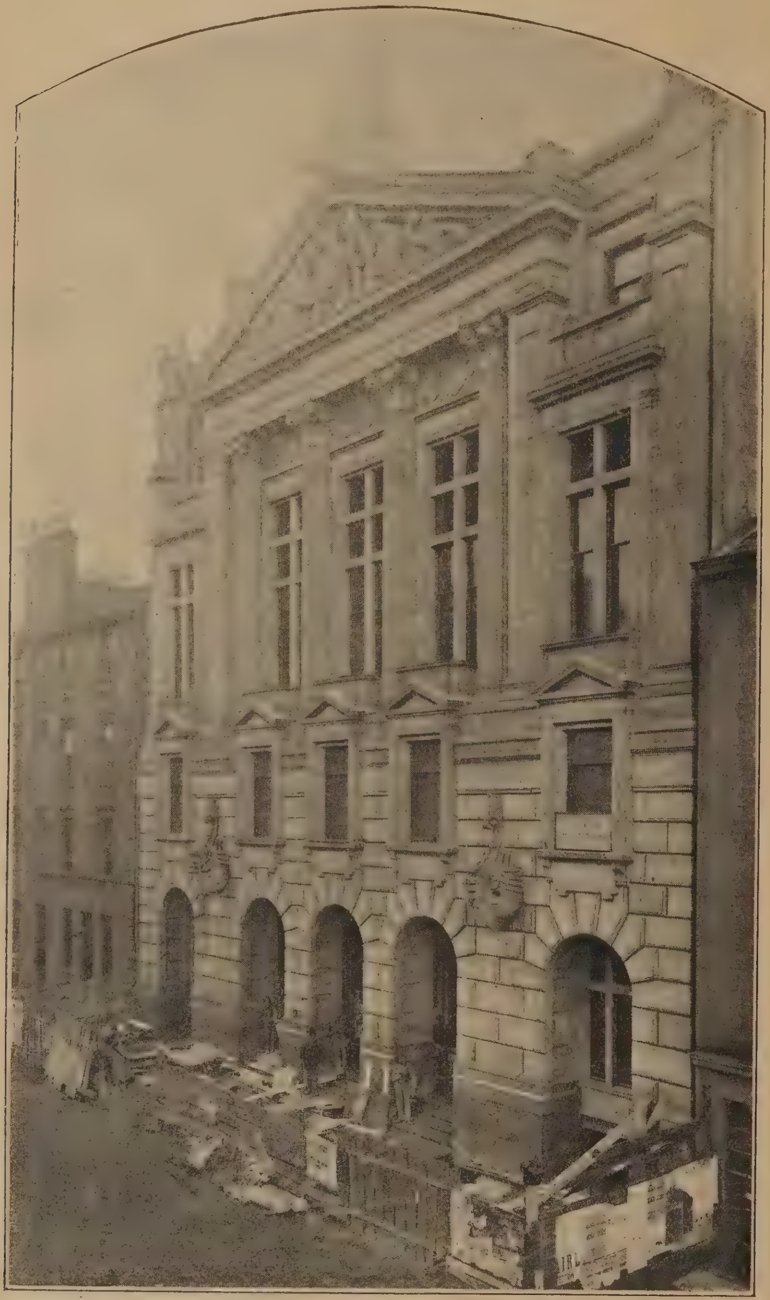
Workmen and Liquor.

In this connection it is interesting to note the important part that donations of liquor have played in building in the American colonies, especially in those which had a large proportion of Dutch settlers. It was long a standing complaint that the most onerous part of the expense in church-building was the enormous bill for “drinks” for the workmen. A detailed example is found in the bills for the erection of the first stone house in Albany, in 1656. This was a Government house or fort, and it cost about £700. When the old wooden fort on the site was torn down, a tun of strong beer was furnished to the workmen. When the first stone of the new edifice was laid, 33 quarts of brandy and 32 guilders' worth of other liquor

THE DINING-ROOM, ‘CARRONVALE.”

were called for by the workmen and duly served. So much as a start for the masons. The turn of the carpenters came when the cellar beams were laid. They were satisfied with two barrels of strong beer, three cases of brandy and 72 florins' worth of small beer. This satisfied them until the second tier of beams was laid, when they had two more cases of brandy and a barrel of beer. There was no chance for dry rot to attack these beams, for they had all been "wet" previous to laying. They were stacked up without the walls and were brought inside one by one by eight men, as they were wanted. For each beam carried these men were given half a barrel of beer, and there were thirty-three beams in all! All of the teamsters, wood-carriers, carpenters, stone-cutters and masons had a daily allowance of a gill of brandy and three pints of beer apiece at dinner, besides special treats. This did not satisfy them, however, and they "struck" for another daily pint of beer. When the roof-tree was set in place, the carpenters were satisfied with a half barrel of beer, surely a most modest demand. Under the name of "tiles beer" a half barrel went to the tile setters. A winding staircase was a feature of the fort, and when this was finished five guilders' worth of liquor gave the workmen the necessary winding gait to test it.

One-eighteenth of the cost of the building went down the throats of the workmen! Fortunately, the building customs have changed from those strenuous times, or only brewers would be able to build houses.



OFFICES OF THE CLYDE NAVIGATION TRUST, GLASGOW. JOHN J. BURNET, ARCHITECT.

BARROW ABATTOIR.

NEW public slaughter-houses are being erected by the Barrow County Council at the north-east end of Cavendish Street, and adjoining the electric light station and the refuse destructor, at an estimated cost of £18,000, from designs by Mr. W. H. Fox, the borough engineer, but only about two-thirds of the scheme is being carried out at present. The site of the present premises is a most convenient one, bounded on the north-west and north-east sides by the proposed cattle market, on the north-east side of which runs the Furness Railway main line. It has also the advantage of having two approaches, and is such that will be convenient for the butchers, convenient for rail, and convenient for the refuse destructors, where condemned diseased meat and refuse which cannot be profitably dealt with may be destroyed by fire. The slaughter-house and lairs will be at least 100ft. from any dwelling, and can be worked without nuisance to anyone. The area of the site is 7,490 sq. yds., a considerable portion of which is made ground. The buildings when completed will, exclusive of the superintendent's house, consist of five blocks, the first measuring 100ft. in length by 22ft. in width, comprising superintendent's office, fodder shed and store. The second block, measuring 158ft. by 44ft., consists of a slaughter hall, 115½ft. in length and 25ft. in width; cold stores with chill-room for seventy carcases; engine-room and stores on ground floor and refrigerating room over. The third block, measuring 158ft. in length by 29ft. in width, consists of lairage accommodation measuring 120ft. by 25ft. 3in., and space at the north-east end of the block for a tripery and gut-scraping house. The fourth block, measuring 78ft. in length by 33ft. in width, consists of a pig slaughter-house, a cooking-room and a boiling house. The fifth block, measuring 44ft. in length by 21ft. in width, comprises a block of sixteen piggeries. The exterior walls of the building are faced with bricks similar to Accrington plaster bricks, and the interior of the slaughter-houses and cooling-room are faced with glazed bricks. The floors of all the slaughter-houses, cooling-rooms, lairs and piggeries are of concrete, made so as to give a foothold, and the roofs are covered with Westmorland green slates and have louvre ventilators. The slaughter-house, cooling-room and chill-rooms are fitted with wrought-iron rails and runners, so that the carcases can be run where required with as little handling as possible. The cattle and sheep lairs are fitted with wrought-iron feeding-troughs and accessories of the most approved kind. A complete system of sewerage and drainage is provided, and also a complete system of electric lighting, and hot and cold water supply where required. Trees will be planted within and near all the boundary walls, which will add to the appearance of the premises and help to take away the gloomy associations belonging to such an establishment. Mr. Brown, builder, is the contractor; and the various apparata are fitted up by Messrs. J. Gordon Alison & Co., Ltd., of Birkenhead.

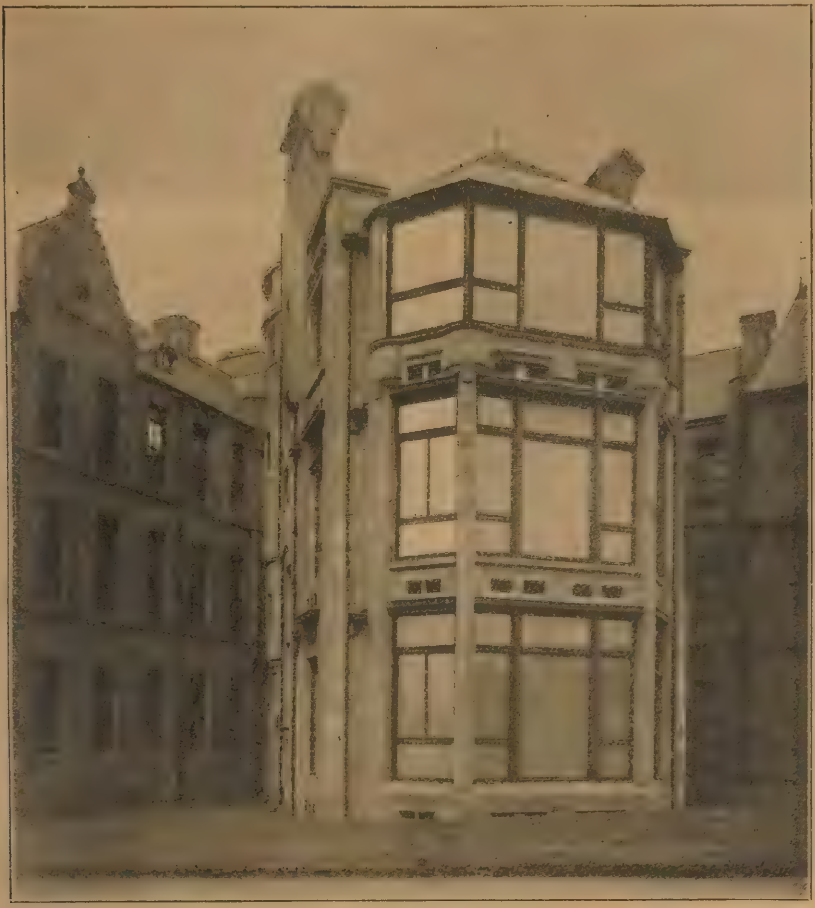
Surveying and Sanitary Notes.

A Motor Car for the Essex County Surveyor is to be purchased by the County Council for use in highway work at a cost of £300.

The Sanitary Inspectors' Association held its annual general meeting last Saturday night at Carpenters' Hall, London Wall, when the eighteenth annual report and balance-sheet were submitted and adopted. The report showed that very satisfactory progress had been made during the past session. A very large accession of ordinary members and associates had been obtained. Sir James Crichton-Browne was elected as an honorary member.

Brockwell Park.—The Brockwell Park Extension Committee have completed their work by the payment of (about) £66,800 for the 43 acres of beautifully wooded land adjoining Brockwell Park. The land was rescued from the builders' hands by this committee in August, 1899, and a provisional contract was secured by them for two years, terminating on September 29th last. It now passes from their hands to the jurisdiction of the London County Council, and thus becomes the property of the people for ever.

The Westminster Paving Contracts.—At a meeting of the Westminster Ratepayers' Committee held last week it was resolved that a deputation should wait on the Westminster City Council for the purpose of urging the members to rescind the irregular deal contract and award the same to the lowest tenderer who has complied with the specification; also to suspend the surveyor pending the result of an enquiry, and to call upon all members of the Works Committee to resign who have been in the habit of visiting and being entertained by a contractor. At a meeting of the Committee held on Friday last it was also recommended that the contract entered into by the Improved Wood Co. should be rescinded, and that the suitability of American red gum for street-paving should form the subject of special and expert enquiry, pending which any further paving operations with this wood should be stopped.



NEW OPERATING THEATRES, GLASGOW WESTERN INFIRMARY. JOHN J. BURNET, ARCHITECT.

A NEW TECHNICAL INSTITUTE.

THE new technical institute for the districts of Kirkdale and Walton was opened at Liverpool recently. The building is the second of that kind which has been completed by the Liverpool Corporation to meet the requirements of the outlying portions of the city. Two years ago an institute for providing instruction in technical subjects was opened in Picton Road, Wavertree, and has since done good work, the classes being well attended by residents in the eastern districts of the city. The building just opened will meet the wants of students in the populous north end of Liverpool, and will accommodate those who formerly attended the technical classes at Arnot Street and Longmoor Lane Board Schools. It is also intended to provide room for the Kirkdale students, who have in the past had small facilities for obtaining instruction in handicraft subjects within comparatively short distance of their homes. A third institute of a similar character is in contemplation for the southern division of the city, but the erection of this will not be undertaken for some time.

The Walton institute is situated at the corner of Carisbrooke Road and Harlech Street. It is built of red Ruabon bricks with stone courses. The main entrance is from Carisbrooke Road. On the ground floor are five class-rooms, one of them being specially set apart for classes in domestic subjects. This has a separate entrance, and is fitted for instruction in cookery, laundry work and dress cutting. There is adjoining, a class-room with seats on a raised gallery, and a special demonstration table for lectures in chemistry and other experimental sciences. On the left side of the main entrance are three class-rooms for instruction in commercial and general subjects, and teachers' room, porter's office and lavatory accommodation are also provided on the same floor. In the basement, in addition to a heating chamber is a room specially fitted up as a workshop for classes in woodwork, wood-carving and modelling, and another for building construction generally. There is a separate entrance to these rooms by means of a staircase in Harlech Street. On the upper floor is a room 32ft. 6in. by 25ft. 6in., arranged and equipped for mechanical drawing, for engineering subjects and for building construction; and another room, 50ft. by 24ft., specially lighted and furnished for instruction in art subjects. On the same floor is a large lecture hall and examination room, 52ft. by 34ft., capable of seating about 300 persons, and adjoining this is an ante- or extra class-room. The whole building is a modern treatment of English Renaissance. The materials employed are red pressed Ruabon bricks and Grinshill stone dressings. The roof is of blue Welsh slates. The floors in the lecture and class-rooms are of pitchpine and concrete fireproof construction, and the examination room on the top floor is finished with a dado 3ft. 6in. high of glazed tiles in two shades of green. The work has been carried out from plans prepared by Mr. Thomas Shelmerdine, city surveyor, the construction being superintended by Mr. Dawson, of the Corporation architectural department. The contractors were Messrs. S. Wearing & Son, of West Derby, and the cost of the building has been about £8,800.

Correspondence.

"The Magazine of Art."

To the Editor of THE BUILDERS' JOURNAL,
LONDON, N.W.

SIR,—Referring to Mr. Harry Hems's letter on page 125 of your last issue, I have Part I. of the "Magazine of Art" before me. On the top of the front cover is "Part I. May, 1878." A supplement, with special pagination, contains "Art Notes for May," and the pages of the "advertising" sheets are dated May, 1878. The price was 7d. The frontispiece is a reproduction of "The General's Head-quarters," from the picture by J. F. Pettie, R.A., for the Royal Academy Exhibition.—Yours truly,

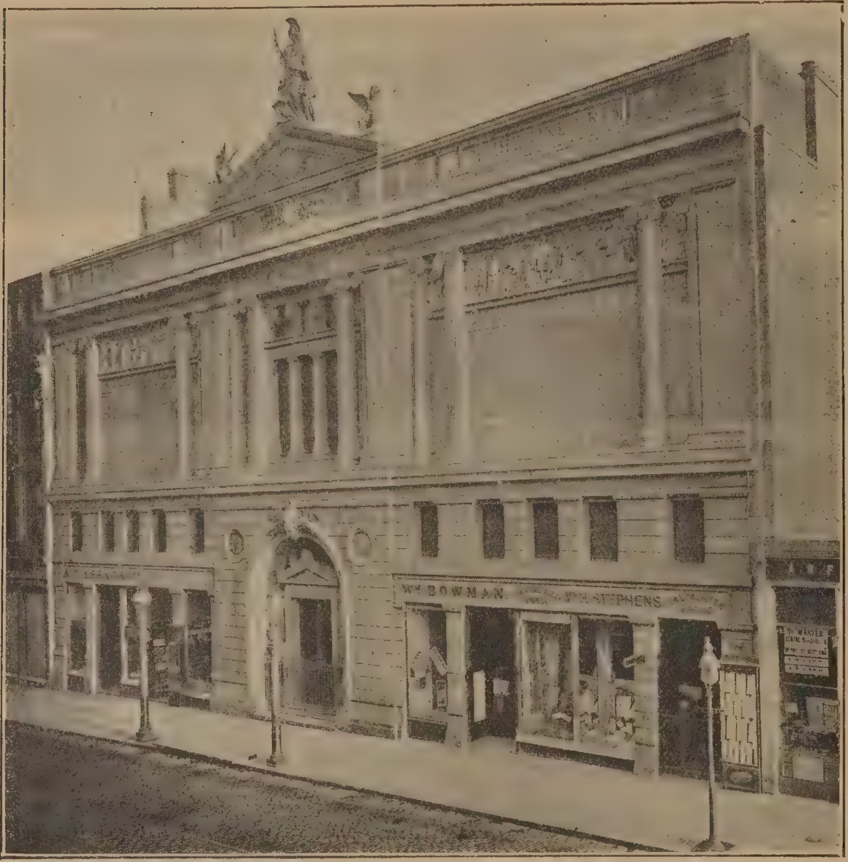
B. W. DEXTER.

ANOTHER SILCHESTER.

What Mr. Talfourd Ely has Found There.

THE main Roman road from Porchester, at the head of Portsmouth Harbour, to Chichester runs through Havant, in the east of Hampshire; and a mile or two south of Havant lies Hayling Island. It is now connected with the mainland by a bridge, but in early times it must have been quite cut off, except at very low tide. Formerly it was of much greater extent, not only on the west and east, where Langstone and Chichester harbours respectively have been excavated by the action of the sea, but also to the south, where the Church Rocks bear witness to the truth of the tradition that the original South Church stood on a spot now covered by the waves. With Roman settlements in Hampshire, Sussex and the Isle of Wight, it is not strange that tradition should have come down to us of the existence

INTERIOR OF ONE OF THE OPERATING THEATRES.



GALLERIES OF THE GLASGOW INSTITUTE OF FINE ARTS, SAUCHIEHALL STREET.
JOHN J. BURNET, ARCHITECT.

of Roman remains in Hayling Island, and fixed the site at a spot which the excavations of Mr. Talfourd Ely have shown to be correct. In the north part of the island, a little to the west of North Hayling Church, is the Towncil Field, part of a larger area at one time held in allotments, and here from time to time coins have been turned up by the plough. In this field there was a slight elevation, manifestly artificial, and when examined carefully it was easy to trace by the different colour of the crops the outline of the foundations below, just as at Silchester the *insulæ* or blocks may be detected by the same criterion of a less fertile yield over the stonework. In 1897 Mr. Talfourd Ely commenced operations which have been carried on year by year since that time. Though he has been rewarded by no very valuable "finds" in the way of curiosities or museum specimens, he has had the good fortune to establish the fact that here stood

A Very Early Roman Building

of large size, the foundations of the outer walls being 150ft. by 170ft. And the method in which the excavation has been carried out is probably unique, for all the work has been done by himself. He had not only to plan the excavations but to carry them out. The popular idea, as exemplified in a plan prepared from an inspection of the lighter lines in the crops, was that of a building with a semicircular apse at one end. This, however, the excavations have not quite confirmed.

As the work progressed it became evident that here was more than a villa in the sense of a country residence. The outer walls seem to have enclosed not only the house but out-buildings, such as sheds or barns. The living-rooms were indicated by the presence of painted wallplaster, roof tiles, and light and dark *tesseræ*, though nothing was found that could in any way compare with the fine pavements unearthed at Brading, Silchester and many other places. This is probably due to the early date of the work, which is approximately fixed at the end of the first century of our era. A bronze coin of Domitian, with the date A.D. 95, was found during the work. Year by year the excavations have gone on and thrown more light on the character of the building, which will no doubt be described fully by Mr. Talfourd Ely when the work is finished. Last year a chamber was uncovered the floor of which was of small flints covered with trampled clay, set with *tesseræ* so thickly that more than eighty were picked out from the space of a square yard. The building must have been warmed by hypocausts, for remains of the furnace and flue tiles were found. A very fine specimen of Romano-British work in the shape of a circular bronze brooch was discovered. The groundwork is blue enamel still brilliant, with a central raised circle, surrounded by smaller ones, each with a depressed setting for a stone. This year a corridor 30ft. long, another about 40ft., and a room 15ft. by 20ft. have been uncovered, so that it is safe to conclude that the house itself was of considerable size. A very interesting discovery consisted of a number of fragments of terra-cotta, with deep flutings. Mr. Ely believes that the pieces are to be accounted for by the building having been burned down. The terra-cotta probably served as a dado or wall-lining, as many of the pieces have a projection at the back apparently for fastening to the wall. The other remains include nails, a Roman key, a razor blade or knife, black Romano-British pottery and a few pieces of red Samian ware. No human remains were met with; the bones belonged chiefly to domestic animals, and there was more than the usual quantity of boars' tusks, some of large size.

New Patents.

None of the patents open to opposition until November 11th, a list of which was published in our last issue, are of sufficient novelty or interest to warrant them being noted in this column according to our usual practice.

The following specifications were published on Saturday last, and are open to opposition until November 18th. The name in italics is that of the communicator of the invention. A summary of the more important of them will be given next week.

1900.—10,538, McLACHLAN, coal-house, ash-pit and other doors. 10,649, MADEN, ventilating sewers. 16,177, McLARTY, apparatus for dressing stone. 17,624, HOLLICK & HOLLICK, cranes, winches, &c. 17,835, PAGE, construction of shop and other windows to prevent condensation of moisture. 18,247, CAMPBELL, kitchen ranges and fireplaces. 18,486, MACLAURIN & MOFFAT, heating apartments. 19,093, ADAMS, roller blinds. 19,397, STODART, window bolt. 20,097, BLENKIN & WARD, door-knobs. 20,197, LACHMAN, metal troughs for electric mains. 20,308, ROTHERY, metal caps used in glazing. 20,333, RYDING, apparatus for domestic fireplaces. 21,405, PRINGLE, apparatus for disinfecting buildings.

1901.—1,704, COLLINS, self-propelled street-sweepers. 5,143, CLARK, road-sweeping and collecting machines. 8,333, ELBERS, process of treating molten blast-furnace slag. 9,960,

ALLISON (*Pullman*), ventilating device. 9,967, JOHNS, window sashes. 10,602, TASSAIN, glazing conservatories, &c. 11,196, WALLACE, arrangement for slewing the derricks of steam winches. 15,215, HESEMANN, means for opening and closing skylights. 16,320, BEDINGTON & BEDINGTON, sash balances for windows.

Engineering Notes.

St. Annes Pier.—The directors of the St. Annes Land Co. have decided to obtain powers to widen St. Annes-on-the-Sea Pier and erect a concert pavilion at a cost of £25,000. The engineers are Messrs. Garlick & Sykes, of Preston. The pavilion, which will be of Oriental design, is to seat 800 persons.

Electric Lighting at Battersea.—The Battersea Borough Council's Central Electric Generating Station was opened recently. The installation, which is intended to supply about 45,000 lamps of eight-candle power as well as 240 arc lamps erected in the streets, is arranged on the continuous-current three-wire system, with a constant pressure of 460 volts across the outer conductor of the mains. The system has been laid down by the Council's own workmen at a cost of £152,000. Professor Kennedy was the engineer of the system.

Vauxhall Bridge Delay.—The extraordinary delay which has arisen in connection with the construction of the new Vauxhall Bridge will be the subject of an enquiry by the County Council on an early date. The contractors for the sub-structure, Messrs. Pettick Brothers, of Plymouth, have occupied over that portion of the work as long as was taken to build the old bridge in 1816. Their contract expired last March, but there is as yet no sign of an early completion of the work. The contractor's explanation of the delay is that unforeseen difficulties have arisen in the execution of the work, but, on the other hand, the officials of the County Council say that these difficulties are no greater than might have been expected in the construction of a bridge in a tidal river like the Thames.

The Lighting of the Thames Embankment contains some novel features. On the recommendation of the County Council's engineers, the long-burning open type of the Gilbert arc lamp will be used. These lamps take 6ft. of carbon, which greatly lessens the cost of labour for re-carboning; and the inconvenience of using ladders in crowded thoroughfares is avoided by the use of arrangements for lowering the lamps to the ground. The lighting of the parapets was started last February, the existing gas standards being converted for the purpose. As these standards were so close together, lamps taking about half the usual amount of electrical energy, and giving a proportionately small light, were used. Considerable difficulties attach to the use of these small-current lamps, and this is the first time they have been successfully used for extensive public lighting.

The Manchester Tramways were recently taken over by the corporations of Manchester and Salford from the Carriage Co. that worked them. This has now resulted in vexatious delay and disorganisation, which renders ineffective the reduction in fares, and other added advantages do not compensate. As long as the company had the traffic of both of the municipal areas they worked the whole as one concern, and the division between them was ignored, just as Metropolitan omnibus passengers are enabled to ignore the bounds of Westminster from the rest of London. Now that the Salford and Manchester areas are worked separately by their respective local authorities the remarkable fact is disclosed that after some years of negotiation between them on this very question—negotiation from the time, indeed, when they resolved to take over the working of the lines—they cannot come to terms with each other for the continuance of any service across the boundary. Since municipal management began in May and June last the experience of passengers has been that wherever the company's tramway service was disjointed the breach of communications is seriously enlarged, while wherever the service across the boundary was continuous the continuity is destroyed.

Views & Reviews.

A Good Book Badly Illustrated.

This is a most readable addition to the "Highways and Byways" series issued by Messrs. Macmillan. In his tour through the Lake Country the author describes what he sees in a facile manner, with touches of humour, historical notes, art criticism, or literary anecdotes as occasion offers. We are, however, surprised that, though he is at great pains not to miss anything connected with Southey, Gray, Wordsworth and De Quincey, he has not a word to say of John Ruskin, with whom Coniston at least is inseparably associated. The Lake Country is mostly dependent on its own intrinsic beauty, for its story is merely that of a pastoral people who were neither makers of history nor builders of castles and abbeys; and those several poets and writers who added so greatly to English literature were drawn there by the natural beauties of the country and were not indigenous to it. The Lake District includes but few large buildings of importance to the architect, though the archæologist will not lack for objects to interest him. But both will find this book of value to them, whether they have visited the lakes or not. Mr. Joseph Pennell has made a large number of sketches to illustrate the letterpress, but they reflect little to his credit; in fact, we are astonished that an artist of such capabilities and technique should supply drawings the majority of which give one no idea of the beautiful landscape and cannot be held up as models of draughtsmanship. They would be highly interesting in a sketch-book; but this is not a sketch-book. Certainly there are a few exceptions, but the rest are hasty and incomplete "notes"—most disappointing.

McLAREN MEMORIAL CHURCH, LARBERT. JOHN J. BURNET, ARCHITECT.

While referring to the Lake District it is opportune to note that the purchase price of the Brandelhow Estate on the western shore of Derwentwater has been raised, and that, after paying the necessary expenses entailed in carrying out the scheme, there will remain some money in hand to go to a permanent maintenance fund.

"Highways and Byways in the Lake District." By A. G. Bradley. With illustrations by Joseph Pennell. London: Macmillan & Co., Ltd; price 6s.

Arts and Crafts.

In these two lectures, delivered at Liverpool in 1888 before the National Association for the Advancement of Art, we are on the old road. William Morris was a theorist in art, as in socialism, but he was not impracticable like most of his followers, and his common-sense saved him from the superficialities we are at present being nauseated with. His theories (no one would have been more ready than himself to acknowledge that they were mere approximations to the truth or partial truths) have been seized upon with avidity and applied in season and out to pretty well everything by persons who over-estimate their strength and consequently waste their energies, often doing more harm than good. However, after all, they are superior to the opportunists. Morris was never tired of pressing his definition of art as man's pleasure in work, and his philosophy seems almost summed up in this. In the lectures under review he merely reiterated the doctrines of Ruskin, and argued that architecture and art should be put upon a true co-operative basis. His opinions with regard to the part the guilds played in mediæval architecture and its evolution are now being worked out by several of his colleagues and others, but such antiquarian researches, though interesting, are of doubtful utility in the foundation of a true philosophy of art. That the true theory can be built up on *a priori* grounds is, however, apparent, and archæology is waiting for this before it can receive its full interpretation. The book is printed in the Golden type designed by Morris for the Kelmscott Press.

"Art and its Producers, and the Arts and Crafts of To-Day: Two Addresses delivered before the National Association for the Advancement of Art." By William Morris. Price 2s. 6d. nett. London: Longmans, Green & Co., 39, Paternoster Row, E.C.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"*Of course I know that it is better to build a cathedral than to make a boot; but I think it is better to actually make a boot, than only to dream about building a cathedral.*"—("Concerning Isabel Carnaby.")

Raby Castle Chapel. THE chapel at Raby Castle has recently been renovated, and during the work of clearing the walls of a layer of plaster some interesting discoveries were made by Messrs. J. P. Pritchett & Sons, architects, of Darlington. The chapel is the oldest portion of the Castle, dating from the middle of the fourteenth century; and at the west end was disclosed a six-light window of that period, about 14ft. wide and 8ft. high, walled up with solid masonry about 2ft. thick. The sill, bead, jambs, mullions and tracery are in almost perfect preservation. This, in the opinion of the architects, was an open screen, or unglazed window, opening from the end of the chapel into the "Barons' Hall," the side of which abuts on it, and was, no doubt, for the purpose of enabling persons in the hall, or general living-room, to participate in the services which, prior to the Reformation, took place at the altar opposite. On the south side was found a fourteenth-century doorway and a beautiful three-light window of later—probably fifteenth-century—work. This, too, seems to have been an unglazed window or screen between the chapel and a small chamber or pew, such as is frequently met with in the chapels of royal and baronial castles. An ancient two-light window has been opened out in a wall 10ft. 9in. thick. Another discovery is the ancient fourteenth-century "aumbry" or closet for the Sacramental vessels, which has been found nearly perfect in the east wall, to the south of the altar.

A Parisian Commemorative Inscription. MR. SIMONNEAU, the manager of works for the city of Paris, has recently discovered, near the artesian well, the first stone of the old abattoirs at Greville, and the steel plate commemorating their foundation, The inscription engraved on this plate is enough to put the adulators of Augustus Cæsar to the blush: "Under the reign of Napoleon the Great, Emperor of the French, King of Italy, Protector of the Confederation of the Rhine, Mediator of the Swiss Federation, always victorious; on the 2nd April 1810 memorable year! in which the Spaniards were defeated, day still more memorable on which by his union with Maria Louisa of Austria, Napoleon magnanimous Emperor (may God grant him a numerous posterity) re-united two nations long separate, consolidated the peace of the Continent, and laid the foundation of the fondest hopes of France. The first stone of this grand edifice, one of the five abattoirs of the City of Paris was laid by His Excellency Jean-Pierre de Montalivet, Count of the Empire, Grand Cross of the Legion of Honour, Minister of the Interior." In addition to this plate the foundation stone contained an allegorical medal of the marriage of Napoleon and Maria Louisa and a series of coins of the period, which have been transferred to the City Museum.

A Suggestion for Architectural Prizes. THE Prix de Rome in architecture of the French School of Fine Arts for this year has been awarded to M. Hulot, already well-known as a winner of prizes, medals and mentions. The second prize was awarded to M. Prévot. The subject assigned for the competition shows very well the skill of the directors of the school in interesting their pupils and inciting them to think for themselves. It will be remembered that the city of Paris and the French Government are now discussing, not to say disputing over, the disposition to be made of the fortifications surrounding the city. Ever since the brave though unsuccessful defence of these same fortifications against the Germans in 1871, it has been evident to military men that a fortified enclosure around a great city is, as a factor in the defence of the city, worse than useless. It was, therefore, determined a year or two ago to demolish the fortifications of Paris and to sell the vacant territory obtained in this way to the city at a price to be agreed upon. Unfortunately, it proved difficult to agree upon the price; and although the fortifications in the neighbourhood of the Porte Maillot and the Porte Dauphine, where the land obtained by their removal would be most valuable, have already been demolished, it does not appear that an agreement for transferring the territory to the city has actually been concluded. However, a wide strip of vacant land in the most fashionable and beautiful section of Paris has been made available for building, and it is not surprising that the brains of the local architects teem with projects for utilising it. The professors of the School of Fine Arts, interested like the rest in the matter, proposed therefore in the programme for the Prix de Rome competition that this strip should be made the site of a building or group of buildings which, by another concession to the popular fancy of the moment, should be destined to accommodate an American Academy in Paris, or perhaps we should say the American Academy in Paris, steps having already been taken to establish such an institution, on a scale, however, for the present much more modest than that of the Prix de Rome scheme.

The Wolverhampton Exhibition. THE Executive Committee appointed to arrange for the holding of the Arts and Industrial Exhibition at Wolverhampton next year have already accepted a tender for the Industrial Hall, and they have now accepted the tender of Mr. J. Herbert, builder, of Hartley Street, Wolverhampton, to erect the Machinery Hall at a cost of £7,297. It is expected that the hall will be completed in four months' time. It will be an imposing structure, and will stand adjacent to the Industrial Hall. It will be 350ft. in length and 130ft. in width, with a three-span roof. The chief decorative features will face the Industrial Hall. The frontage to the park will be treated in a style similar to that of the Industrial Hall, and inside the visitor will have an unbroken view except for two rows of columns carrying the roof of the centre bay. Arrangements are being made for the erection of a concert hall and other attractive structures, including a Japanese pavilion, as it is hoped that the Japanese Government will in this building be officially represented by a number of products of that country. The time for receiving applications for space was October 1st, and many leading firms are making application for space for a large display. More particularly may be mentioned the manufacturers of electrical machinery and appliances (amongst them being the Electric Construction Co., Ltd.), and builders of the most recent high-speed engines adapted for such purposes. Arrangements have also been made to show in actual work examples of the German water-tube boiler (Durr) and also the new Cahall water-tube boiler, now largely used in the United States. In the industrial section it appears that an exhibit will be made by the leading firms of interior decoration and furnishing which will be of exceptional interest. The inaugural ceremony in connection with the building operations will be performed by the Earl of Dartmouth on October 17th.

Alterations at St. Giles', Cripplegate. UPON the union of the benefice of St. Bartholomew, Moor Lane, with that of St. Giles', Cripplegate, it was decided to remove to the latter edifice a number of historic appointments which formed an interesting feature of the first-named church. Though itself a comparatively modern edifice, St. Bartholomew's, Moor Lane, contained not a few valuable relics which were recovered from the church of St. Bartholomew-by-the-Exchange at the time of the Great Fire. The original church was rebuilt near the Bank in 1438, destroyed by the historic conflagration, and replaced by Wren. Then, the historian informs us, "the materials of the old church were sold by auction in 1841 for £483 15s., the south wall of a chapel being eserved to be built into the Sun Fire Office, as was also some of the carved masonry, the old pulpit, the organ and other woodwork, which were preserved in a copy of the old tower and church erected in 1849-50 by Professor C. R. Cockerell, R.A., in Moor Lane." When it was decided that the Moor Lane edifice should at last disappear for ever, the authorities of Cripplegate obtained a faculty authorising the removal of the several interesting relics to St. Giles'. For some months past the work of re-erection has been in progress by Messrs. W. H. Lascelles & Co., 121, Bunhill Row, under the direction of Mr. F. W. Jackson, the clerk of works, and now it is all but complete. The result of the improvement has been to provide an ante-chapel at St. Giles' to the north of the chancel. Here the reredos from Moor Lane has been placed. It is composed of carved wood, attributed to Gibbons, and contains two coloured panels representing Moses and Aaron. The Communion table is of elegantly figured marble. On the wall to the north of the reredos has been fixed another beautiful specimen of carving, in which are apertures for two panels. The reading desk has also been removed. The tiled floor of this former chancel has been relaid, and the partition rails have been made from the choir stalls in use at St. Bartholomew's. The difficult task of removal has been carefully carried out, and the result is to add in no small degree to the beauty of Cripplegate's parish church. When "the four shoppes" disappear, the Great Fire commemoration window is also to be fitted up at St. Giles'. Apropos of the improvements, it is interesting to note that the same firm have had in hand the re-erection of a licensed house adjoining the church. In order to establish a sound foundation it was necessary to burrow some 27ft. below the chancel of St. Giles'.

A Manchester Architect. WE regret to announce the death of Mr. John Littlewood, member of the well-known firm of Messrs. Mangnall and Littlewoods, architects, of Manchester. Death took place rather suddenly at his residence, Lansdowne Villas, Old Trafford. A native of Holmfirth, Yorkshire, Mr. Littlewood served his articles with Messrs. Travis & Mangnall, architects, of Manchester, and he was engaged with that firm during the erection of many important buildings, including Watts's warehouse in Portland Street. On the death of Mr. Mangnall, early in the 'seventies, Mr. John Littlewood joined his brother, Mr. William H. Littlewood, in carrying on the business, retaining the style of Messrs. Mangnall & Littlewoods from that period. Under that title Messrs. Mangnall and Littlewoods have carried out many designs for public buildings, and they can show an interesting record of prizes won in keen competition. For example, the two brothers obtained the prize of £500 for their design for the Manchester Corporation Gasworks in Bradford Road. That was so far back as 1878; but coming to a more recent period, they designed the Campfield Markets, the Salford Corporation baths at Broughton and Regent Road, the new schools and homes for the Chorlton Union Board of Guardians at Withington, and other public institutions. During the past few years Messrs. Mangnall & Littlewoods have been conspicuous in the erection of piers and concert pavilions at various health resorts. Morecambe Pier and Concert Pavilion and the Empress Ballroom at Blackpool are instances of their art and skill in this direction. Mr. Littlewood was a member of the Manchester Society of Architects, and was elected an Associate of the R.I.B.A. in 1882 and a Fellow in 1888.

A Leeds Competition. NEW premises for the Leeds Public Dispensary is to be erected on Hartley Hill. Designs for the new building were sent in last week by seven competing local architects, namely, Messrs. Bedford & Kitson, Mr. W. S. Braithwaite, Messrs. Chorley, Connon & Chorley, Messrs. W. A. Hobson & Co., Messrs. Perkin & Bulmer, Messrs. Smith & Tweedale and Mr. W. H. Thorp. The site has a frontage to North Street as well as to Hartley Hill, but the latter thoroughfare will display the chief architectural features. Each competitor has sent in a full set of plans, and a cursory examination suggests that complete accommodation has been provided for waiting patients, for the medical and surgical staff, for administration and for the resident officers. When the final selection will be made is not yet known.

CATHEDRAL COURT, GLASGOW.

SOME HOUSING EXPERIMENTS IN GLASGOW.

THE housing problem has long confronted the citizens of Glasgow, but the conscience of the city was specially stirred about twelve or thirteen years ago, mainly by the powerful appeals of Dr. James B. Russell, at that time the medical officer of health for the city. A commission of clergymen and laymen then investigated the actual conditions of slum life, one result of which was the formation in 1890 of the Glasgow Workmen's Dwellings Co., Ltd., with a capital of more than £40,000. The company (whose registered office is at 137, West George Street, Glasgow) set themselves to afford some "object lessons"—first, in building simple and sound houses; secondly, in improving the structure and the management of dilapidated slums: the whole to be let at rents within the reach of the labouring classes.

Ten years have since come and gone, and it seems fitting that the results should now be reviewed.

The general results may be thus summarised: The capital subscribed has been fully invested; two sites, one in the north and the other in the east of the city, have been bought and six large blocks of new buildings erected on them; twenty-six blocks (or tenements) of neglected and dilapidated houses—hot-beds of disease and crime—have been purchased, twenty-one of which have been radically and thoroughly renovated and converted into decent homes, while work has been commenced upon the five remaining blocks recently acquired. The company now owns 677 houses, and when the work on hand is completed it will have an annual rent-roll of nearly £4,800 and will shelter more than 2,900 persons. It has for years paid a steady dividend of 4 per cent. to its shareholders, besides accumulating £1,950 of reserves and undivided profits.

As the first experiment it was resolved to erect very small houses, mostly of two rooms, and ascertain the result of letting them at a scale of rental approximately the same as that of the houses in the overcrowded slums surrounding the site selected. Suitable ground in Rottenrow was purchased in 1891 at a cost of £1 per sq. yd., but, through the delay in obtaining official approval of the plans in respect of open balconies and other novel details of construction, it was not until June, 1893, that the blocks were completed, at a cost of £7,756.

This property has been named Cathedral Court, and the illustration on this page shows the class of houses which have replaced the filthy hovels of Rottenrow. The ground covered by buildings is 538 sq. yds., or 50 per cent. of the whole.

Each of the two blocks is built of brick, rough-cast or "harled" on the outside, with hollow walls and concrete lintels, sills, stair-steps, &c.; there is also a flat roof for drying purposes. The property is planned to afford as many plain simple two-roomed houses as possible, with the aim of overcoming the objections to one-roomed houses occupied by a family. Out of the fifty-six houses in the block eight are of one room and forty-eight are of two rooms. The cubic contents are: Single rooms (with the exception of one large house on the ground floor), 1,200 cub. ft.; two rooms, 1,800 cub. ft. The ceilings are 9ft. high.

Each house is fitted with bed frames, kitchen range, grate, dresser, coal-box, gas fittings and water supply, with the use jointly with one other tenant of a water-closet on the balcony. There is a dust shoot on each floor and washing-house on the top floor leading on to the drying court on the roof.

The cost of the buildings is equal to 6d. per cub. ft. overhead, calculated as follows: From the bottom of the foundations to the head of the walls and halfway into the roof where it is a pitch roof; where it is a flat roof, to the top of it; where there are balconies the whole width of the balcony is included; where the foundations are not level the average level is taken.

The rents paid by new tenants are as follows: Two rooms, 3s. 2d. per week; one room, 1s. 10d. per week. This includes water, stair gas, and all taxes, including those generally paid direct in Scotland by the tenant to the rating authorities.

For some years after the completion of Cathedral Court the company's building operations were suspended, largely from uncertainty as to the policy of the Glasgow Corporation in providing much-needed housing accommodation for the labouring class. The demand for simple low-rented houses being, however, almost entirely ignored by private enterprise and met by the Corporation only to a very limited extent, the directors purchased ground with old buildings near Bridgeton Cross, the eastern centre of the city. Blocks known as Greenhead Court (see accompanying illustrations) have been erected on the site. Nearly all are on the balcony system, and the plans follow the model of Cathedral Court, but afford greater variety of house in size, style and rental. No tenants, however, in any of the blocks which have been built by the company occupy houses larger than two rooms. The cost of Greenhead Court is not yet finally ascertained, but is expected to be about £19,500. This works out at 5½d. per cub. ft. overhead, calculated as in the case of Cathedral Court.

The dilapidated buildings which have been selected for reconstruction are in four groups, each in a different district of the city. When purchased they were still sound in their main structure, but completely neglected and worn out in their internal fittings, more particularly the woodwork and plasterwork. The plumberwork, where it existed at all, was worse than useless. The houses were of course overrun with vermin and encrusted with filth.

The general result of the reconstructions has been exceedingly satisfactory. The rate of return has been considerably over 4 per cent. on the whole cost after providing for depreciation and repairs.

The first experiment in reconstruction was with four blocks in the east end, formerly the centre of much rowdyism, now known as George Court, and beautified by trees planted by the Gardening Section of the Glasgow Kyrle Society.

As the result of the wonderful improvement effected, the medical officer of health for the city appealed to the directors to acquire and renovate four tenements in a short narrow street on the south side of the river known as Bolton Street, which had become a byword for riotous outbreaks and notorious as a hotbed of fever.

The tenements were acquired and overhauled, and now not only has the character of the buildings been altered, but, with consent of the authorities, the very name of the street has been blotted out and it is now known as Ardgowan Place.

In the autumn of 1898 the directors resolved upon an extension of the work of renovation. Three disgraceful tenements in Brown Street, Port Dundas, were acquired and transformed into Dundas Court.

Attention was then directed to Middleton Place, off Carngad Road, in the north-eastern district, a locality bearing a most unenviable reputation for disease and disorder.

As the street itself is narrow—little more than a lane—the directors have taken over at a nominal price sufficient ground for the extension of the back courts of no fewer than fifteen tenements which have been purchased, comprising all the upper part of Middleton Place. The work upon ten of these is completed.

It may be of interest to note that latterly the work of renovating has been done to the satis-

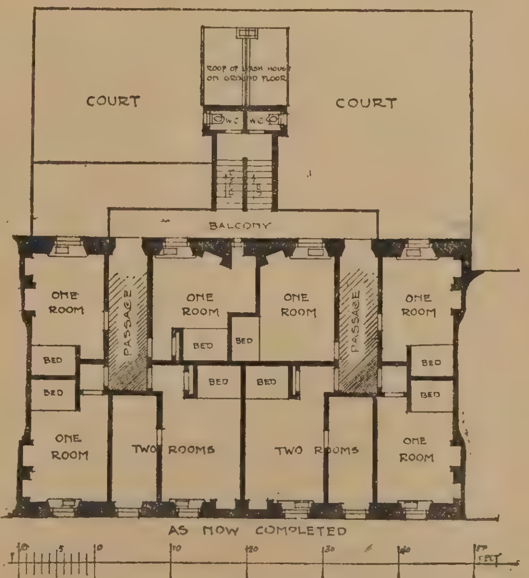
AS ALTERED FOR SANITARY DEPT



AS NOW COMPLETED

NO. 21, MIDDLETON PLACE, GLASGOW.

GREENHEAD COURT, GLASGOW, AND ITS SURROUNDINGS TO THE NORTH.

faction of the company's architects (Messrs. John Burnet & Son) by a working foreman and staff of men employed directly by the company under the supervision of Mr. Biggar, the assistant secretary. It was found impossible to do work of this character satisfactorily through contractors, while on testing the costs by independent measurement a substantial saving is shown. The repairs are also executed by the company's men.

Tenement No. 21, Middleton Place forms an example not only of the company's work but also of the rising standards of sanitary science. The accompanying three plans show that when the property was first built, probably about forty or fifty years ago, all the houses on each flat entered from a passage 44ft. long and completely dark, running along the centre of the tenement. Access to this centre passage was obtained from an entirely dark "lobby" leading from the stair. These two dark passages together took the shape of the letter T. The disastrous effect upon the cleanliness and health of the tenants can be imagined. The only convenience then for the use of the inmates of the thirty-four houses was one privy or dry-closet in the small court.

Owing to the persistent outbreaks of typhus and other infectious diseases, about twenty years ago the medical officer insisted upon the proprietor sacrificing eight small rooms and breaking through inlets for light and air at the ends of each internal passage, but the common privy remained. The alteration is shown in the second plan. The result, however, was still unsatisfactory. When the company acquired the property it was impossible to get access to the houses without groping along to the doors in pitch darkness; so that after very careful consideration the company determined to reconstruct the whole access to the houses by demolishing the old turret stair, building a substantial modern staircase, with balconies right and left giving access to the houses, and adding of course well-ventilated water-closets. In this way the internal "lobbies" have been entirely done away with, and the space they formerly occupied has become habitable, all as shown on the third plan. The cost of this reconstruction has been exceedingly heavy, but it is gratifying to know that the return from the property so far as can be seen at present will not fall below 4½ per cent.

Altogether the company have been exceedingly successful, and are to be congratulated on the very practical way in which they have solved the problems under consideration. One hears so much chatter nowadays about the housing problem that it is a relief to turn to such accomplished experiments as those which have been so satisfactorily made by the Glasgow Workmen's Dwellings Co.; and in conclusion we may note that their work is not altogether confined to its commercial side, as club-rooms have been instituted in each of the properties to afford the tenants some opportunities of social intercourse.

GREENHEAD COURT, GLASGOW.

A Comparative Criticism.

In connection with the foregoing it is interesting to note the interim report which has just been issued by the deputation of the Housing Committee of the Liverpool Corporation who recently visited Glasgow to inspect the Corporation tenements in that city preparatory to drawing up a scheme of artisans' dwellings for Liverpool. They state that the Glasgow tenements are occupied by a class much superior to that which will have to be provided for in Liverpool, Glasgow not having so far attempted to provide for the very poor. The deputation note that one water-closet is provided for four tenements, and all refuse and ashes have to be carried down to ashpits on the ground floor, and in the case of Haghill tenements one ashpit serves sixteen tenements, and no separate yard-space or separate sculleries are provided. All this is in contrast to what has been insisted upon by the Local Government Board in Liverpool, and they consider that to copy Glasgow would be a retrograde step. The deputation do not approve the Glasgow system of filling up floors with dry ashes to render them soundproof, preferring concrete floors and iron joists. Those of Glasgow, it is contended, tend to harbour vermin. On the whole the tenements of Glasgow are good substantial buildings, but the wooden floors did not commend themselves to the Liverpool deputation.

Law Cases.

A Huntingdon Builder's Speculations.—At the Peterborough Bankruptcy Court recently the public examination was held of Frederick Bayliss Thackray, builder and contractor, residing at St. George's House, Huntingdon, and carrying on business under the style of F. B. Thackray & Co. at Ermine Street, Huntingdon. The statement of affairs showed liabilities expected to rank £13,154 15s. 7d., and assets £5,738 19s. 9d., leaving a deficiency of £7,415 15s. 10d. Debtor alleged as the cause of his failure losses through paying his brother Osborne's debts, the failure of Harvey & Williams, Ltd., and inability to realise shares in the Otto Brake Co., Ltd. The public examination will be formally closed on October 18th.

Liability for Timber: An Interesting Case.—In the City of London Court recently the assignee of Mr. William Purkis, timber merchant, sued Messrs. Nicholson & Son, 105, Cheapside, for £68 7s. for timber supplied. Plaintiff's counsel said that the defendants had been building sixteen houses, in Brook Road, Walthamstow. They entered first of all into a contract with one Palmont, sen., who was unable to carry out the contract. In January last they entered into a contract with Palmont's son, by which they undertook to pay him the sum of £1,600 for the completion of the houses. As the young man had neither capital nor plant it was obvious that he could not carry out the agreement without being financed. Palmont, jun., was paid weekly wages for carrying out the work as the foreman bricklayer for the defendants. The plaintiff's case was that the timber now sued for was ordered by Palmont, jun., on the authority of the defendants. The defendants' case was that Palmont, jun., agreed to finish the houses for £1,600. The orders for the timber now sued for were given by Palmont and not by the defendants. There was no truth in Palmont's story that he had been paid weekly wages and that he was acting as the servant of the defendants. He had received £1,800 in all for carrying out the contract. It was true that the defendants had guaranteed some of the orders which Palmont gave, but in all those cases they had paid the accounts themselves. No such guarantee was given in the plaintiff's case and no liability was resting upon the defendants. The deputy judge delivered judgment at great length, and said that the case was one of considerable importance, not only because of the amount in dispute but because of the principles involved. The defendants' contention was that the work performed by Palmont had been done under a contract, and that being the case the timber must be paid for by him. The deputy judge said he could not hold that there was a contract at all. It was true that an agreement had been prepared in solemn form, and that it was sent to Palmont for approval by the solicitors, who were brothers to the defendants. He did not think that Palmont had the ability to understand the matter at all. In his view Palmont was not an independent contractor, and the relationship between the defendants and him was that of master and servant. That being the case, judgment must be entered for the plaintiff for the amount claimed.

The International.—The International Society of Sculptors, Painters and Gravers, whose exhibition opened last Monday at the Institute, is a non-academical, if not actually an anti-academical, body of artists, one of whose moving spirits is Mr. Whistler.

Masters and Men.

The Bricklayers' Strike at St. Albans appears to be gradually dying out, and the fact that the strike secretary has returned to work on the terms offered by the masters when the strike was threatened must have a damaging effect on the position of the strikers.

"The Law relating to Labour Unions" is the title of a pamphlet which has just been published by the Employers' Parliamentary Council, 7, Victoria Street, Westminster; price 6d. It deals with the legal liabilities in connection with picketing, coercion and intimidation; the right to sue and be sued, and the consequent liability of union funds as laid down by recent judgments.

A Meeting of Plasterers' Apprentices was held recently at the Club Union Buildings, Clerkenwell Road, E.C., upon the initiative of Mr. Cale, secretary of the Plasterers' Union. Dr. Garnett, principal of the Northampton Institute, advised the young men present to attend the classes at the polytechnics. They would soon discover that there was a great deal more in the plasterers' craft than they imagined. The foreigner was rapidly ousting the English workman on his own ground, because the Englishman neglected to study the technicalities of his trade.

A Serious Labour Dispute exists at the yard of Messrs. J. F. W. Wilson & Sons, timber merchants, of Sunderland, the cause being that a waggon man did a journey to Newcastle and Shields in a shorter time than the firm's other three waggon men. These demanded the instant dismissal of the quicker man. The firm would not be dictated to, and refused to comply with their request. The three men thereon left work and induced about thirty others, mostly labourers, to do the same. A new man was set to work by the firm, and he was found unconscious near the timber yard, having apparently been attacked by a number of the workmen. He had to be removed to the hospital, where he gradually recovered. The men on strike are mostly members of the Gasworkers' and General Labourers' Union. Some have resumed work.

Labour in the Colonies.—The Emigrants' Information Office, 31, Broadway, Westminster, S.W., state that it is too late in the year to emigrate to Canada in search of employment. In New South Wales the strike of the ironworkers' assistants, which lasted some weeks, has been settled by reference to arbitration; the men demand a uniform wage of 7s. a day, and the employers decline to give that wage to any except first-class men, others to have 6s. The building trade is brisk, and there is a continued demand for plumbers and competent labourers. There is practically no demand for labour at Hillston, Newcastle, Lithgow, Bulli, Young, Mudgee, Wilcannia, Walgett or Bourke. In Victoria the various boards appointed under the Factories and Shops Acts have determined that the lowest wages to be paid to glaziers in the plate-glass trade should be 10½d. an hour. There have been demonstrations of the unemployed in Melbourne, though it is often difficult to procure competent workmen. In Castlemaine, Bendigo, Daylesford, &c., there is no demand for labour. In South Australia the supply of local labour is sufficient. Queensland is still suffering from the drought, and emigrants are not recommended to go there at present, unless they receive nominated passages or take a little money with them. In Western Australia the report of the Government Labour Bureau for the quarter ending the 30th June last shows as follows: There is a demand for competent mechanics in the building and other trades at Northam, Perth and Dongarra, and for sawmill hands at Albany, but otherwise the supply in the colony is quite sufficient, and in some places the supply is in excess of the demand. The last reports from New Zealand show that the building and engineering trades continued busy almost everywhere. In Cape Colony there is officially stated to be a demand for thoroughly skilled mechanics in the building trades. Otherwise all persons are again warned against going to South Africa at present in search of professional or manual work unless they have ample private means to meet the very high cost of living, or have engagements to go to. They will not as a rule be allowed to proceed up country.

Builders' Notes.

Mr. T. Verge, builder, &c., of Bridge Road, Southampton, died recently.

Mr. Edwin Jennings, a builder and carpenter, of 128, The Grove, Hammersmith, died recently at the age of sixty-six years.

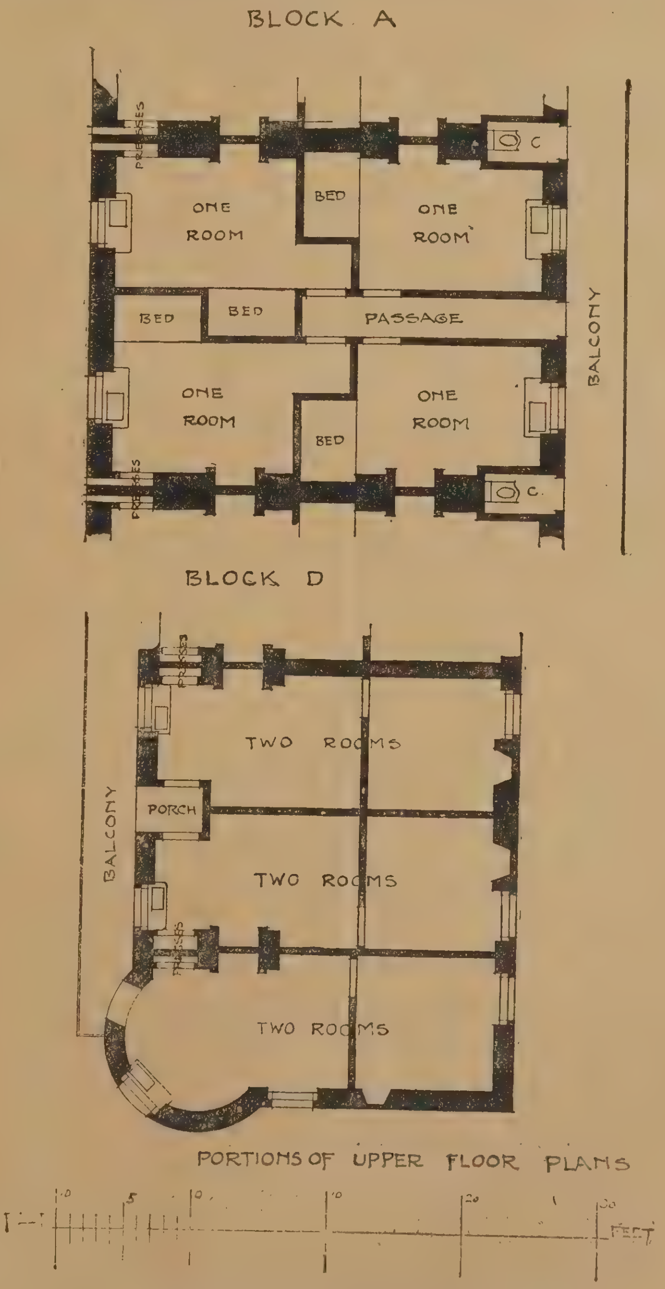
Mr. Thomas Wellman, a builder, of Fordington, died recently at the age of seventy-five years. His son, Mr. Thomas Lewis Wellman, will carry on his father's business.

Mr. Matthew Travis, a builder, of 37, Gardner's Row, Liverpool, died recently. He was connected with the firm of Roberts & Robinson, builders and contractors, for over fifty-seven years.

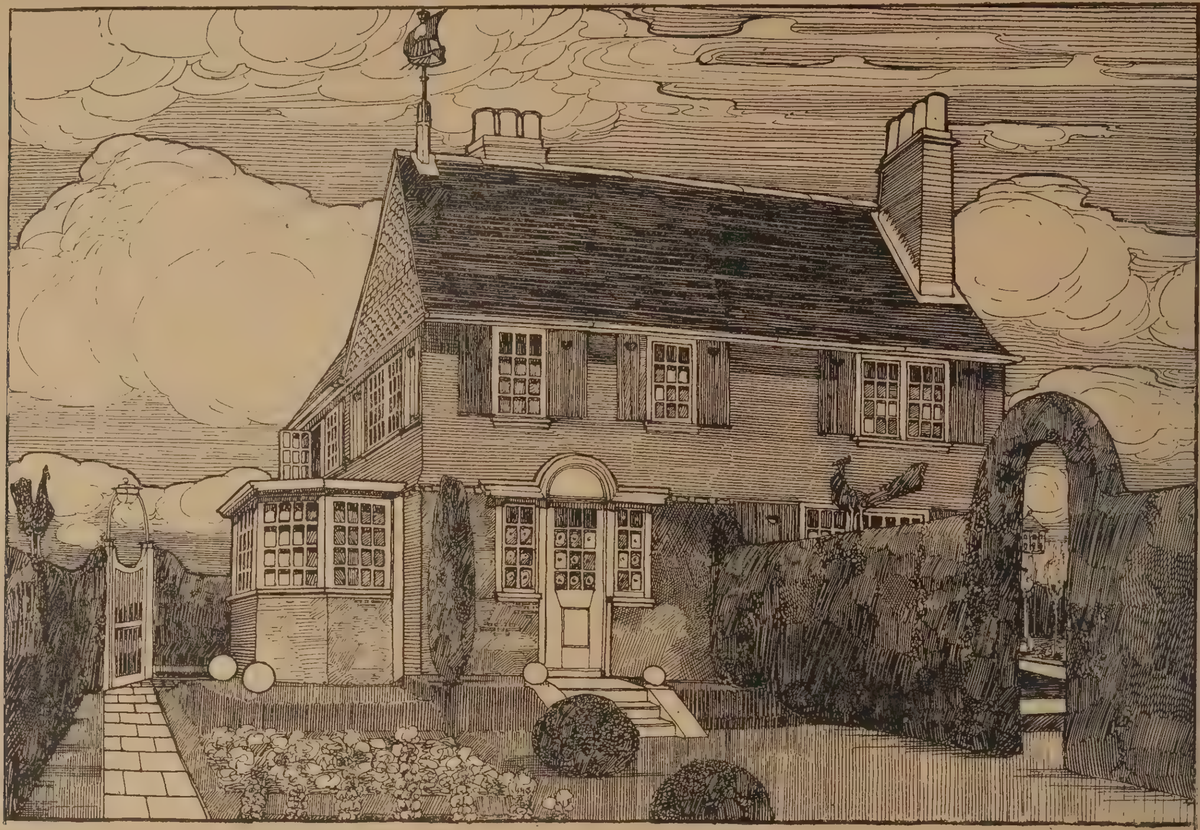
Fire from Lime.—Last Friday smoke was noticed issuing from the buildings of the new Congregational Church at Cricklewood now in course of erection. A fire-engine soon extinguished the flames. The contractor's lime had ignited through the rain leaking through a tarpaulin, and forty bags of lime were destroyed.

The Stock Brick Trade.—The Kent and Essex Brickmasters and Flint Merchants' Protection Association has lowered the price of stocks 4s. a thousand, and has given notice that "on and after October 11th the advance hitherto paid in freights will be taken off, and the freight paid will be according to the Association lists. This removes the last of the advances made to the brick-makers and barge-masters four years ago, when good prices were ruling. The barge-masters received an advance of 3d. per thousand on the freights at that time, but the advances to the brick-makers were taken off last year. The present reduction will affect practically all the barges engaged in the Kent and Essex brick trade. In the Sittingbourne and Milton district, for the first time for several winters, men are being "stood off" from their employment; and in other districts barges are being laid up for the season.

Distinction for the British Fire Prevention Committee.—Official intimation has just reached Mr. Edwin O. Sachs, chairman of the British Fire Prevention Committee, that a large silver portrait medal accorded by her Majesty the German Empress in connection with the Fire Congress of June last has been presented to the executive of the committee as a mark of appreciation for the services rendered by that body in the demonstration of scientific and economic aspects of fire-protection. It will be remembered that a deputation of the committee comprising Mr. Edwin O. Sachs (chairman), Mr. Ellis Marsland, Mr. F. R. Farrow and Mr. C. E. Goad, accompanied by the secretary and engineer, visited Berlin in the summer, and that an important exhibit of technical models and photographs was loaned to the German authorities for the exhibition held in connection with the Congress.



PLANS OF TENEMENTS IN GREENHEAD COURT, GLASGOW.



COTTAGE AT FARNHAM, SURREY. HERBERT FALKNER, ARCHITECT.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Bending Moment on a Beam.

MANCHESTER.—CONSTANT READER writes: "How can I determine the greatest bending moment on a beam supported at both ends and carrying a distributed load? Rivington (p. 156) works out an example, the formula being $\frac{wl^2}{8}$, whilst other authorities use the formula $\frac{WL}{8D}$. Why are these two (apparently) different formulæ used? What is the relation between them, and whichis the better for practical use? I should also be glad to have a plain common-sense definition of the term 'moment of inertia,' and of what use it is practically."

In the formulæ quoted $w =$ distributed load per ft. run; $W =$ total load, l or $L =$ span; therefore $\frac{WL}{8} = \frac{wl \times l}{8} = \frac{wl^2}{8}$, and either may be used to produce the same result. When D (depth) is inserted in the formula the result is maximum stress in flange instead of bending moment. The maximum bending moment on a beam with a distributed load will be at the centre, and may be found as follows: Let A B be a beam carrying a uniformly distributed load W per ft. run over the span l. Then the total load will be wl and the reaction at A and B $= \frac{1}{2} wl$. The upward reaction at A by $\frac{1}{2} l =$ the positive moment at centre of span. Against this is half the load ($\frac{1}{2} wl$) acting at its centre of gravity ($\frac{1}{4} l$) acting downwards in opposition to the reaction = the negative moment at centre of span. Then the bending moment $= \frac{1}{2} wl \times \frac{1}{2} l - \frac{1}{2} wl \times \frac{1}{4} l = \frac{1}{4} wl^2 - \frac{1}{8} wl^2 = \frac{wl^2}{8}$. The moment of inertia of a section is the summation (or total) of the areas of all the individual fibres (or particles) multiplied by the squares of their distances from the neutral axis. Practically, the moment of inertia gives the value of the section in resisting stresses. A flanged beam has a greater moment of inertia than a solid rectangular beam of the same sectional area, because a greater proportion of the material is at a distance from the neutral axis.

HENRY ADAMS.

Government Surveyors.

LONDON, N.—SURVEYOR writes: "To whom should I apply for an appointment as assistant in the quantity surveyor's department in any of the Government offices, such as the War Office, London County Council, &c.?"

See reply on p. 165 of our issue for April 3rd last.

Examinations for Municipal and County Engineers and Surveyors.

SEAFORTH.—M. I. writes: "Where are the examinations of the Municipal and Sanitary Surveyors' Institute held, and where can I obtain a syllabus?"

Querist does not give the proper name of the association he means. The address of the Incorporated Association of Municipal and County Engineers is 11, Victoria Street, Westminster, S.W.; that of the Sanitary Institute, Margaret Street, London, W.; and that of the Surveyors' Institution, 12, Great George Street, Westminster, S.W. Application should be made to the secretary in each case.

Reflection in Shop Window.

EARLESTOWN.—ANXIOUS ONE writes: "A showroom window facing a main street is rendered almost useless by the reflection of passers-by and of objects on the other side of street. The window bottom is 2ft. above the road and the show-board is about 14ft. wide (from the glass), surrounded on the other three sides by a dark curtain. The light only comes through the plate-glass window in the front, yet an article cannot be distinctly seen from the street at any time during the day, and especially when the sun is shining. What is the cause of this reflection, and how can it be remedied?"

The cause of the reflection is that the background is too dark; and we may instance in this connection the difficulty of looking out of a window when the outside is dark and the inside brilliantly lighted, or the corresponding ease when the conditions are reversed. The defect can be remedied by either casting a shade on the front of the window or by making the background light. If the side curtains can be removed and a sidelight thrown from the back it would be still better.

Architectural Draughtsmanship.

GLASGOW.—EXHIBITION writes: "Where can I obtain inexpensive books on (1) hints on draughtsmanship, (2) glosssary of architectural terms, (3) method of drawing perspectives of buildings?"

(1) "Hints on Architectural Draughtsmanship," by G. W. Tuxford Hallatt (price 1s. 6d.; E. & F. N. Spon, Ltd.); "Architectural Drawing," by R. Phené Spiers (price 10s. 6d.; Cassell & Co., Ltd.). (2) The best general glossary of architectural terms appeared in "Specification: No. 3" (published from these offices, price 5s. nett). (3) "Linear Perspective," by G. A. T. Middleton, A.R.I.B.A. (price 1s.; B. T. Batsford).

Maker of Patent Ladder.

NORTHWICH.—J. A. B. writes: "Do you know the address of the maker of a patent ladder which has an iron rod running through the wood spindle, screwed and riveted tight on the outside? I bought one at the Liverpool show two years ago."

We regret we are unable to furnish our correspondent with the desired information. We understand that a Mr. Baker organised a building trades' exhibition at Manchester last year and at Liverpool the year before, but this is not *the* Building Trades' Exhibition, which is always held at the Agricultural Hall, Islington.

P.C. Items in Bills of Quantities.

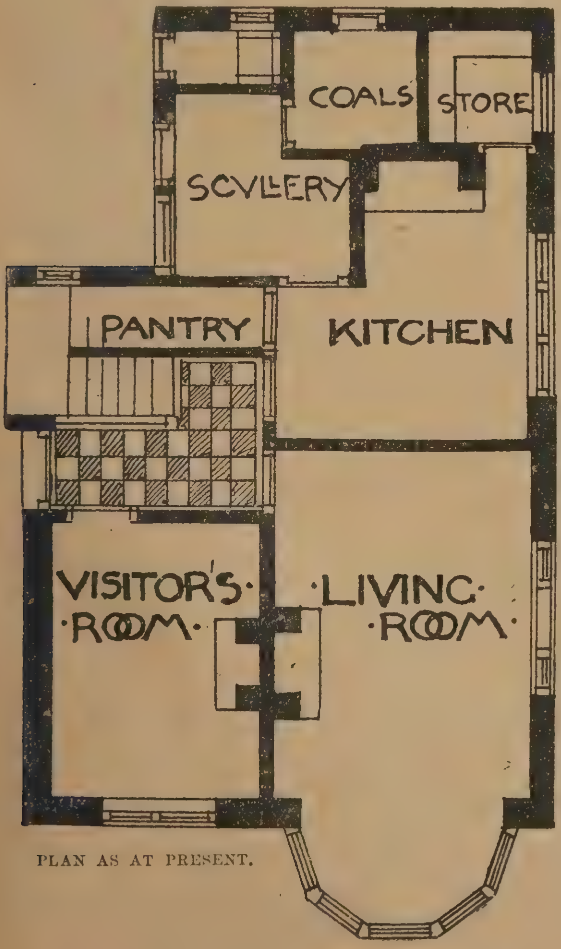
CARDIFF.—OMEGA writes: "In a bill of quantities I have put several prime cost values for materials and fittings to be selected by myself, including hot-water apparatus with an item attached 'Allow for profit and waiting upon same.' I find that the contractor whose tender is accepted has put nothing against the latter item. Can he now charge me for waiting upon and making holes, &c., for the hot-water engineer?"

This raises the eternal question: "What is 'Prime Cost'?" Our correspondent's interests will be protected if he has a clause in the contract or specification to the effect that the contractor is to do everything necessary to the completion of the building without extra charge; or, if the contractor has priced a general item in the bill of quantities, allowing for waiting upon all trades; or if the contractor has given a lump sum for the entire job on a special form of tender. If, however, the quantities were somewhat in the nature of a schedule of prices the question is a debatable one. In any case you should always require the builder to send the priced quantities to the quantity surveyor to be examined by him and sealed before accepting a tender finally, to ensure that every item is priced. The contractor often neglects p.c. items, as he generally reckons on being allowed to order the goods himself and obtain special discounts of which the architect is ignorant. We know of one large firm of contractors that used to send round to the firms that supplied special articles such as water-closets and hot-water fittings, with whom they had large dealings, to inform them that the architect would be calling or sending for quotations in a few days for special goods, and they must reserve 10 per cent. or more for the contractors out of the price they quoted him. Thus, the firm very often made as much as 25 per cent. profit on p.c. items—10 per cent. from the architect and the rest from the merchants. The only satisfactory method of preventing this is for the architect to order and pay for the goods himself, but he must make this clear to the contractors when tendering. If he cannot do this, he should allow the contractor to order the goods, avoiding as many p.c. items as possible.

Society of Architects' Examinations.

Newport, Mon.—D. I. L. writes: "What books would you recommend for the M.S.A. examinations; also, where could I get a list of coaches for this examination?"

Mr. B. T. Batsford, of 94, High Holborn, W.C., will supply you with a most useful list of standard books on the various subjects in the examination, and you can choose from it. The names of several coaches will be found in our advertisement columns.

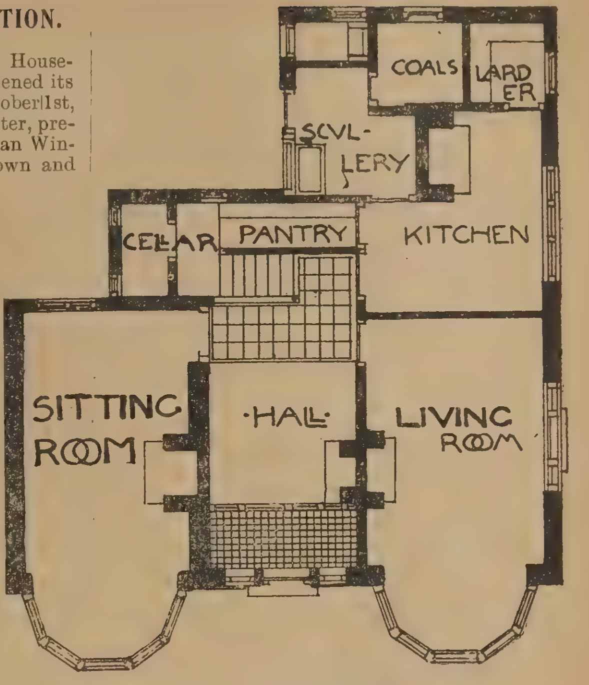


PLAN AS AT PRESENT.

HOUSE DECORATORS' ASSOCIATION.

The National Association of Master House-Painters and House Decorators opened its eighth annual convention on Tuesday, October 1st, at Leicester. Mr. J. W. Barker, of Leicester, presided. The Mayor of Leicester (Alderman Windley) welcomed the Association to the town and congratulated them on their successful efforts to raise the standard of decorative art. Mr. T. W. Latto, president of the Master-Painters' Association of Scotland, and Mr. J. Sibthorpe, vice-president of the Irish Association, also spoke of the excellent work which had been accomplished. Sir J. Rolleston, M.P., then opened an exhibition of decorative art and of the work done by apprentices of members of the Association in competition for the awards offered. He said one of the most notable features in the progress of the industries of this country was the great improvement in the art of house-decoration. This was not only observable in the mansions of the rich, but in the houses of the people and in the places of amusement to which they resorted. All round there was great advance in taste and refinement, and that was in great measure due to the skill and brains of the members of their Association. The annual report stated that sixty members had been added during the year, while branch associations had been opened at Loughborough, Macclesfield and Halifax.

The meeting was resumed on Wednesday. Mr. H. Looke, of Hull, read a paper on "What to Teach our Apprentices," in which he advocated the extended use of good handwork instead of manufactured ornament. He urged the importance of drawing combined with technical and chemical knowledge. Mr. Walter Crane then read a paper on "Some Thoughts on House Decorations." The domestic interior, he said, afforded the best visible evidence both of the standard of living and refinement and of the sense of beauty of any age or country. In proportion as the conditions of human life became more and more artificial and removed from nature, man seemed to require the aid of art. Decoration, indeed, might be regarded as a sort of æsthetic compensation for the increased artificiality, complexity and restraint of civilised life. The decorative designer certainly depended largely for freshness of inspiration and suggestion in design and colour upon growing plants and flowers, upon the sight of birds and animals, upon the ever-changing sea and sky, and upon the colours of the landscape. The practice of living in flats and residential hotels involved a contraction of space and light that could not have a favourable physical effect or foster a healthy sense of decoration. On the other hand, the collective dwellings of which they saw the germs in the better type of modern flats, with a common kitchen and dining hall, might have an important future; and there was no reason why, given favourable conditions, dwellings on the plan of collective living or collective homes should not have dignity and beauty as well as the comforts of a home. From the decorator's point of view the plan and scale of such collective dwellings might afford fine scope for art. Whether inside or outside, the town house required constant cheering up by the painter and decorator, but it must be the decoration that cheered and not inebriated. He was glad that a determined effort was being made to return to simplicity in house-designing, furniture and decorations. Mr. Fletcher, head-master of the Leicester School of Art, afterwards read a paper on "The Value of Design and Reticence in Decoration." Mr. Graham Cole, of Newcastle, was elected president for the ensuing year.



FUTURE EXTENSION.

Keystones.

Death of Mr. James Brooks.—At the moment of going to press we learn with deep regret of the death of Mr. James Brooks, F.R.I.B.A., the well-known church architect. A biographical notice will appear in our next issue.

A Balmoral Memorial to Queen Victoria.—The movement to rear a granite obelisk to the memory of Queen Victoria, which has been discussed for some time past among the tenants on the Balmoral estate, has received the approval of the King. The exact terms of the inscription on the base have not yet been decided.

The Parish Church at Whittington has been reopened after alterations and improvements, including re-seating throughout, the repairing of the wood-block pavements, and the provision of new kneeling-rails throughout. The improvements have been carried out by Mr. Thomas Sanderson, of Whittington, at a cost of about £275.

The Sale of Battle Abbey.—With reference to the prospective sale of Battle Abbey, Mr. Hamilton Hall, F.S.I., intimates that at the next meeting of the Sussex Archæological Society he will propose that a fund be raised for purchasing the building as a county museum and library. Lord Rosebery has also been mentioned as a probable purchaser.

A Queen's Memorial in Rhodesia.—The people of Salisbury, Rhodesia, have resolved that the Victoria Memorial for the province of Mashonaland shall take the shape of a museum and library, and, if funds permit, a public hall. A strong minority of the subscribers favoured the erection of a statue of the late Queen, and a novel feature is the keen interest taken in the matter by the natives, who are subscribing to the fund.

The Architectural Association of Ireland.—In their report on the session 1900–1 the Committee express disappointment at the lack of interest taken in the numerous prizes offered for competition by the Association. Only one set of drawings was submitted for the travelling studentship, and the whole of the other prizes competed for were taken by two students. One of the most important features of the past session was the series of technical demonstrations suggested by Mr. Frederick Batchelor, F.R.I.B.A., which consisted in visits to various building and other workshops. Such a scheme is highly profitable to students, as it gives them a practical grasp of their work. The total membership of the Association is now 128, and the statement of accounts shows a balance to the good of £64 5s. 10d.

Hampsthwaite Church is about to be restored.

The Collegiate School for Girls, Bournemouth, has been enlarged by the addition of a new wing, comprising a commodious gymnasium and six class- and bed-rooms.

Alyth Y.M.C.A. New Hall was opened recently It has cost £1,150. The buildings are situated in Commercial Street. There is a hall capable of seating 120 persons, and is also fitted up for a gymnasium. There are also a reading-room, public bathroom, lavatories and caretaker's house on the premises.

Much Bricklaying.—In connection with the memorial stone laying at the new Temperance Hall at Lincoln recently there was a bricklaying ceremony, when nearly 300 members of the Temperance organisation each laid a brick, and contributed 5s. to the fund.

Victoria Memorial Windows.—New Queen Victoria memorial windows have been erected in St. Nathaniel's Church, Cotham. There are three windows of two lights each. The work has been carried out by Mr. T. Griffiths, of Easton Road, Bristol.

Mr. William Watson, a well-known West Riding architect, died last week at Wakefield. Deceased, who was sixty years of age, was one of the surveyors of dilapidations for the Wakefield diocese and a prominent member of the Wakefield Chamber of Commerce and Shipping. He had for many years been one of the principal architects of Wakefield, and had prepared many plans for churches, chapels, schools and other public buildings, his latest work including the designs for the Wakefield Workhouse Infirmary, and the new Board schools at Lofthouse Gate opened last Saturday week.

The Site of Ninevah.—Mr. Leonard King has left London on behalf of the British Museum for the purpose of inspecting the mounds at Konyunjik, the traditional site of part of the city of Ninevah, and reporting on their condition. It will be remembered that this was the scene of the excavations and discoveries of Sir Austen Layard (1845–7, 1849–51), of Mr. Hormuzd Rassam (1854) and Mr. George Smith (1873-6). As the result of their labours the general outline of the city was brought to light, the ruins of four palaces were discovered, and in thousands of clay tablets was found the great library of Asurbanipal, the greater part of which is in the British Museum.

At Sturminster Newton Church a screen has been erected to the memory of the late Mr. Dashwood, who was for over thirty years churchwarden, in the eastern bay in the north transept, and thus divides the organ chamber from the main portion of the ancient fabric. It is made entirely of well-seasoned and carefully selected English oak, and is carried up the full height of the pointed arch which forms the bay. The screen is of fifteenth-century character, to harmonise with the immediate surroundings. It has been carried out—from the designs and under the direction of Messrs. Dunn & Ingledew, architects, of Gateshead—by Messrs. Harry Hems & Sons, of Exeter. The new screen is carried up by five uprights, thus dividing it into four distinct portions. These are panelled and enriched by tracery and carved work. Higher up there is a carved cornice surmounted by an ornamented cresting. The tracery fills the whole space within the arch.

A New Methodist Chapel at Baptist Mills, Bristol, has just been renovated. The whole exterior of the chapel has had a covering of new cement. A new entrance with pilasters and cornice leads into a lobby with tiled floors and pitch-pine screens glazed with cathedral glass in leaded lights. Inner lobbies with swing doors are on each side of the lobby, and from these lead staircases to the galleries; for exit from these there are outer doors at each side. The interior has been re-decorated. New gas pendants and brackets with incandescent burners and a new hot-water apparatus have been provided for the chapel and school premises. The cost of the whole work is about £1,200. The general contract has been carried out by Mr. A. G. Matthews, of Redcliff Hill, and the heating apparatus by Messrs. Skinner & Co., Stokes Croft. The architects are Messrs. La Trobe & Weston, F.R.I.B.A., of Clare Street, Bristol.

Giggleswick School Chapel was dedicated last Friday.

A New Cottage Hospital for Whitby has been erected in Grape Lane at a cost of about £1,100.

A New Wesleyan School for Winton, Blackburn, is being erected to cost about £2,000. The new school will accommodate 700 scholars.

New Stained-Glass Windows have been erected in the baptistery of St. Peter's Church, Abbeydale Road, Sheffield, and have been executed by Messrs. Jones & Willis, of Birmingham.

Mr. William Swift, architect and surveyor, of Truro, died recently at the age of fifty-one years. Mr. Swift had resided in Truro twenty years, and was with Messrs. Henderson at the Mining School before starting to practice for himself eight years ago.

Fletton Parish Church, owing to a large increase in the populotion of Fletton consequent on the extension of the brick industry, has been enlarged by doubling the width of the north aisle of the church. The work was entrusted to Mr. Boyer, architect, Peterborough.

"The Eighteenth-Century Architecture of Bath" is the title of a book by Mowbray A. Green, A.R.I.B.A., which will shortly be published by Mr. George Gregory, of Bath. The book will be illustrated by 100 plates, together with plans, sections and other architectural details. It will be issued in four parts, large quarto, at the price to subscribers of 7s. 6d. per part.

A Hull Church Improvement.—At St. Augustine's Church, Hull, in Prince's Road, a new tower and porch is being erected. The tower will rise to the height of 75ft., will be built from designs by Mr. Temple Moore, London, and will be in harmony with the rest of the edifice. Its estimated cost is £1,200. New Sunday schools are also being erected to cost an additional £1,300.

New Baths and Washhouses at St. Pancras have been erected in the Prince of Wales Road, Kentish Town, upon an area of about 35,000 sq. ft., and comprise four swimming baths and a public washhouse with fifty washing compartments. Two of the swimming baths have each a pond 100ft. long by 33ft. wide. The first-class bath can be arranged as a public entertainment hall for the winter months, for which purpose it is capable of seating 1,200 persons.

Building Collapse at Newport, Mon.—A large block of shop premises at the corner of High Street and Griffin Street, Newport, Mon., collapsed early last week through the failure of an 18in. brick pier which supported heavy iron joists on which the middle portion of the premises rested. The collapse was probably caused by the subsidence of the ground. Messrs. Habershon & Fawckner were the architects of the building, which was completed in 1891 by Mr. Charles Lock, builder, of Newport.

A Naval Monument.—The committee of the Royal Marine Memorial Fund has commissioned Mr. Adrian Jones, the well-known sculptor, to execute a monument to the memory of the men who died heroically in China and in South Africa. The memorial will consist of two soldiers of the Royal Marines, one wounded lying on the ground, the other standing erect and defiant with bayonet fixed. There will be bas-reliefs on either side of the pedestal showing the regimental badge and motto: on the front and back will be the names of the fallen heroes, while at each corner a dolphin will be placed. The figures will be 8ft. high, and it is hoped that a suitable site will be found near the Admiralty.

The Additions to St. Saviour's Church, Ravensthorpe, were consecrated recently. The addition to the church consists of transepts, a north chapel and a large vestry chancel, and the north aisle is to be added with clearstory and arcading to the nave, the cost in all being estimated at £8,500. Upon the additions just consecrated about £6,500 has been expended. Mr. C. H. Fowler, F.S.A., of Durham, prepared the designs, and Mr. Thickett, of Horbury, has carried out the work. The walls are substantially built of stone with faced dressings and buttresses, and the roof is of red tiles. The windows are fitted with cathedral glass. The altar rails are of oak on iron and brass standards. There is no reredos at present, a plain dossal taking its place. Green-stained chairs are used for seating.

An International Exhibition at Edinburgh in 1904 or 1905 is proposed. At a meeting of citizens held last week a committee was appointed to consider the question of site and other preliminary matters.

"The Scientific Roll," a magazine of systematised notes published by Mr. R. L. Shorland, of 38, Churchfield Road, Acton, W. (price 1s.), has just reached its third number, which completes the general bibliography relating to bacteria.

The Alterations at Windsor Castle, made by the King's orders, are so extensive that the old guidebooks will now be useless. In addition to new billiard and smoke rooms, the state apartments are completely changed.

The Ancient Cathedral of St. Brendon, of Clonfert, with its "matchless doorway," its Romanesque east window, and its quaintly-carved chancel arch, has had its discoloured plaster and mouldering woodwork renovated and alterations made to prevent damp.

A Find interesting to antiquarians has been made on the south side of the River Clyde, near Dumbarton. Mr. John Bruce has come upon a crannog or pile dwelling of the Roman period, which is regarded by some leading antiquarians as a notable discovery, equalling in importance the famous Dumbreck crannog find.

The Clergy and Artists Association held a small exhibition in connection with the Church Congress. The artists contributing included Mr. Walter Crane, Mr. G. F. Bodley, Mr. Reginald Hallward, Mr. Louis Davis, Mr. J. J. Guthrie, Mr. W. Goscombe John, Mr. W. B. Reynolds, Mr. A. H. Skipworth, Mr. E. S. Prior, Mr. Aylmer Vallance, Mrs. Hallward, Miss Ruby Levick, Miss Evelyn Underhill and Miss Mary Newill.

The Exhibition of the Welsh Industries Association was reopened at Cardiff last week. A feature was the great improvement in quality of many of the exhibits. This was notably the case in the weaving section, both as regarded colour and texture. Carpet and curtain weaving showed a great advance, and the cloths for men's wear were declared by the expert judges to be softer and of better texture than heretofore. The exhibits in the woodwork section received high praise from Mr. Goscombe John, A.R.A.

The Church of St. George, Chichester, is now in course of erection, and is intended to be the new parish church of Rumboldsdwhyke. It is close to the vicarage, on a portion of the glebe near the junction of Cleveland and Whyke roads. The old parish church does not afford sufficient seating accommodation for the population which has sprung up in the parish. £3,500 is the amount of the contract with Messrs. Dove Brothers, the builders. The new church will be built of brick, with stone dressings for the windows, and will be a simple structure in the style of the thirteenth century.

NEW PUBLIC BATHS AT CHESTER.

NEW public baths were opened at Chester recently. There are two plunge baths. The larger of the two, or second-class bath (to be known as the Atlantic) for males, is 75ft. long and 35ft. wide, with a depth of water varying from 3ft. 6in. at one end to 7ft. at the other, and surrounded by dressing compartments and up above a gallery in which at water polo and swimming matches there will be accommodation for spectators. When it is not in use as a bath the fittings can be removed, and this bath can be adapted to a gymnasium or for any other purpose. The first-class plunge bath (to be called the Pacific) is rather smaller, being 60ft. by 30ft., and will be reserved for ladies on certain days. There are seven second-class slipper baths and one vapour, three men's first-class slipper and one vapour, and four women's slipper baths, with waiting-rooms and separate entrances for the sexes. The water used in the baths will be taken from the city mains and heated to whatever temperature may be required. The baths themselves will be heated throughout with steam. The cost of the baths, which are built in stone and Ruabon bricks, was estimated at £11,000, but this sum has been considerably exceeded. The architects were Messrs. Douglas & Minshull, and the contractor Mr. W. W. Freeman.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Oct. 11	Edinburgh—Cookery Room, Workshop and Gymnasium	School Board	Mr. Carfrae, 3 Queen Street, Edinburgh.
” 11	Upholland, Lancs—Wall	Urban District Council	C. E. Senior, Clerk and Surveyor, Council Offices, Upholland.
” 12	Devizes, Wilts—Visiting-room at Asylum	County Council	C. S. Adye, County Surveyor, County Offices, Trowbridge.
” 12	Cheltenham—Town Hall	Corporation	E. T. Brydges, Town Clerk, Municipal Offices, Cheltenham.
” 12	Farningham—School	School Board	J. H. Tait, Architect, Dartford, Kent.
” 12	Berkhampstead—Additions and Alterations	Guardians	C. H. Rew, Architect, Berkhampstead.
” 12	Whitehead—Villa and Stabling	———	'. Russell, 22. Waring Street, Belfast.
” 12	Beddgelert—Villa	———	O. M. Roberts & Son, Architects and Surveyors, Portmadoc.
” 12	Filey—Two Houses	———	G. Mallinson, Architect, Filey.
” 13	Stelling—House	Mr. Thomas Major	H. Videan, Architect, Eversley, Bournemouth Road, Folkestone.
” 14	Belfast—Slates, Firebricks, &c.	Harbour Commissioners	G. F. L. Giles, Harbour Engineer, Belfast.
” 14	Beckenham—Two Cottages..	Urban District Council	J. A. Angell, Surveyor, Beckenham.
” 14	Taunton—Bedrooms, &c.	Committee of Hospital	J. Houghton Spencer, 5 Hammet Street, Taunton.
” 14	Batley—Extensions	———	C. H. Marriott, Son & Shaw, Architects, Church Street Chambers, Dewsbury.
” 14	Hessett—Enlargement	School Managers	School House, Hessett.
” 14	Bristol—Extension of Shed "M"	Docks Committee	W. W. Squire, Engineer's Office, Cumberland Basin, Bristol.
” 14	Pontefract—Two Houses	Mrs. A. L. Robinson	C. Keyworth, Architect and Surveyor, Bank Chambers, Pontefract.
” 15	London, S.E.—Receiving Ward at Workhouse ..	Lambeth Parish Guardians	Fowler & Hugman, 9 Craig's Court, Charing Cross, S.W.
” 15	Braintree—Cattle Market	Urban District Council	F. Whitmore, Architect, Chelmsford.
” 15	Slough—Gasworks	Gas and Coke Co.	T. Webb, Engineer and Manager, Gas and Coke Co., Slough.
” 15	Sligo—New Chapel	District Lunatic Asylum	Sir Thomas N. Deane & Son, 15 Ely Place, Dublin.
” 15	Llwynypia, Wales—Houses..	Pontrhondda Building Club	W. C. Pritchard, Glamorgan Coal Company's Office, Llwynypia.
” 15	Kendal—Walling	Town Council	R. H. Clucas, Borough Engineer and Surveyor, Kendal.
” 15	Carlisle—Houses	———	Johnstone Brothers, 30 Lowther Street, Carlisle.
” 15	Bristol—Baths	Baths Committee	T. H. Yabbicorn, 63 Queen Square, Bristol.
” 15	Hampstead—Parochial Hall	———	J. B. Lofting, 37 Old Queen Street, Westminster.
” 15	Keighley Rebuilding Station Inn	Midland Railway Company..	Mills & France, 99 Swan Arcade, Bradford.

An Architectural Causerie.

The late Mr. Brooks. THE late Mr. James Brooks, whose death we were able to briefly announce in our last issue, was one of the most hard-working as he was one of the best of our modern church architects. His energy was indefatigable, and his whole philosophy is summed up in the aphorism which will be found at the head of another page. It was work—and good work—that raised him to the high position he occupied. Church architecture in this country to-day, though the Gothic flame is long since quenched, is far more satisfactory than many other branches of the art—shop premises, for example; and while designs of a very distinctive character are seldom seen, the average merit of the churches built is pleasingly high. This is no doubt a legacy of the Revival, but it is also due to the fact that there are several church architects of distinction yet amongst us whose work exerts a leavening influence. Such work is that of the late Mr. Brooks. We cannot look, for example, at his last large church—that of the Holy Innocents at Hammersmith—without feeling the strong character of the man who created the design; and nothing is perhaps more noticeable than the proportion observed between wall-space and abutment, solid and void. It is the excellent proportion which gives character to this architect's work. The same applies to the many other large churches which he built in London: St. Michael's, Shoreditch; St. Mary's, Haggerston; St. Columba's, St. Chad's and St. Saviour's, Hoxton; St. John the Baptist's, Kensington; or the beautiful Church of the Annunciation at Chiselhurst. Mr. Brooks's death leaves a great gap in the ranks of church architects, but we would wish that the examples which he has left us may infuse in others the spirit of thoroughness and attention to detail which resulted in such excellent buildings as those mentioned. It is perhaps not generally known that in those early days when Mr. Brooks practised farming in his native village—Hatford, Berkshire—he invented a threshing machine and a new "breast" for the plough-share, both of which were commercially successful; in fact the latter is practically the "breast" of to-day. It has been wisely said that it is the inventive faculty which differentiates between genius and mediocrity, and the freshness in treatment which characterises all the churches designed by the late Mr. Brooks is in no small measure due to his possession of this faculty. As he himself asked at a meeting of the Institute in 1895, when the Royal Gold Medal was presented to him, without the gift of invention how could a man become an architect? But even if this were his natural gift, it could not be fruitful without systematic training and study, and Mr. Brooks was a zealous supporter of students receiving such a training and not allowed to learn their calling in the "tumble-up-way" which he himself experienced. Another interesting fact concerning Mr. Brooks is afforded by his great dislike for subordinates to do his work. He employed no assistant in his heyday, even when engaged concurrently on six sets of church drawings, an example which should prove very inspiring to some of the laggards found in modern offices. Though Mr. Brooks's fame rested mainly on ecclesiastical designs, these were by no means his only achievements, for he built (among others) a large brewery, an hotel, many secular buildings, two hospitals in connection with Sisterhoods, extensive stables for the Marquis of Londonderry, labourers' cottages and gentlemen's mansions—a range catholic enough. An illustrated biographical article on Mr. Brooks, who was born in 1825, appeared in our issue for April 2nd, 1895. We learn that the style of the firm will remain unchanged—Messrs. James Brooks, Son & Godsell.

THE LATE MR. JAMES BROOKS, F.R.I.B.A.

Some Addresses. OUR space is crowded this week with reports of the opening meetings of architectural societies. Inaugural addresses, unfortunately, often form very dry reading, but those which we print this week certainly do not come under such a head, and we consider the occasion opportune therefore to point out that no good comes out of long discourses which bore to death everyone whose misfortune it is to sit them out. A much more useful purpose would be served if, like Professor Simpson at Liverpool, Mr. Seth-Smith in London, or Mr. Darbyshire at Manchester, presidents confined their remarks to certain specific subjects of topical interest, to which they are thus able to devote profitable attention, rather than to weary their hearers in the manner so eminently characteristic of the æsthetic young curate preaching on the virtues of Saint Paul.

"Squash" Courts. "SQUASH" courts are not places for the preparation of beverages in large quantities, neither are they intended to be used for the systematic compression of human beings; they are enclosed spaces in which the game of "squash" can be played, a game of *long* tennis. Such courts measure 100ft. by 36ft., but despite this fact wealthy New-Yorkers are providing them at their private residences at a minimum cost of £5,000. The "squash" court is rectangular, and has an inner wall 7ft. high running around three of its sides. A sloping roof (the "penthouse") stretches from wall to wall. From one point in the main wall a tambour projects to deflect the ball across the court, and in the inner wall below the penthouse there are several openings. These courts provide a good deal of work for architects, as the buildings which surround them are somewhat extensive; but such buildings are, naturally, not required when the court is formed on the roofs of other structures, as now proposed in New York.

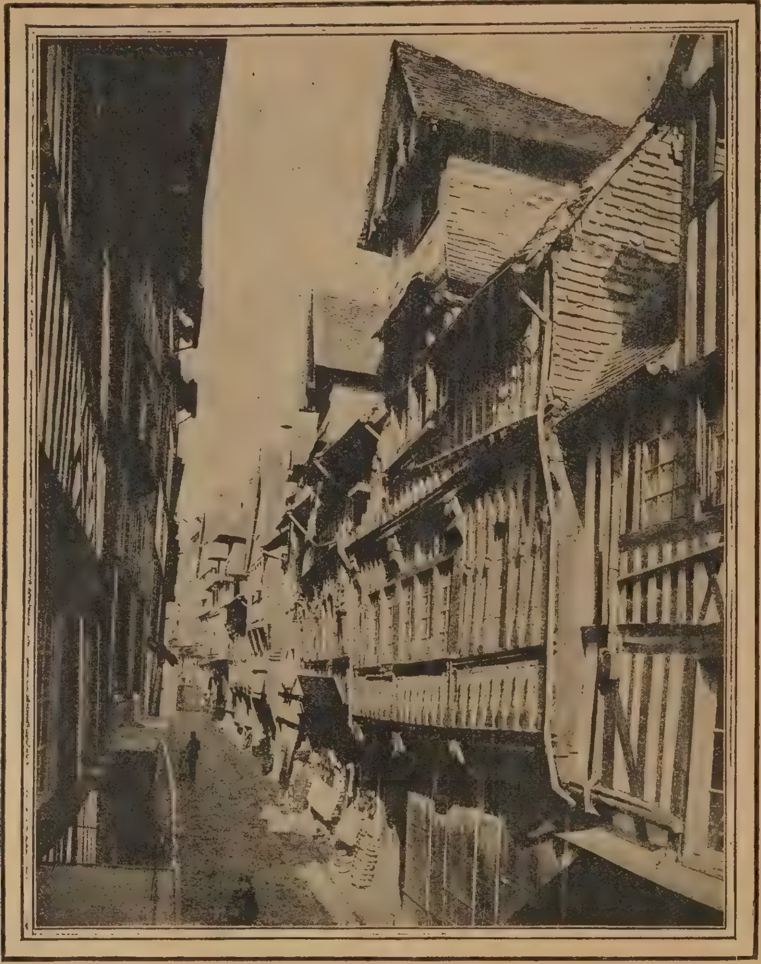

FIG. 9.—SIXTEENTH-CENTURY HOUSES, RUE AUX FEVES, LISIEUX.

WOODEN HOUSES IN FRANCE.—II.

By JEAN SCHOPFER.

(Concluded from p. 123 of No. 347.)

THE succeeding illustrations (Figs. 9, 10 and 11) present a picturesque aspect of the streets of the Middle Ages. The first one shows some old houses in the Rue aux Fèves at Lisieux, in Normandy. They belong to the sixteenth century, but were it not for certain carved details they might just as well be a couple of hundred years older. We see clearly the idea the builder had of corbelling. In wood construction it is done in the simplest manner. The beams of each floor extend from 1ft. 6in. to 3ft. beyond the line of the storey below. On these ends is placed the sablière beam of the next storey. The whole is strengthened by brackets which support the ends of the beams. Corbelling was the rule in the Middle Ages. Generally there are two storeys, the upper one overhanging the ground floor to the extent of several feet. Doubtless this shut off a good deal of air from the lower part of the houses, but it was necessary to make the most of the available space, and in town houses the living rooms were always above, so that it was only the shop, which occupied the ground floor, that suffered from lack of light and air. From a picturesque point of view the old street with its pointed gables, its large dormer windows, its successive corbellings, the door and window carvings, and, above all, the individual appearance of each house, with a style and decoration of its own, evidently presented a picture far more cheerful, varied and artistic than the modern street offers with its lines of utilitarian barracks. In the Middle Ages the house was a thing which a man constructed not only for himself, but to be handed down to his descendants. For this reason it was ornamented and given a stamp of its own, for it was built for a particular family having its own style of life, its own traditions, and desiring a dwelling-place in harmony with its tastes. It will be remarked that there are also at Lisieux some specimens of the *pan de bois* of which we have spoken before. The following houses are at Beauvais and Bayeux. The brackets supporting the corbels afforded an excellent opportunity for carved decoration, and the clever *ymaigiers* of the fifteenth and sixteenth centuries profited thereby, as we shall see in detail. But before coming to the more elaborately ornamented houses let us look at a few simple types of large houses.

At Lisieux there is a house with two gables on the street. The way in which the attics are sheltered is interesting. It has been much imitated latterly for country houses, especially in this country. In this house we see the variety of effect proper to wooden edifices. The employment of crossings of different kinds of wood is in itself a decoration. The Norman roofs are always tall and picturesque.

Here again we must lay stress on that peculiarity of wood construction shown in the Swiss châlets, and which consists in taking advantage of the necessary and organic elements of the construction, and, instead of trying to hide them, endeavouring to turn them to account and make them express a decorative theme. What was true of the châlets is equally true with regard to the French houses of the Middle Ages. The big sablière beams, the brackets, and the external and visible arrangement of the framework are at the same time a decoration, not accidental but intentional; not haphazard but desired and aimed at.

At Rennes (Fig. 12) there is a house of very different aspect. Note the curious manner in which the corbels are executed and the place occupied by the carvings on either side of the door.

In the next house (Fig. 13), which is to be seen at Bourges, we meet with another spirit and other aims. It is called "La Maison de la Reine Blanche." The timberwork is reduced to a minimum; only the main lines are visible, the panels being filled in with brickwork. But what rules supreme here is the carved decoration, and

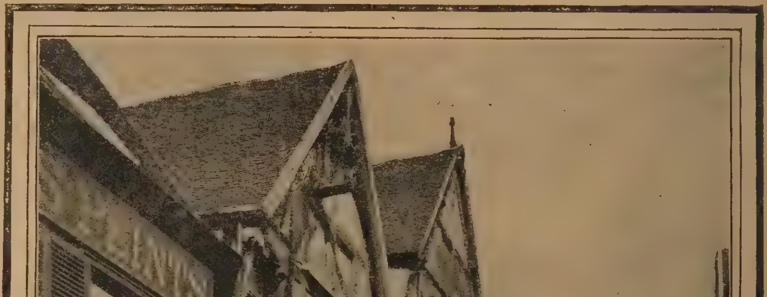

FIG. 11.—RUE DE LA MANUFACTURE, BEAUVAIS.

being the first really complete example we have it is worth while to pause and to look into it.

In Switzerland the châlets receive a very rich carved decoration; but it is pure ornamentation, not statuary. It consists of friezes with series of small arcades, and of diamond moulding, awaking in the mind recollections of Romanic decoration, of which the art of the châlets is but a survival. We have remarked how interesting is this tradition, which is seen flourishing again on the Swiss châlets so many centuries after its disappearance from Europe. In France the wooden houses slipped away from the Romanic tradition. Construction in wood was only recommended, as we have seen, at the end of the thirteenth century, when Gothic art had already reached the plenitude of its means and forms. The art of working in wood seems to have remained a stranger to the expansion of thirteenth-century art, and even during the following century it furnished no contribution to the artistic work of the century. This is a curious thing, and one which cannot be explained; but it must be noted that while we know certainly that wooden houses were built at the end of the thirteenth century and during the whole of the following one, we have not a single example of wooden houses with thirteenth- or fourteenth-century carvings on them. We must come to the fifteenth century to find, in the kind of construction we are dealing with, a current of art similar to that which manifested itself in stone construction. The only houses with carvings are fifteenth- and sixteenth-century edifices; and we must add that statuary then occupied a far more prominent place than ornamentation.

It is seen here without difficulty that one is in a place where the representation of the human face and body is a thing that has been done for a long time past, where the faculty is possessed of expressing in the plastic art the sentiments and passions, and where, too, it was known how to unite carved decoration to the architectural conception.

In the "Maison de la Reine Blanche," for instance, where it is found quite natural to figure on the ground-floor pillars scenes from sacred history, such as Christ in the Garden of Olives; there, a kneeling woman playing a viol and wearing the ample robe with heavy folds of which Burgundian sculpture had at the beginning of the century produced unforgettable models! Above, there are consoles, supporting heads; here, the large face of a monk; there, a woman's face, wearing a hood. On the brackets of the roof there is the same series of grotesque heads, many of the types of which are to be seen on the stalls of cathedral choirs. Thus, this house, although not a palace nor a grand abode, furnishes a contribution to the statuary treasures of its period.

At Luynes (Indre-et-Loire) there is, on the square of the town, a high-roofed house which has some fine carvings on the big beams of its ground floor (Fig. 14). On one of the door posts there is a long-robed Virgin, and on the other a Virgin with the body of Christ on her knees; at the end, on the same side, a Saint Christopher crossing the Waters, and on the other a bearded individual of majestic mien, perhaps a wise man of the East. This splendid series of carvings now ornaments a butcher's store. To us this is not at all displeasing. This art was not a mandarin's art; it was intended to be understood and loved by all, and it is in its right place near the lowly and those who toil. More than one such house could be found in France, although many images taken from Holy Writ were destroyed during the religious wars, during which the Protestants acted with the greatest barbarity whenever they came across scenes dear to Catholic iconography. Besides, a great number of these figures were removed, and very few of them have found their way into the museums.

At Levroux there is a corner house with some curious grotesque figures carved on the capitals (Fig. 15).

The next four houses are interesting in several ways. They carry us towards the sixteenth century. The spirit of the Renaissance shows itself in them, at first in the ornamentation, as is always the case, and afterwards in the construction; and then it is the decay, and speedily the ruin, of the woodworking art.

The house at Abbeville (Fig. 16) named after François Premier is faithful to the old-fashioned style of construction. It marks the end of a Gothic epoch; statuary mingles with the ornamentation, which is still Gothic. Above the door one sees a Virgin holding the Child Jesus.

The presbytery at Treport is a house in which brick and stone combine with wood in the happiest manner possible. Upon a ground floor in masonry there is an overhanging *pan de bois* with heads in medallions ornamenting the beam ends (Fig. 17). The decorative effect obtained by the crossing of the timbers and the filling-in of bricks in two colours is charming.

A large house at Saint-Valery-en-Caux shows us a fine arrangement of timberwork, and gives another example of the old habits of construction. The new spirit is manifested in the large ornamental friezes running in three lines along the front. It is the antique ornamentation—masks and garlands; balusters above the doors. The carvings are much dilapidated, but enough is left to fix the date of the work. (Fig. 18.)

At Rennes we have a very pretty entrance of a house dating from the same period. The crossings, the decoration and the admirable proportion of the parts make it an example of excellent style, and we think it will be examined with interest. (Fig. 19.)

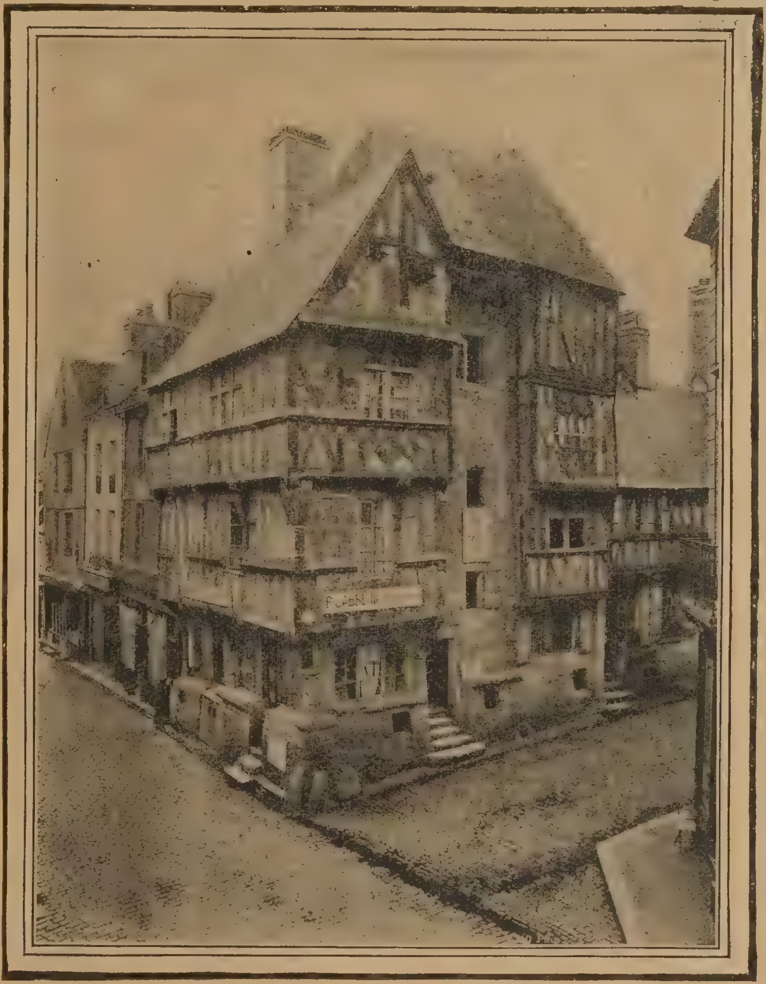

Fig. 10.—House in Palis (Aube).

The house illustrated in Fig. 20 is situated at Roye (Somme), and is also a typical specimen of the class we are now studying. In general appearance it belongs to the Middle Ages. The shape of its roof and its bays of joists, which strive to appear ingeniously combined but are in reality heavy and awkward, might date the end of the fifteenth century; whereas the carvings on its brackets and the decorative spirit of the façade place it in the middle of the sixteenth. Note the heads, the foliage and the brackets covered with all the cast-off clothing of Roman antiquity, which surely has no business on this Middle Age carpentry.

We now reach the completion of the system whose first types we have here pointed out. Standing before the Renaissance house at Rouen shown in Fig. 21, we feel we have changed country. Assuredly, if we wished to consider merely the manual dexterity of the sculptor who has carved this front as one would carve a chest or a coffer, there would be ground for admiration, and we would be ungrudging in our praises. The work is rich and of remarkable finish. Every part is covered with the most elaborate ornamentation. On the brackets are little genii, who come from afar and speak a foreign tongue; the wide plain borders, the false galleries on the several storeys (for the pilasters certainly suggest a gallery), the masks on the brackets, and, lastly, the medallions on the upper storey—everything combines to denote a common origin, not French, but antique. It is an adaptation, not an original. But what is more important is that it is not an adaptation of a style of working in wood, but a transposition from one material into another. This system of decoration belongs properly to the art of working in stone; it is in stone that it was created and developed, and one cannot understand it otherwise. In wood it is void of signification. The deep-rooted reasons for the art values of the Swiss châlets are that the construction is real, not transposed; that it is based on the qualities of the substance; and that it has logically followed the rules of construction imposed by the choice of this material. French house-construction of the Middle Ages, with other needs to satisfy and other kinds of timber at its command (oak, not fir), has obeyed the same logical principles. It was timberwork, and timberwork it has remained, and it has managed to extract from its theme of construction charming decorative effects fully in harmony with this theme. Wooden house-building, as understood at that period, had a long and not unlovely existence. But the Renaissance came. The Renaissance has often been described as a setting free of minds, but it would seem that those who so judged it did not know the Middle

Ages and could not trace the results of Humanism. There was more liberty for art in what are called the Dark Ages than in the French seventeenth century. We know people who prefer Rheims, Paris or Amiens to Versailles or the Jesuit churches. These truths, suspected fifty years ago by a few, are now making their way in the world. One is able to hold these ideas without calling down the scorn of those who talk of art.

In the domain we are dealing with "Antiquity established and demonstrated," as the erudite seventeenth-century humorist said, had the effect of ruining the beautiful and savory forms in which still breathed the life of the nation's past. It subjected Europe to the uniformity of its rule. No more personal interpretation, no more racial sentiment. The antique canons were law.

The French sixteenth century defended itself well. It was robust enough to swallow the foreign food and assimilate it to its temperament The admirable series of castles of the Loire are thoroughly French, notwithstanding the ornamentation and the evident plagiarisms. But it is the end, and that for a long time to come.

Wooden-house construction was also condemned. Antiquity declared that the only art worthy of the name was that of stone, and stone began its reign of absolutism. Wood when by chance it was employed endeavoured, in order to exalt itself, to imitate stone, as, for instance, in that house at Rouen which we have before us. Such complete forgetfulness of its origin and *raison d'être* proclaims the end of the art, for it is evident that stone is far superior to timber for this kind of construction and this system of decoration. Wood is not strong enough to struggle here, not being on its own ground. It has nothing to do but disappear. The Rouen house may create an illusion by its carved chest appearance. But look at a *pan de bois* of the seventeenth century—that, for instance, of the house, shown in Fig. 22, situated at Bar-sur-Seine, in the Aube. There the absurdity is glaring. These fluted pilasters, those composite capitals, those heavy brackets, the ovolos and the palm leaves, the window supports, and, mingled with the whole, a *pan de bois* regularly and wisely arranged—all this makes up an architectural monstrosity, and we feel that we ought to apologise for putting it before our readers.

The *pan de bois* as understood in the Middle Ages is of no use now for urban constructions. It has, however, a fairly wide field in rustic architecture. Combined with brickwork it is still employed with success, and we believe that architects can find in the types here submitted more than one interesting motive, more than one ingenious arrangement which deserves to be revived. As has been seen, the effect of a fine *pan de bois* is picturesque, and owing to the variety of combinations it allows it is capable of rendering good service in the hands of a skilful architect. In any case, the ever-powerful charm of these old houses and the knowledge of their approaching end are in themselves adequate reasons to justify this backward glance into the past.

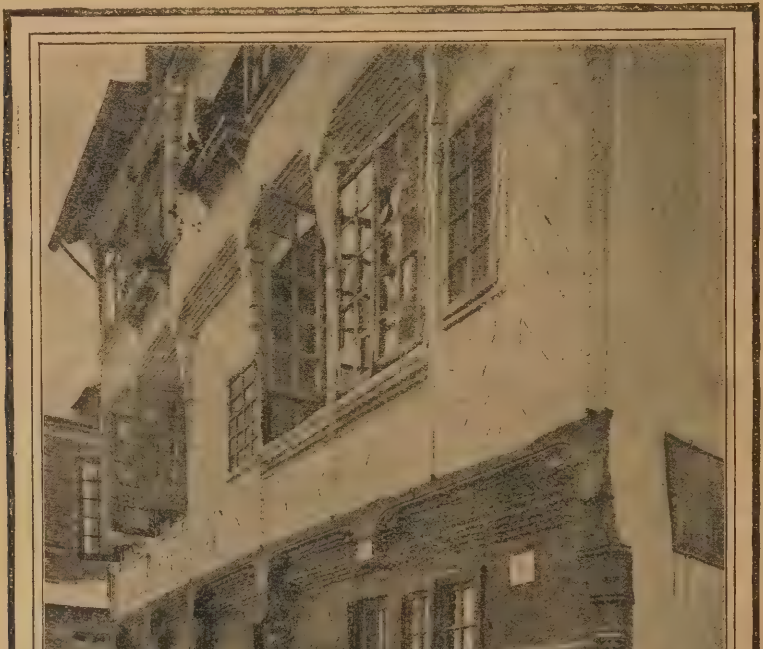

FIG. 12.—WOODEN HOUSE AT RENNES.

LIVERPOOL ARCHITECTURAL SOCIETY.

PRESIDENTIAL ADDRESS BY PROFESSOR F. M. SIMPSON.*

> "*And the Committee decided that the style of the new cathedral should be Gothic.*"

LAST year I read you a somewhat fanciful account of the progress of architecture during the last century, and referred to the see-saw of styles which then prevailed. To-night I take as my text the sentence from a newspaper cutting which I have just read. But before commencing my homily I wish to draw attention to the fact that this is the first meeting which has been held since the incorporation of the Society. I wish to congratulate the members on this achievement, and to express the hope, in which I am sure you will all join, that the incorporation may prove of lasting benefit and give additional strength to the Society. We have not been hasty in taking this step; we are not a young society; we have already celebrated our jubilee; and other societies, more recently formed, have been incorporated before us. If there has been delay on our part, that reproach is now removed; and under our new title we may, I trust, hope for many years of prosperity and many sessions in the future even more successful than those we have had in the past.

The history of the Gothic revival in England is an extremely interesting one, and one that it is now possible to write as it has long since past its zenith. One can therefore review its aims and ideals, and judge with some degree of certainty to what extent it succeeded and in what respects it failed. It stands out as the most remarkable feature in the architectural work of the last century. Last year I dealt with some of the causes which led to it, but a little repetition may perhaps be excused.

Starting more than one hundred years ago, the movement was at first a romantic one and coincided with a similar movement in literature. Later on it became an ecclesiastical movement; later still, an architectural. The chief forces behind it were the growing admiration for the masterpieces of mediæval art, a strong feeling of indignation at their neglected state, and a keen desire to remove this reproach and place the buildings once more in a suitable condition for ritual worship.

The desire for restoration was, therefore, the most powerful factor in causing the revival. Architects were obliged to carefully study these fine old monuments in order to obtain the knowledge required to properly carry out the necessary renovations. This study bred a great love of the style in many, and men became saturated with Gothic detail and learned in its intricacies. The knowledge they acquired for the restoration of old buildings they soon devoted to the building of new. Gothic became the ecclesiastical style. The churches immediately previous to the revival possessed no architectural distinction; and a renaissance of the style which had governed all church-work since the Reformation was rendered impossible by the fact that those who still preferred the Classic style to the Gothic had unfortunately fallen under the sway of Greek art, and could see no beauty in any form of building except a Greek temple. The Gothic fervour spread throughout England; the Continent, it must be remembered, was then hardly affected by it, and to this day the movement has never had a tithe of the force there that it formerly possessed here.

From the first the Gothic revivalists were confronted by the enormous differences which existed between the conditions under which they had to work and those which prevailed in the days when the originals they desired to follow were erected. All through the Middle Ages—in fact, in all times until the end of the last century, except during the short period when the momentous change between the Gothic and the Renaissance was effected—only one style was recognised by the workers of the day: the style in which all worked and from which no man dreamt of departing. Advance they desired and accomplished, but advance was always on the lines they knew and understood. All men were in sympathy one with another; not only the workers, but the patrons and employers also. No committee would have thought then of asking for a Greek or a Roman design, and they certainly would not have got it if they had asked. I do not propose to enter into the vexed question as to the standing of the architect in the Middle Ages. Personally, I do not hold the extreme view that he had no existence; but there is no doubt that the chief-designer, whoever he was—architect, bishop, monk or lay master-builder—occupied a somewhat different position from that of the architect to-day. The Gothic was the democratic style; whether democratic entirely or in part only is immaterial. The workmen had a much greater say in the development of a design than has been possible since. Mouldings and carvings were left in a great measure, if not entirely, to the men who worked them. Masons travelled about the country, their tools in their hands, their templates in their pockets, ready to repeat the mouldings or carvings they had already executed elsewhere

---

* Delivered on October 7th.

Absolute sympathy existed between all workers. To this is owing the rapid development of the style and the perfection it achieved. The Gothic style was not the creation of one man, or even of a few—no one occupies for Gothic the position Brunelleschi occupies for the Renaissance—it was the result of thousands working together harmoniously towards one end and in one spirit.

The revivalists of the last century found themselves attempting to work under very different conditions. They had by careful study mastered the secrets of the style—could tell, within a few years, the date of any moulding or piece of carving; could draw with certainty a section which would not depart one hair's breadth from an ancient example; and were eloquent over the differences which existed between thirteenth- and fourteenth-century carving. But although they were such perfect scholars, they possessed no skill in any of the crafts; they were not masons, neither were they sculptors. This would not have mattered one bit if the masons and sculptors had been equally learned. But at first such was not the case. The sculptors of the day were ignorant of architecture, and thought architectural sculpture beneath their notice; and the ordinary carvers and masons were incapable, if left to themselves, of producing anything which by any stretch of imagination could be called Gothic. These men had to be trained. The great difficulty that Barry, Pugin, and, later, Scott and others experienced was obtaining men who could carry out their ideas. Gradually they succeeded; collections of casts were formed, of which the more important are still to be seen in the Architectural Museum, Westminster, and bands of workmen were brought together capable of infusing mediæval feeling into their work. Something very nearly approaching the conditions of the Middle Ages was beginning to result when the movement began to subside. The demand slackened off, partly because all the cathedrals had been restored, partly because church building activity was not so pronounced as formerly, and partly because of the great increase in non-ecclesiastical buildings, for which the Gothic style was thoroughly unsuited, and which consequently had caused the rise of another phase of architecture altogether. The workmen collected with so much care have died, been scattered, or have transferred their attention to other styles. Of course some remain; so important a movement does not collapse all of a sudden: but in the large workshops there is no longer the enthusiasm for Gothic work which prevailed twenty years ago, and which made the Gothic revival more real than many have supposed. Of the men whose genius carried the revival to its height few survive. Scott, Street, Butterfield, Pearson, Burges, Gilbert Scott the younger, and Sedding, are dead. A few still remain, names we honour and respect; and to these may be added some of the younger men who have remained true to their masters' traditions; but without the slightest exaggeration it may be said that the greater number of architects now practising in England are seeking development in other directions.

It may be thought that I have treated too much of detail, but in the early days of the revival at least it was paramount. The committee say that "the style shall be Gothic." What is Gothic? Unfortunately mediæval detail is still regarded by some, especially by those interested in but not practising architecture, as constituting the Gothic style. But this is the wrong way of looking at it. As I said in an article I wrote the other day, construction, not detail, makes a style. If the Committee are willing to depart from the recognized forms of ornamentation which hitherto have been more or less obligatory, and allow the architect who designs and the other artists who assist a free hand in plan, ordinance and detail, then it is possible that a building can be produced suitable to modern requirements and yet Gothic in the true sense of the word. But if, on the other hand, by Gothic the conventional is meant, if the term is to be narrowed to mean a reminiscence of mediæval buildings—perhaps of only English mediæval buildings—if the plan, mouldings, carvings and accessories are such as will conform to the standard of the amateur, whether ecclesiastial or lay, who takes no interest in living architecture, but who finds satisfaction in examining the work of the past, then there is every danger that the finest opportunity which has occurred since the time of Sir Christopher Wren is going to be thrown away. If the term Gothic is used in its narrow sense, limitations will be placed on architects which workers in no other art would tolerate for a minute; why we should always be the sufferers I fail to understand. We are daily told that other arts are advancing in England and that ours is standing still. I do not believe this for a minute; I believe that the advance in architecture is as great as, if not greater than, that in any other art, but restrictions such as that proposed to be inflicted render advance doubly difficult.

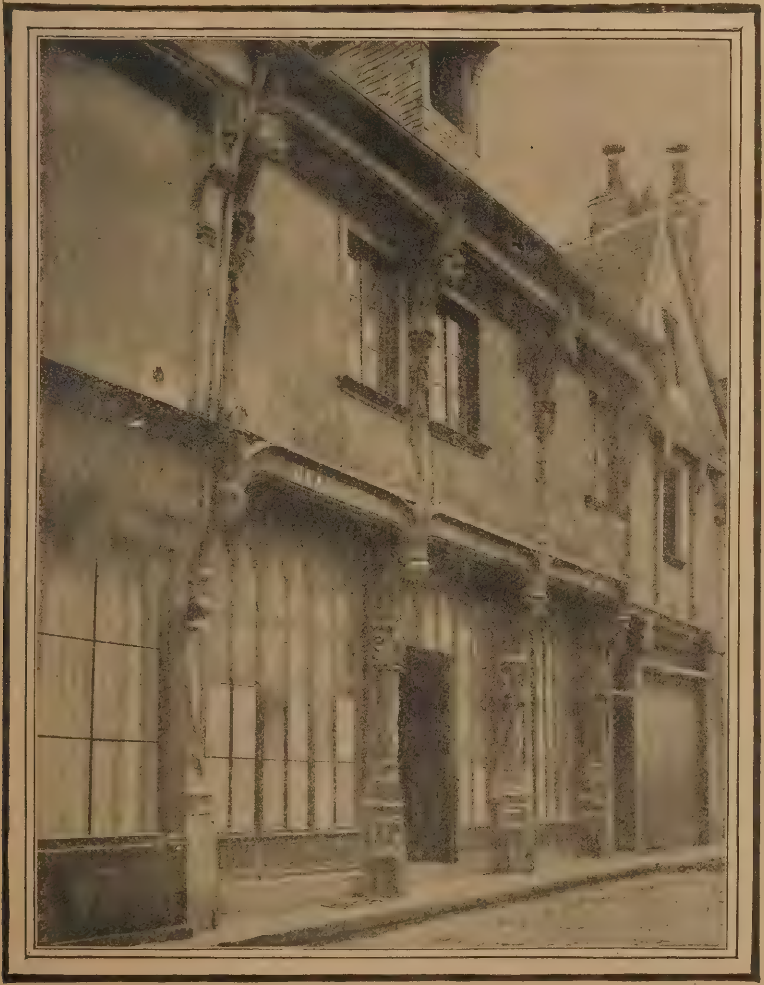

FIG. 13.—MAISON DE LA REINE BLANCHE, BOURGES.

Are painters asked to produce work in the style of Cimabue and Giotto? Are sculptors required to follow the manner of the unknown carvers of the Middle Ages, or the great men of the Renaissance? Are musicians obliged to compose in the style of Handel or Mendelssohn, novelists to write like Fielding or Smollett, or essayists like Addison or Goldsmith? Command a poet to talk in the phraseology of Spenser's Faërie Queene—and hear his language! It is possible we have no artists in any branches whose work can compare with that of Michelangelo, Mendelssohn, Fielding or Addison; but although the work of the modern men may be inferior to that of these giants, it appeals to us more than even the greatest masterpieces because it is the art of the day, because it is the result of individual thought, and because it is only by an infusion of new feeling and new ideas that advance in any art is possible.

The men working now may be, comparatively speaking, failures; if so they fail so that others shall eventually succeed. They are slowly building up a series of monuments which will one day be capped by masterpieces. This is ever the way that art has advanced. The beauty of the Parthenon is not due to Ictinus and Pheidias alone, but to the unremembered men who worked before them. Gothic architecture did not leap to perfection at once; Robert de Coucy, the architect of Reims, and Robert de Luzarches, the architect of Amiens, built those cathedrals on the foundations laid, metaphorically speaking, by their less successful predecessors. If Anthemius of Thralles had been commanded by the Emperior Justician to make the new Santa Sophia in the Greek or in the Roman style the world would have been the poorer by one of its finest buildings. The Emperor had too much good sense; he allowed the architect fairplay and a free hand.

That is all we ask for at the beginning of this new century. If there is ever to be a new departure, now is surely the time. Architecture, more than any other art in existence, suffers from a glorious past. What should be a source of strength to us is converted into a source of weakness.

Nobody admires the old Gothic buildings more than I do. There is not a cathedral in England I have not visited, and most of the best on the Continent I have seen, but that does not make me regard their style as the most suitable one for a modern cathedral.

My objection is not so much to the decision that "the style is to be Gothic" as to the dictation that the style is to be anything at all. The citizens of Liverpool acted otherwise seventy years ago. If Elmes had been told he had to design in the Gothic style we should not have had in St. George's Hall one of the most remarkable modern buildings in the world. I shall be told that that building is different; that it is not ecclesiastical. No more are the Houses of Parliament, built at exactly the same time, and yet that did not prevent the Committee from issuing instructions to architects that the style of the building was to be Elizabethan or Gothic. Have we advanced nothing in seventy years? Is the method observed in London in the first year of Victoria's reign to form a precedent for that to be followed in Liverpool in the first year of Edward VII.'s? There was some excuse then. The tide of the Gothic revival was flowing strongly and men were full of enthusiasm for a new movement. The tide has turned now, the old enthusiasm is dead, and a new movement on totally different lines has taken its place. It is

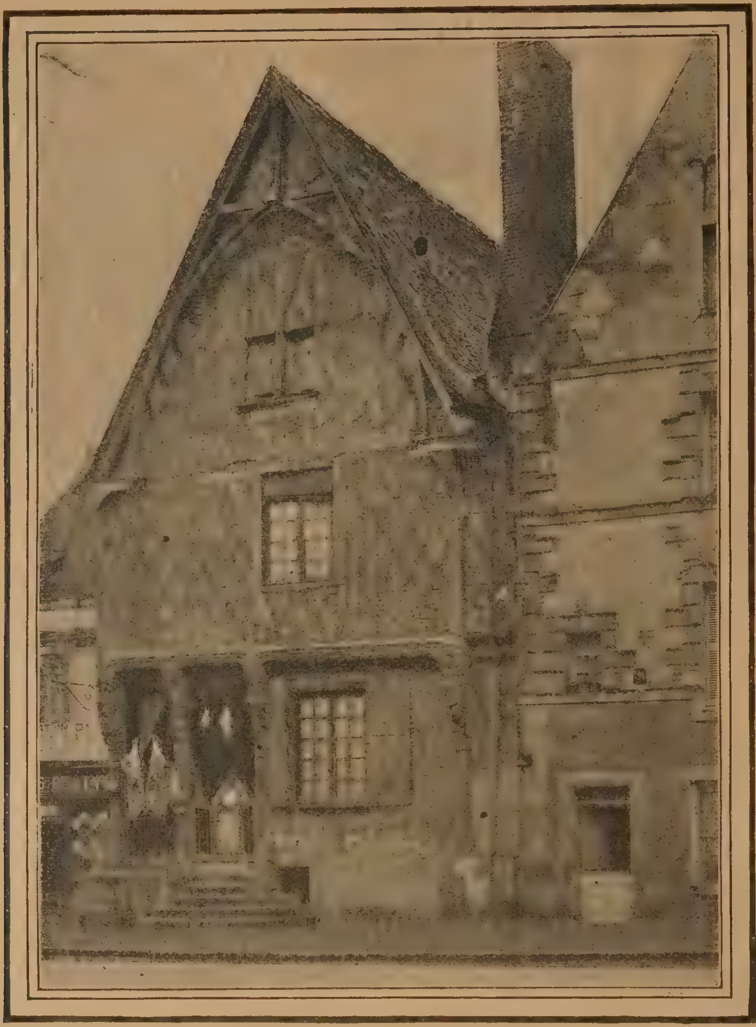

FIG. 14.—WOODEN HOUSE AT LUYNES.

unfair to ignore this fact. Cathedrals are not built every day, another such opportunity may not occur through the century, and the narrowing of the instructions to architects will cut out many men accustomed to deal with big architectural problems whose sympathy with Gothic is but slight, because they regard the style as inappropriate to the requirements of the day and incapable of further development beyond the point reached 400 years ago.

To turn to another point. Against the style dictated there are certain local objections. Liverpool has fine architectural traditions, but they are not Gothic. Its public buildings and many of the fine blocks of city offices erected before the middle of the last century are all Classic. So are the best recent buildings in the town. A Byzantine or Romanesque cathedral would harmonize with those surroundings because both styles are founded on Classic work. Then there is the site; that undoubtedly lends itself more to the squarer Classic or Byzantine than to the longer thinner Gothic. But this I do not wish to dwell upon; I am not protesting so much against the inclusion of Gothic, although personally I regard it as unsuitable, as the exclusion of the other styles. My protest is directed against the interference with the liberty of the designer to express himself in the manner he regards as most suitable. Who can say what the style of a new cathedral ought to be, considering that in no large town in England—except London with its Classic St. Paul's—has one been commenced for over 500 years. Conditions have changed so much since then that the problem for the architect to solve is practically a new one. That the style should be left open was one of the points we emphasised in the meeting which took place between the Cathedral Committee and a deputation from the Council of this Society. The particulars of this meeting may be unknown to some of the members present, and a brief account of it may therefore be of some interest.

The invitation to send a deputation came as a surprise, but was none the less appreciated. I do not suppose that any of us considered it likely that our suggestions would be accepted in full; but it was a considerable disappointment to learn from the daily papers that every suggestion we made had been overruled, and that on every point the decision of the Committee was the direct opposite of that we advised. When our suggestions are known I feel certain that the regret felt by the Council will be shared not only by the members of the Society but by the profession generally, with very few exceptions.

The points we were invited to express our opinion upon were (1) choice of architect by selection, limited competition or open competition; (2) style to be adopted; (3) how to deal with the site. On the last we expressed no opinion at all, and I was therefore somewhat surprised to see in the local papers that we had met the Cathedral Committee for this purpose only. This account of the meeting was calculated to convey a false impression, as suggesting that the deputation—or rather the Council—had changed their mind regarding the suitability of the site chosen; a matter upon which the Society had already very early and almost unanimously expressed an opinion.

To the first question, the choice of an architect, we replied that we did not believe in limited competition, and said that in our opinion two courses were open to the Committee: (1) to appoint without competition a well-known architect, (2) to have an unlimited competition on certain lines which we briefly indicated. Our principal reason for disapproving of a limited competition was that, outside the very few really well-known church architects, it could not be said that there were many who possessed special claims to be regarded as experts in cathedral planning and design. Many men have recently built excellent churches; but because a man can design a good yacht, it does not follow that he can design an ironclad, and a man who can build a decent church may not be capable of dealing with the much bigger problem of a cathedral. If the Committee did not wish to appoint direct a well-known man as architect, we suggested a competition open to all English architects, the competition to be in two parts. The first was to be preliminary; drawings were to be to a scale of $\frac{1}{16}$in. to a foot, no perspectives were to be allowed, no fittings shown, and no more drawings submitted than were absolutely necessary to explain the design. From the first competition we suggested that not fewer than six nor more than ten designs were to be selected for the final, and that the authors of these should be paid £300 apiece on submitting final designs properly worked out. Our hope was that if these conditions were adopted, and proper assessors appointed, nearly all the best known men would enter, as the labour and expense of preparing the drawings for the first competition would be slight. We further suggested that at least six months be allowed for the preliminary competition, and twelve months for the final. The assessors—we mentioned three—were to be appointed before the competition was advertised to draw up the instructions to architects, to

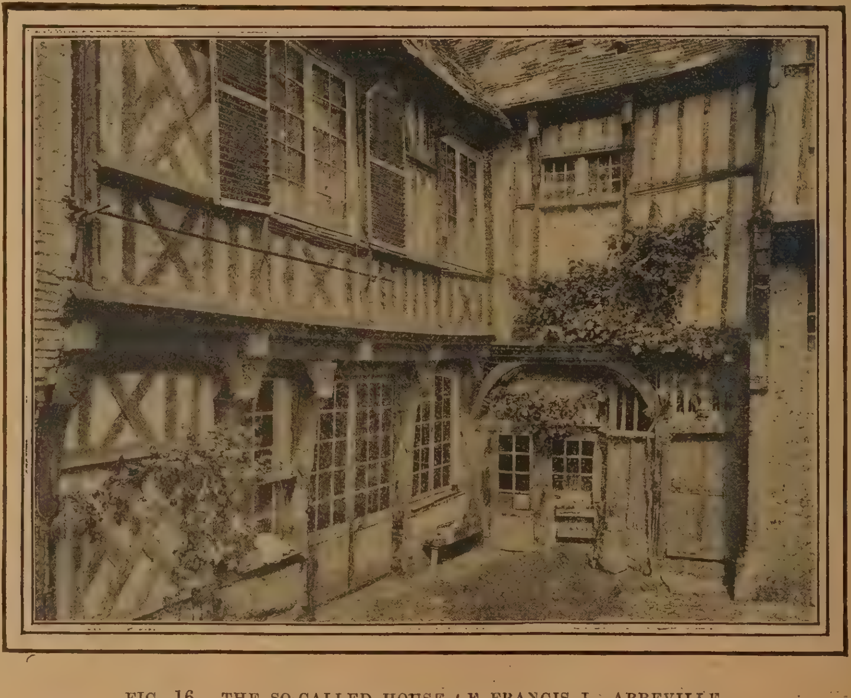

FIG. 16.—THE SO-CALLED HOUSE OF FRANCIS I., ABBEVILLE.

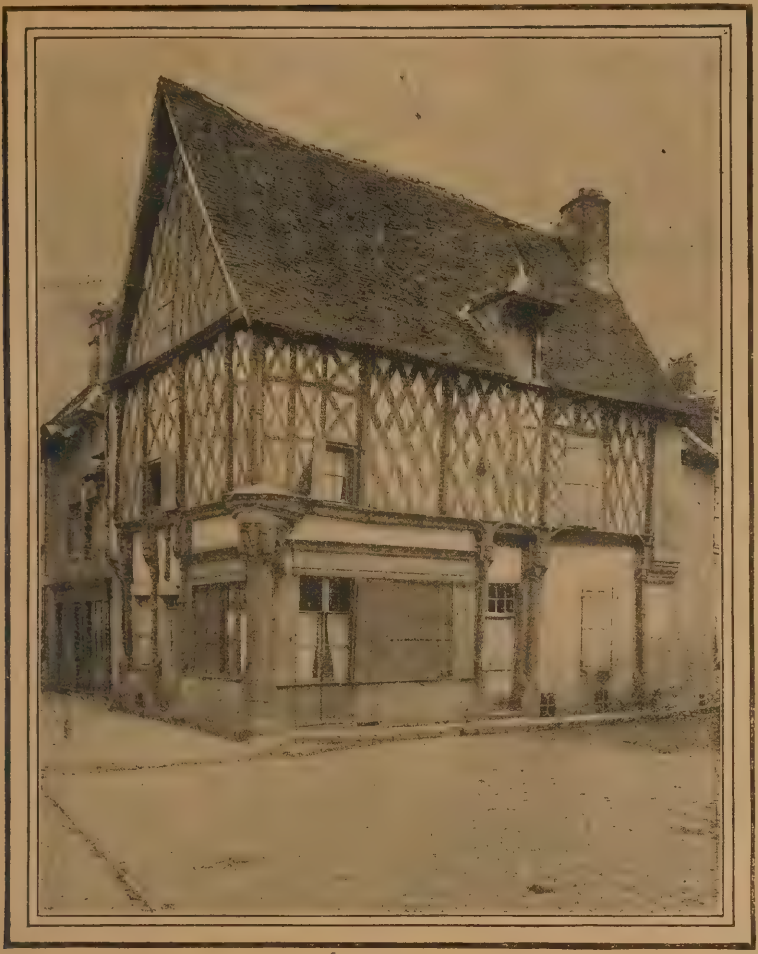

FIG. 15.—WOODEN HOUSE AT LEVROUX.

select the designs for the final competition, and to advise the Committee on the final decision. None of these suggestions have found favour; in fact, I understand that the Committee have decided to dispense with assessors altogether and make their own selections from portfolios of drawings submitted. If this is true, it is opposed to the method under which all important competitions are now decided. It is difficult enough for architects to say from drawings how work will look; still more difficult for men, however able, who have not received a professional training.

The third point was the style to be adopted. After what I have said you will not be surprised to hear that we recommended that no instructions should be issued regarding this. All architects will, I feel certain, approve this recommendation. A cathedral after all has a practical purpose to serve. In architecture the complaint too often is that practical considerations are too much insisted upon, and that architects are not allowed a fair chance of doing justice to themselves. But this is a case of the opposite. Practical considerations are ignored by this restriction; the only result of which will be to fetter the architect; and not only the architect, but all those whom he calls in to assist him.

This is to be the first cathedral of the new century. Is it to be merely the coping-stone of the style of the last century, or is it to be the foundation of the style of the new? Here is a chance for an epoch-making building; for a second Santa Sophia, a second Amiens Cathedral. Is this chance going to be thrown away? The Committee, I am sure, are animated by the same desire as all of us to see a building built worthy of the town and worthy of the opportunity. But, with all deference be it said, they are going the wrong way to obtain it. It is no offence to them to say that not being architects they are out of touch with the architectural movement of the day. They are clinging to a departing style. In an unrestricted competition it is possible that the best design sent in might be Gothic; if so, build it. But the decision of the Committee prevents any attempt being made to show what is possible on other lines. A man who builds a private house for himself in which to live has the right to dictate the style he wishes. But is it not rather different in the case of a cathedral? That is built more for future generations than for the present. The cathedral may take a quarter of a century to build; at the end of that time, if a dry-as-dust design is chosen, and the present architectural movement continues to grow as rapidly as it has done in the last ten or twenty years, it is probable that the first cathedral of the twentieth century when finished will be as obsolete in style as an old East Indiaman is now.

[P.S.—Since the foregoing was written the instructions to architects have been published and confirm the unsatisfactory feeling produced by the preliminary announcement. Is it still too late to do anything regarding the two most important points, the question of style and the appointment of assessors?]

THE LIVERPOOL CATHEDRAL COMMITTEE'S MEETING.

WHY GOTHIC WAS ADOPTED.

A MEETING of the Liverpool Cathedral Executive Committee was held last week at the Church House, Lord Street, Sir William Forwood presiding.

Mr. Robert Gladstone said he desired to make some reply to the remarks made with reference to the rapidity with which they had come to a very important decision—that of the style of architecture to be adopted. He might say that when that decision was arrived at they had a very full committee, including the Lord Bishop and Lord Derby—very important members of the Committee; the subject was very fully and seriously considered, and the decision was unanimously in favour of Gothic. There was no question raised as to the possibility of any other style being adopted. He thought they had come to a very sound decision, because, however appropriate other kinds of architecture might be for public buildings such as town halls or places like the Philharmonic Hall, theatres, &c., he thought there could be no question whatever in the minds of thinking people that Gothic architecture produced a more devotional effect upon the mind than any other which human skill had yet invented. He had sometimes been asked why they had not got a twentieth-century style, or at least why they should not strive for one; and why our architects could not invent something more in accord with present views of public worship and present ideas of religious architecture. He could only reply that there appeared to be no such thing in existence, for with the exception perhaps of the Crystal Palace, an erection of glass and iron, every public building without exception in this country was a reproduction in some form or other of former styles. Sir Gilbert Scott had said with reference to the most beautiful interior of Gothic architecture in this country—that of Westminster

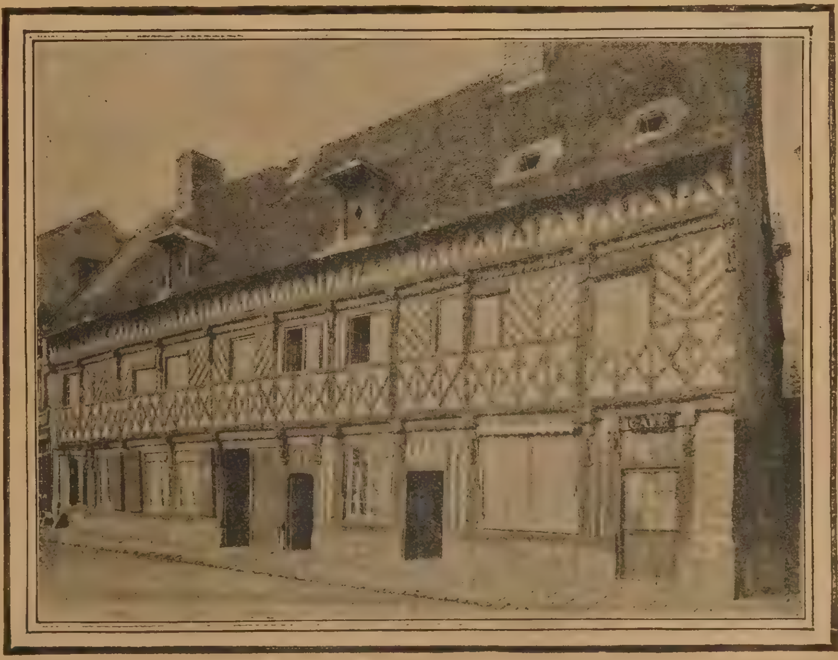

FIG. 18.—HOUSES AT SAINT-VALERY-EN-CAUX

Abbey—when addressing the Royal Institute of British Architects: "It is a building which does not owe its claims upon our study to its antiquarian and historical associations, intensely interesting though these must be to every man worthy of the name of an Englishman. It has claims upon us architects, I will not say of a higher but of another character, on the ground of its intrinsic and superlative merits as a work of art of the highest and noblest order, for there are few churches in this or any other county having the same exquisite charms of proportion and artistic beauty which this church possesses; a beauty which never tires, and which impresses itself afresh upon the eye and the mind, however frequently you view it, and however glorious the edifices which during the intervals you may have seen." He thought that all who had seen it must agree with what Sir Gilbert Scott had said. The great period of Gothic architecture was the hundred years which elapsed between 1220 and 1320, when the early English entered upon the Decorated period. After that Gothic architecture became too much taken up with detail. In Westminster Abbey and other great churches built in that period they found a majestic simplicity in the architecture which conduced, as he thought, most highly to devotional feelings and to the proper conduct of public worship. Therefore he hoped the Committee would adhere to their decision. On the subject of the selection of an architect there had been an unintentional mistake made, which rather led people to believe that it was to be a limited competition. The Building Committee recommended that it should be an unlimited competition. It stood to reason that there were many competent architects in this country who had had little or no opportunity of doing ecclesiastical work at all, still less on the scale of a cathedral, and they thought it desirable to let those who had not yet built churches or even designed them have an opportunity of showing what they could do.

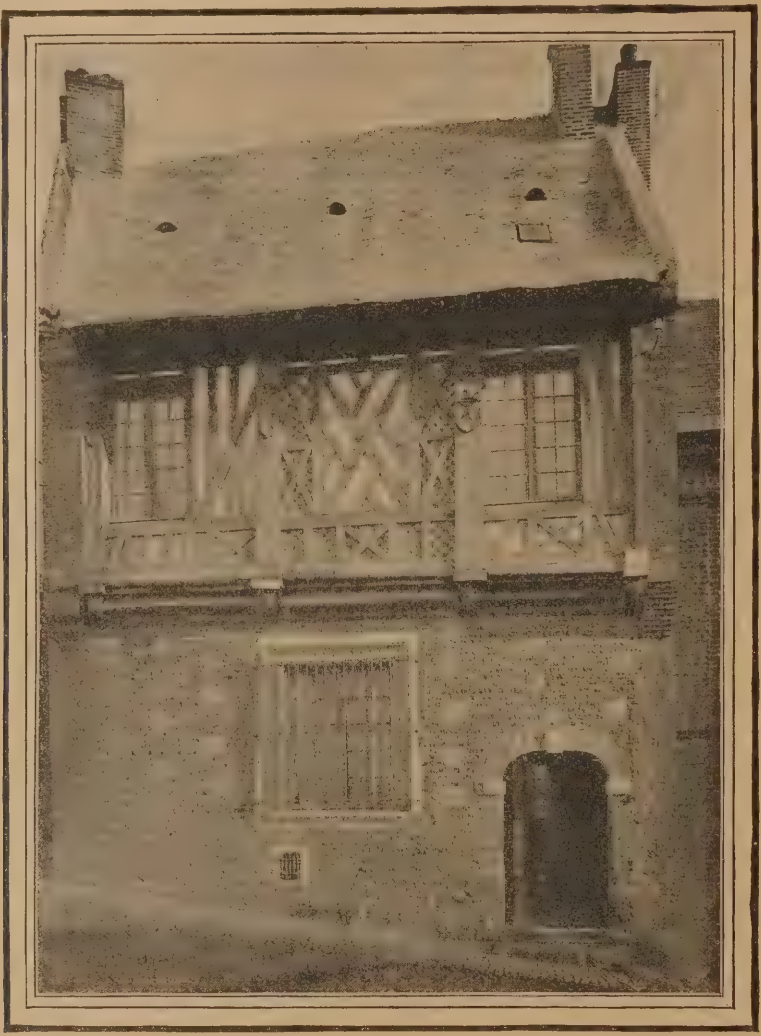

FIG. 17.—THE PRESBYTERY AT TREPORT.

The Committee, having discussed the invitation to be issued to architects, finally decided that they should ask for an unlimited competition in the first instance, drawings of work already done, or designs, to be sent in by December 31st, the Committee reserving to themselves discretion as to employing a professional assessor in making the selection of candidates for the final competition, and also the right to invite architects who should not take part in the first competition to send in designs for the final one.

The minutes were then unanimously confirmed, and the meeting concluded.

Mr. T. G. Jackson's Views.

In a letter to the "Times" Mr. T. G. Jackson, R.A., says:—The Committee with whom rests the choice of an architect for the proposed cathedral at Liverpool are, I believe, about to invite architects who aspire to that great work to submit portfolios of drawings or representations of buildings they have done; and from the field of candidates so formed a certain number are to be chosen to make designs in competition.

May I point out reasons why this plan, which at first sight seems to promise well, is not one from which a successful result may be considered certain, and to suggest a better in its place?

There is, of course, nothing new in the idea of choosing your architect from drawings of what he has done. But this may be and often is a quite fallacious test of his ability. The drawings from which the choice is made are not working drawings. They would be unintelligible to any but an architect—certainly to a committee. They are perspective views which may give a very different aspect to the building from the real one. A draughtsman can represent it from a point of view which is not in reality accessible; or he can surround it with circumstances that exist only in his own imagination. He can exaggerate or diminish its scale, and he can bring his favourite points into unnatural prominence, and repress what he is conscious are weaknesses in his design. It is true photographs of existing buildings do not deceive in the same way; but, on the contrary, they generally make a building look its worst, and far from flattering the design seldom do it justice.

It is high time that a protest should be made against judging architects by their drawings. An architect is not a draughtsman but a creator. It is only by his works that he can fairly be tested, and not by the drawings of them. If the Liverpool Committee are really anxious to get the best man for their new cathedral, is it too much to ask that they should go and look at such modern work as has been approved by competent judges or by general consent, and in that way arrive at a choice of competitors? It would no doubt give them some trouble, but the occasion is one that is worth any amount of trouble; and if the labour is not to fall on the shoulders of the Committee of Selection, on whom should it fall?

If it be said that this would exclude young men of ability who have not many executed works to show, I may point out that the Committee's own scheme does just the same; for men who cannot point to many works actually executed certainly will be unable to submit drawings of them.

A Criticism by Mr. T. Myddelton Shallcross.

Mr. T. Myddelton Shallcross also writes to the "Times" on the subject. He points out that the site selected—that of St. James's Mount—has been unanimously condemned, on its merits, as an unworthy and unsatisfactory one by the Liverpool Architectural Society, and has also been disapproved of by the leading architectural journals, and by a host of individuals. "Even its cheapness is, however, more apparent than real; for, as this feature is due to the fact of the site being an open space and a public recreation ground, the probable future demand for the creation of a public space to replace it will likely cost in the end a greater sum than the estimated difference between the cost of the two sites under consideration, even assuming that the estimated difference were confirmed by the actual result of purchase, which is doubted. . . Better by far that this generation should have contributed the site only, but as perfect a one as their means permitted, than both the site and the building of an inferior character. . . .

"It is not conceivable that in any business of commerce such a condition would be propounded as has been for the building of the cathedral—that the art, science, thoughts and lives of those of the present age should be ignored, and that a lifeless copy of the works of those who lived in a previous age, say in the thirteenth or fourteenth centuries, and the conditions of whose lives were so totally different from those of one's own time, should be required from the designer of the Liverpool Cathedral. . . .

"Regarding any work not architectural, there would never be any question but that all the experience of the past and the accumulated knowledge and art of the present would be brought to bear upon it; and the instructions which the promoters of such an object would give to their advisers would be admittedly ludicrous if trammelled by the conditions which the promoters of the Liverpool Cathedral have laid down for architects. Such conditions must inevitably ensure the atrophy of all an architect's originating brain-power and the substitution of the deadly spirit of plagiarism. . . .

"As to the competition, an architectural competition for any building, excepting under well-defined conditions and subject to the appointment of a professional assessor of repute, seldom, if ever, ensures the best design being obtained; and even under those favouring circumstances the result is frequently disappointing and unexpected. The form of competition which the promoters of the Liverpool Cathedral have decided to inaugurate is certainly not likely to ensure either good and spirited design or that the designer would, in human probability, live to see his design completed."

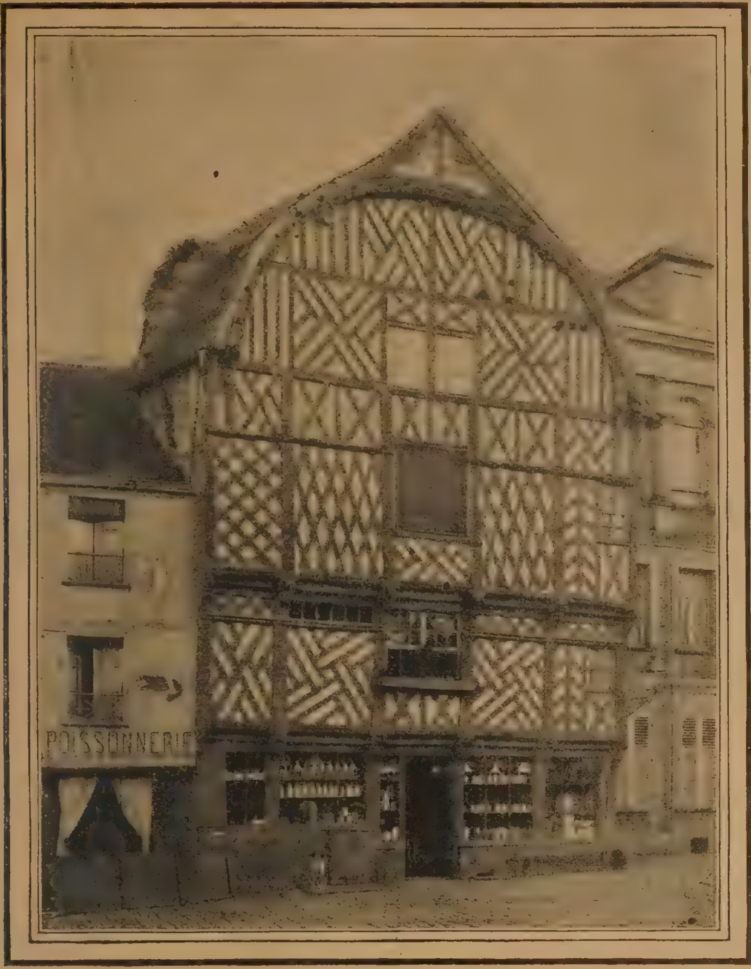

FIG. 20.—HOUSE ON THE GRAND PLACE, ROYE.

LONDON COUNTY COUNCIL.

THE YEAR'S WORK.

At last week's meeting of the Council, the first after the recess, the chairman (Mr. Torrance) delivered an elaborate address dealing with the year's work, in the course of which he said that the whole staff at the central offices now numbered 803, and the crying need for new offices was emphatically illustrated by the fact that more than half the staff of the central offices was housed away from the main building, and in some cases in premises which were quite unfit to be used as offices.

Dealing with the work of the Main Drainage Committee, the chairman said the quantity of sewage dealt with during the year was 81,679,630,537 gallons, 2,424,000 tons of which, in the form of sludge, were taken out to sea Bearing in mind that the main drainage system served a population of 5,147,000, it was not surprising that the Committee's expenditure amounted to £338,561. The Committee had submitted a scheme for the enlargement of the main drainage system at an estimated cost of £2,947,000, in order to provide for the enormous growth in population and to reduce the number of storm-water discharges into the River Thames. Of these proposals the Council had already sanctioned the construction of additional outfall sewers at a cost of about £1,263,000. Portions of the work, estimated at £180,000, had already been commenced, and the remainder would be proceeded with as soon as the necessary arrangements could be completed, the drawings of some portions being well advanced. Experiments were still being made in the bacterial treatment of sewage at the Barking and Crossness Outfall Works.

As to the work of the Bridges Committee, the Rotherhithe Tunnel was rapidly leaving the preliminary stage, and Greenwich Tunnel was half completed. The reconstruction of Vauxhall Bridge was also being proceeded with.

The total nett capital expenditure sanctioned in respect of street improvements was £647,769. The two most important were the new street from Holborn to the Strand, and what was known as the "Westminster Improvement Scheme." In connection with the work of the Improvements Committee, he noted that the total gross expenditure of the Council in respect of the county improvements already sanctioned and now in hand, or about to be undertaken, was estimated at £11,065,207, whilst the nett expenditure, after deducting recoupment, was estimated at £5,202,642.

As to tramways, the Highways Committee had vast schemes in progress and under consideration. It would not rest content until every district in London was properly served with tramways. It was convinced that horse traction was doomed, that electricity must be the future power, and that the conduit system must be adopted.

With regard to the duties of the Building Act Committee, during the year under review 7,389 new buildings were examined, for which fees amounting to nearly £21,000 were received, being the greatest amount in fees received in one year since 1881; 2,966 cases of dangerous structures were dealt with, and 680 summonses were issued in consequence of the failures of owners to comply with the requirements of the Council.

With regard to the future, there was much to do, requiring strong hands and stout hearts. One could not become eloquent on main drainage or bridges, the efficiency of which were both so necessary for health and convenience. When they looked at London they could become sadly pathetic over its congested and sorrowful condition. In their despair they worried the sorely-harassed Housing Committee in its determined effort to solve the heart-breaking problem. Compared with Glasgow, a city within itself, sending its beautiful electric cars to every corner of its wide domain, its fine bridges, rationally and sensibly used for the good of the whole community, the condition of London, with its conflicting chaos of interests, where the toiler was daily at his wits' end to know how to get to or from his work, made one grow indignant. They inherited their Augean stable. There was no Hercules now. But there had been determination and resolution, and London was brighter and better than it was.

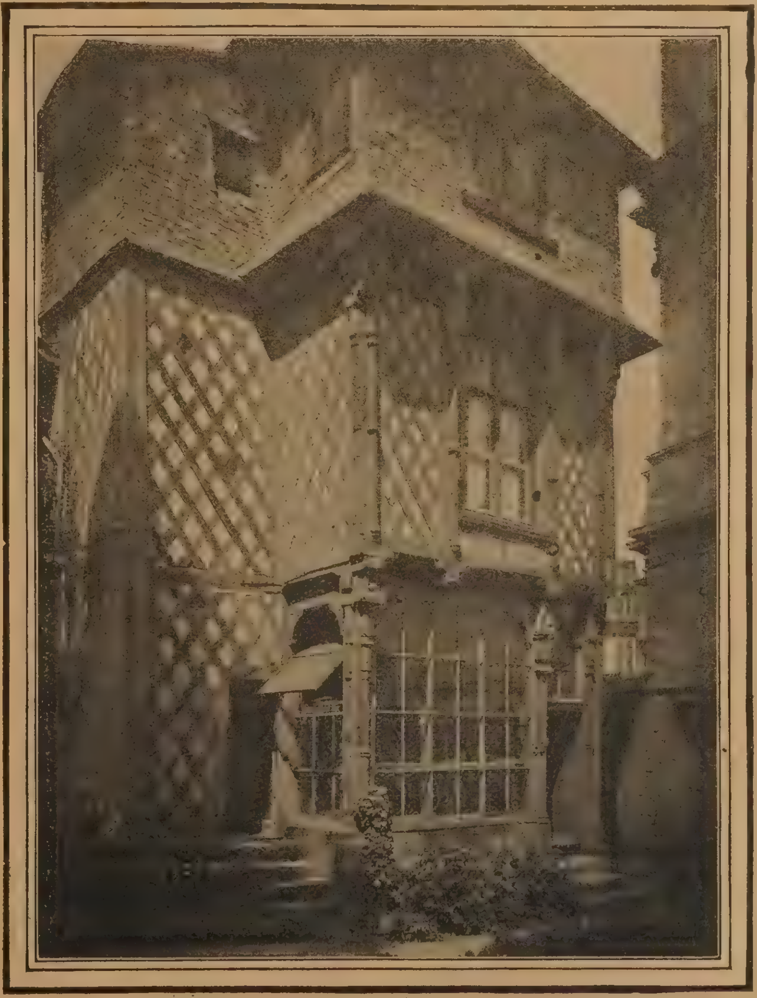

FIG. 19.—HOUSE NEAR THE CATHEDRAL, RENNES.

Law Cases.

Air-Space and New Buildings.—At the Hove Police Court on October 7th William Lawkin Duck was summoned for contravening by-law 62 with respect to new buildings at 13, Highdown Road, Hove. Mr. Woolley (for the Corporation) explained that the case was an infringement of the by-laws relating to the provision of air-space. When the building was first seen in April last it was resting on the ground and had a corrugated iron roof. It was encroaching on the air-space allocated to the house. The defendant's attention was called to the matter, and in the following May stated that he would put the building on wheels. This was done, and the roof was also taken off. The roof, however, was still remaining as it was piled at the side of the building. The latter was described as a portable under-carriage for a motor, but how it could be such Mr. Woolley said he did not know, as there was no flooring to it. The building was practically but a shelter for a motor car. William Purchase, assistant borough surveyor, said the building was built of combustible material, and no plans had been sent for approval to the council. Mr. Marx, addressing the bench on behalf of his client, contended that no offence had been committed within the meaning of the by-laws. Mr. E. D. Long, of Brighton, architect and surveyor, said that the structure could not be described as a building, as there was no floor, no roof, and it was on wheels. He found that the extent of the air-space was 380ft. super. The by-law required that there should be 300ft. for air-space; and as the erection did not occupy 80ft. super. there was still an excess of the air-space required by the by-law. The magistrates unanimously came to the conclusion that this building was one within the meaning of the by-law, and they found that it was an infringement of the by-law with regard to the air-space. There would be a penalty of 20s. and costs.

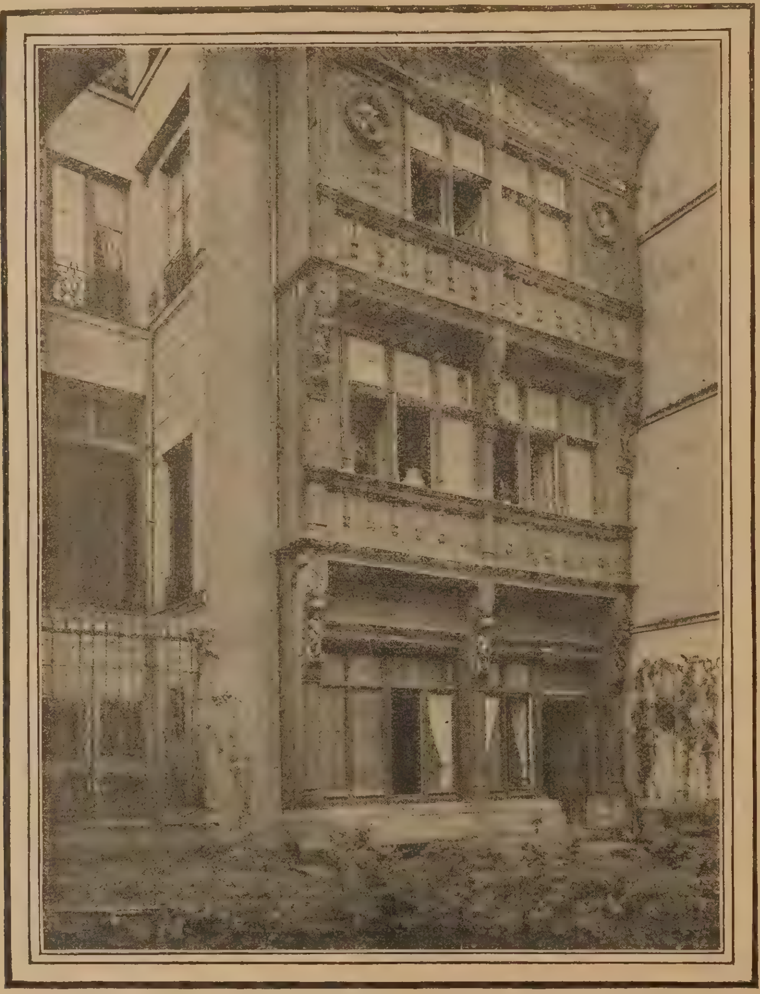

FIG. 21.—WOODEN HOUSE AT ROUEN.

Messrs. Antill & Co.'s Bankruptcy.—A sitting for public examination was held in the Court of Bankruptcy last week in the case of William Antill, A. W. Peterson and W. H. & E. A. Young, builders, of Mornington Crescent, Camden Town, carrying on business as W. Antill & Co. The liabilities are returned at £10,211, against available assets £7,462. The failure was attributed to loss on trading, but the Official Receiver suggested that the debtors had contributed to their insolvency by excessive drawings since 1900. The examination was concluded.

A Question of Stairs in a Bonded Store.—A case of considerable interest to builders recently came before the Kinning Park Dean of Guild Court, Glasgow. It was an application for lining by Messrs. Slater, Rodger & Co., Ltd., to erect bonded stores at the south-east corner of West Scotland Street and St. James's Street, Glasgow, on ground recently occupied by the Birkenshaw Coal Co. The plans showed only one flight of stairs leading to the upper storeys of the building, and to this the court took objection. They alleged that the exit for employees, in the event of an outbreak of fire, was totally inadequate. The petitioners, however, pointed out that there would only be three persons engaged in the upper storeys of the building, and further that these workmen must necessarily be under the supervision of the Customs officers, and they could not be so if there were more than one flight of stairs. The court were of opinion that it would be advantageous, as well as adding to the safety of the employees, were a spiral staircase placed at each end of the building. To this petitioners demurred as being unnecessary. After expert evidence had been led, the court agreed to pass the plans on condition that the stair in question was removed 20ft. south and a fireproof passage constructed from the foot of the stair to the street.

Correspondence.

A Friendly Criticism.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—I should like, if you will allow me, to make a friendly criticism of the designs by Mr. A. J. Hardwick and Mr. H. Atkin Berry published as centre plates in your issue for October 2nd.

The plan of the house at Roehampton has some commendable features. The sitting-room hall would be a useful and pleasant place, especially in summer; but to make this type of house really snug and comfortable the staircase should be well cut off to avoid draughts. The elevations are well treated, but I think the roof over the dining-room might be constructed so as to avoid the central gutter, which, in nine cases out of ten, is a constant source of trouble to the occupant. The plan would be improved if the doors to the drawing- and dining-rooms were not placed so much in line with the fireplaces. With a French casement to the dining-room bay window the side-entrance door might be omitted and this space more usefully occupied by a pantry. The back stairs should be placed along the hall wall, and a small ante formed where the cupboard is shown; this would give access to the kitchen and back stairs as well, it would cut off all smells, and would not encroach so much upon the floor-space of the kitchen. The scullery is very small, and no pantry is shown, and with such a high wall the verandah would be practically useless. Why a wall at all?

A good attempt is made in the plans of the houses at Ditton Road, Surbiton, to give a roomy entrance hall instead of a long staircase passage, so common in houses of this kind. The square bay and angle fireplace would be a very pleasing feature, and would give character to the house. In semi-detached houses it is a good plan to run the party wall out as far as the line of bay (as is done in the drawing-room in these plans) to avoid being overlooked by your neighbour and to save space in the rooms. The kitchen door should not enter direct from the hall, nor is a porch required to the back door; this space might be added to the coal place, and a small space for hats and coats taken from it. If the kitchen were placed where the scullery is shown and the latter put against the dining-room wall, a small ante could be arranged and cut off by a swing door. In this plan the scullery is very small, and little provision made for a pantry, &c.

The house at Warlingham, Surrey is, very sensibly treated and suitable for a country district. From the elevations one might expect it to be well planned. It is a pity that no plan is given, as so much depends upon the internal arrangement.

These criticisms are offered in a friendly spirit, and must be taken for what they are worth, but I have long been of the opinion that a criticism upon plans illustrated from time to time would be of great advantage, especially to the younger members of the profession.—Yours truly, X.

[We shall be glad to consider criticisms of any other designs which readers may care to submit. With regard to our correspondent's remarks about the plans of the house at Warlingham, we may say that when application was made to the architect for them he replied that he did not wish the plans to be published.—ED. B. J.]

"The Magazine of Art."

To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—If Mr. B. W. Dexter will kindly re-read my note under this heading in your issue for October 2nd he will see my reference was to the first three volumes of this publication, which contain neither date, preface nor any indication of the time of issue. Mr. Dexter's possession of the original forel in which the first actual monthly number was issued is additionally interesting, and is evidence conclusive that the work was not originally issued, as assumed, in the first month of 1878. This goes to show therefore that the volume for that date—although it contains nothing to suggest the fact—does not embrace twelve monthly numbers, but only eight.—Yours truly, HARRY HEMS.

THE PRESIDENT'S ADDRESS TO THE ARCHITECTURAL ASSOCIATION.

THE annual general meeting of the Architectural Association was held on Friday evening last at 9, Conduit Street, W., the chair being occupied by the president, Mr. W. Howard Seth-Smith, F.R.I.B.A. After the minutes of the last meeting had been confirmed, Mr. Edward W. Mountford moved the acceptance of the committee's report and balance-sheet for the past session. This was seconded by Mr. Baggallay, and carried unanimously. Mr. F R. Herring (Clapham) and Mr. T. H. Swinyard (London, N.) were then elected members of the Association, after which the president moved a vote of thanks to the Royal Institute of British Architects for its tenth annual grant of £100 towards the educational work of the Association, and also a vote of thanks to Mrs. Cates for presenting books bequeathed by the late Mr. Arthur Cates. A vote of condolence with the relatives of the late Mr. James Brooks was also moved. The prizes won by students during the past session were then distributed, after which the secretary announced that the annual conversazione would be held on October 25th at the Institute of Painters in Water Colours in Piccadilly, at 8 p.m. The president then read his inaugural address. He said that the past session had been one of unparalleled prosperity, clouded only by the losses sustained by death, which claimed eight members. But the passing of some men left so great a void that the whole complexion of things was altered. Such men were John McKean Brydon, Arthur Cates and William Young; and they could be paid no higher tribute than to say that they possessed that admiration and trust to which their professional attainments as well as their personal goodness entitled them.

During the past session success had attended all departments of their work, 116 new names having been added to the membership roll and six members re-instated, while the financial position was the best on record. The Sketch-Book, which for thirty-five years had figured so largely in connection with the work of the Association, and which had hitherto been produced by an independent committee (with Mr. William G. B. Lewis and Mr. William A. Pite as editors, and Mr. Edgar H. Selby as treasurer and secretary), had, at the request of these gentlemen, been taken over by the general committee, in whose hands it ought to become a valuable property.

Continuing, Mr. Seth-Smith said:—

The Day School.

The past history of this Association is a history of education. In accordance with its traditions we have, during the session just closed, tried to meet the demands of the profession and of the public for better education as far as those demands can safely be ascertained by a careful review of art-feeling in the community, and the growing sense in the profession that with us lies in great measure the responsibility for raising public taste in building. This sense of the beautiful can only grow as it is nurtured by observing the objects of beauty it is our function to create. You have, after mature consideration, added to the curricula a day school, and with its opening next week, we enter upon a course entailing increased responsibility upon this association. You are probably all conversant with the general principle of which this school is the outcome, namely, that if a young man is not to waste his employer's and his own time it cannot possibly be a good thing that he should be plunged into a busy office without some preliminary training. It is difficult to imagine on what grounds such a principle can be objected to. We are happy in having secured the services of Mr. Arthur Bolton as headmaster of this school. In his hands it is sure to grow and prosper as the evening studio has done under Mr. Lewis's direction. We feel satisfied it will receive the encouragement of the profession. Success depends on this. I would urge young men whose bent is towards architecture to enter this school, either directly or by agreement with the principals to whom they may wish to be articled. I believe most principals of standing will be found willing to give such pupils as may be unable to attend the evening school facilities for attendance, if not regularly, at any rate for two or three terms at stated hours for certain courses they particularly need. Such an arrangement will be as advantageous to them as to their pupils, while those whose minds are not fully committed to this line in life will, by entering the school, have an opportunity of re-considering their decision in the light of experience.

In no better way than by mingling socially and educationally as they do here with a body of enthusiastic fellow students and practising architects can men become emulous of the highest excellence. Nor, indeed, can they ascertain their own true level except by thus comparing themselves with those less, or more, gifted. All this gives a unique value to our association as a training ground.

Cramming.

A word here to our students in both evening and day schools. The committee too often observe a desire to go up for the R.I.B.A. examination after only a few months' direct preparation. This means cramming; cramming means working at high pressure, and high pressure, as surely as a neglected education, spells failure; not perhaps in passing the formal test, but in practical success in after life, which every student will admit is the real goal of professional education. The A. A. will, I hope, never be a party to this sort of thing. You must go elsewhere if you want it. It is not education at all. Passing the examination will make a man neither a skilled draughtsman nor a good builder; but if he masters these essentials his success is assured, and they can only be attained by a long and patient course of work, systematised as carefully as it has been by this Association. Above all things believe that no system, however complete, can teach you architecture; at its best it can but provide conditions suited to work, and teach you where and how to learn. Your education—your mental development—will be the result of your effort to apply the information offered and to work it out for yourselves.

The Ethics of Examination.

If the diploma (membership) is sought merely as the Institute's assurance to the world that you have had such a systematic training; as a guide to the subjects which it is necessary to know, and as an incentive to work at them; surely nothing but good can come of the examination which qualifies for that diploma. Let Emerson's testimony to our national character, written fifty years ago, inspire us to-day. In England he says: "Every man is trained to some one art or detail and aims at perfection in that; not content unless he has something in which he surpasses all other men. He would rather not do anything at all than not do it well. I suppose no other people have such thoroughness."

Generalization and Specialization.

As our art has a technical basis, this Association, if it is to become the educational power it aims to be, must act upon the universally admitted dictum so well expressed recently by Sir John Gorst that, technical instruction cannot possibly be assimilated by a student unless a proper foundation has previously been laid by a thorough grounding of elementary and secondary instruction. Surely this is also true of art. The more thorough an artist's general education the more alert will be his mind in all directions and the more rapidly will he appropriate and assimilate the special knowledge needed to fit him for his chosen life-work. I therefore hope that the Committee will before long see their way to make admission to this day school conditional upon passing the R.I.B.A. preliminary examination or its exempting qualifications. And what is true of a broad grounding in general education in youth is equally true

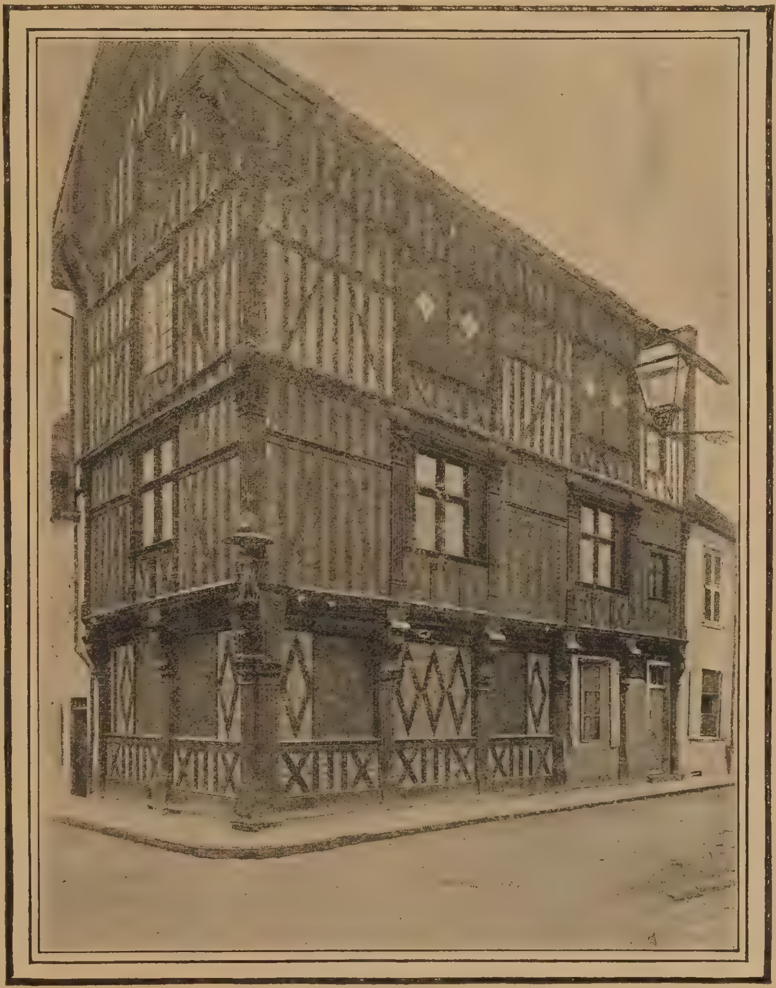

FIG. 22.—WOODEN HOUSE AT BAR-SUR-SEINE, AUBE.

of early professional training. You must not specialize until you have some knowledge of every subject essential to the practice of every ordinary architect. The Association has been most careful not to introduce into its curricula any subject which does not come under this category.

Mr. Lethaby and his Paper.

Perhaps the most striking contribution during the past year to the discussion of this great question was Professor W. R. Lethaby's paper read before the R.I.B.A. entitled "Education in Building." It is an able history of the conditions under which architecture was carried on in the Middle Ages and up to the time of the Renaissance. He exhorts us by every means within our reach to encourage a high standard of practical excellence on the part of our executants (the British workmen) and to see to it that we ourselves not only understand building construction as the A. B. C. of our profession, but that we endeavour to bring about a more co-operative spirit as between architect, builder, and mechanic.

But even supposing the buildings of those times were not under the control of a "magister" who designed and commanded, but were the creation of an "operator ipse magister," as contended by Mr. Lethaby, he appears to us to under-rate the effects of the vast social and educational change the whole community has undergone since the days of which he writes, and the impossibility of adjusting the old customs to modern requirements. Then it was only the King, the clergy and the nobility who were patrons of the building art. We now have a very numerous and educated upper middle-class who can afford to build. Their travelling and knowledge makes them critics in the matters of art, and anxious to imitate the ancient work they have seen.

The Architect: The Artisan.

All this has resulted in a demand that those they employ to design and direct their projects shall be of their own class; shall know more than they themselves of the history and structure of these admirable works of old; and shall build with an approximation to the same feeling —shall in fact be scientific where they are dilettante. Professionalism is the expression of this demand for a high standard of training. Professional men, including those whose function is design and draughtsmanship, have come to stay. They form a large section of the upper middle-class and they are largely employed not only by those of their own and of higher social status, but also by the numerous bodies representative of all classes alike, who prefer to be advised (in carrying out complicated architectural problems unknown to mediævalists) by men who have been thoroughly trained, through long years and at great cost, in the art of planning and in the knowledge of building construction, rather than by mechanics, whose blunders, inevitable where several trades are working without a general superintendent, would not be tolerated in these days of scientific method and exactitude.

Not enough Specialization.

It is a fault in our training that our pupils are not on the works enough, and that we do not specialize enough. Highly-trained men, with a diploma from a guild or an institute or what not, ought really, if our building is to be of our best, to confine themselves to design and the supervision of building construction, and not to meddle with surveying, valuations and dilapidations, bills, &c., work which certainly does not savour of art. When as a profession we are more thoroughly trained, and when our occupation has obtained legal protection from the competition of unqualified persons, we shall be in a position to adopt more generally this higher standard of work. And when the last of these conditions is established the first will naturally follow and the public will employ us more generally.

Architectural Registration.

The absolute necessity of some protection of the title of architect and its confinement to duly trained men is being more widely felt every year. In addition to the striking unanimity of Continental professional opinion which I mentioned a twelvemonth ago, we now have the weighty and closely-reasoned pronouncement of the President of the Institute in favour of something of the kind. The Institute's policy, since the establishment of the examinations, is incomprehensible and illogical, excepting as based on this principle. After all, the proposal is only that the State should give us a justly-acquired right to the expensively-acquired skill and knowledge which it demands in the same spirit as it did to the mediæval Guilds, but in the manner dictated by the political and social conditions of to-day.

Funds Needed for New Premises.

Gentlemen, if this Association is not to experience a serious check in its useful career, we must now apply ourselves heart and soul to settling the vexed question of new premises.

We must be prepared to collect the whole cost of building and equipment, and other expenses, a sum amounting (according to the two last building schemes gone into by the Premises Committee) to at least £15,000. This estimate allows nothing for luxury, but would provide merely a simple building well-designed to suit its purpose. The Committee believe they already see their way to something like £3,000 within the next three years. If every member of the Association would kindly undertake to collect (not necessarily to give) at least a guinea this session we should have made a start, without external help, to the extent of about £5,000.

Supposing our anticipations are realised so far, there ought to be no great difficulty in raising another £5,000 from other sources within the present session, and with £10,000 we might go forward in anticipation that a scheme so well inaugurated would be the best further appeal to the liberality of the profession and lovers of our art, and we might then reasonably expect to open our building free of debt within three years from the present date.

A Quotation from Martineau.

In concluding his address the President quoted at some length from Martineau, the substance of which is summed up in the following sentences relative to the architecture of the ancients: "the buildings devoted to the convenience of the body are for the most part gone; while those that represent ideas of the mind are standing yet. The provision for shelter, the places of traffic, the treasuries of wealth, the home of domestic life . . . have crumbled into the dust . . . but the temple answering to the sense of the Infinite and Holy, the rock-hewn sepulchre where love and mystery blended into a twilight of surmise; the column or the bust of civic praise, grateful for services to the commonwealth; these survive the shock of war and the waste of centuries, and testify that religion, love and honour for the good are inextinguishable."

Yet, as students, said Mr. Seth-Smith, we chafed under the long and patient training required to educate this high faculty, and as a class of artists we sometimes allowed our enthusiasm to suffer because national taste was so slow in developing. No one would deny that the art of the European Renaissance was a higher and nobler thing than that of the New Zealand Maoris, or assert that the art of Greece was produced in spite of the high intellect and civilization of that people. Let it suffice that we were progressing and that time must be allowed in proportion to the excellence of our art. To us belonged only the responsibility of doing our best by cherishing at all costs the highest ideas and cultivating our personal talents to their utmost capacity.

In moving a vote of thanks to the president for his address, Professor Beresford Pite congratulated the Association on the students' designs exhibited around them. Such work had vastly improved during recent years, and it was rather an important indication of what was being done in architecture, for many of the students who produced the designs were in the offices of well-known architects, whose work they reflected. He took exception to the last remark in the president's address, that we chafed under the long and patient training in design. The period of studentship was the happiest in the life of an architect, and he urged that unless the architectural student found real pleasure in his work it would be better for him to give it up. Every scheme of architectural education would fail if it did not engender enthusiasm in architecture is a fine art. Students should examine the buildings in their own district and cultivate enthusiasm for the great men—such as Cockerell or Burges, or the greater men of the Renaissance. They should never be satisfied with themselves. Undoubtedly, as had been said, an architect's best friend was his india-rubber, for the work rubbed out was always your best work. Mr. Francis Hooper, F.R.I.B.A., seconded the vote of thanks, which was carried with acclamation. The president replied, and the meeting then terminated.

New Patents.

These patients are open to opposition until November 18th.

1900.—Sewer Ventilation.—10,649. J. Maden, Macefield Villas, Old Hill, Staffs. A fan blower is employed to draw the gas out of the sewers and to force it up suitable conduits into the open air at a height where it can be discharged without giving offence. According to one modification, the fan is driven by a water-wheel actuated by the flowing sewage.

Condensation on Shop Windows.—17,835. A. C. Page, 66, Palatine Road, Stoke Newington, London, N. The window is constructed of two sheets of glass about 1in. apart. The air enclosed between acts as a non-conductor and prevents condensation.

Roller Blinds.—19,093. J. Adams, 28, Stanley Street, Bedford. Each end of the roller has a tightly-fitting adjustable cap with an indent or recess for the blind lath, which is first inserted in its hem, then laid on the roller, and there held by the caps.

Door Knobs.—20,097. T. H. Blenkin and S. G. Ward, 32 & 33, Cleveland Road, Wolverhampton. The knob is hollow, and has at its end a rubber ball or a pad of other soft material so that no damage is done to the wall should the door be violently thrown open.

Metal Troughs for Electric Mains.—20,197. M. Lachman, 29, Gillingham Street, London, S.W. The troughs are made of rolled sheet metal, and the side walls have their ends curled back on themselves. The lengths are connected together by metal clips driven on the two adjacent ends.

1901.—Motor Street-Sweepers.—1,704. J. T Collins, 238, Laurel Street, Hartford, Connecticut, U.S.A. This street-sweeper is self-propelled, and has an arrangement by which the traction wheels and the brush may be concurrently or independently rotated in opposite directions; means are also provided for spraying fluid in advance and at opposite ends of the brush.

The following specifications were published on Saturday last, and are open to opposition until November 25th. The names in italics are those of communicators of inventions. A summary of the more important of them will be given next week.

1900.—12,935, Frame, Hickson & Goldie, ventilating rooms. 16,531, Jannetaz, double-acting hydraulic press for pressing and moulding artificial stone. 16,733, Gustorf, roofing tiles. 16,793, McDonald, brackets for flushing cisterns. 17,008, Lee, window. 19,750, Naylor, holding-down bolts. 20,678, Waine, door locks and latches. 20,874, Milo & Richardson, decorative treatment of wooden surfaces. 21,264, Taylor, grates for economising fuel and consuming smoke. 21,408, Taylor, draught-excluder for doors. 21,799, Sangwin, steps of buildings. 23,084, Knight, machine for laying bricks on buildings.

1901.—3,851, Kemp, Venetian blinds. 6,414, Barnett, fresh-air inlet for ventilating drains and sewers. 7,082, Dobney & Calah, holding sliding window-sashes. 7,286, Sharpe & Code, acetylene gas apparatus. 12,079, Woolhouse & Chrimes, automatic flushing apparatus. 13,013, Kramer, device for securing windows in an open position. 13,936, Bollé (*Pflaum & Gerlach*), sectional hot-water boilers. 16,025, Hörenz, combination ventilator and turbine driver. 16,504, Lloyd & Brooks, draw-off cocks and valves.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication

Clay-Modelling.

Northampton.—Goth writes: "I wish to learn clay-modelling so that I may better understand architectural details. Kindly name a book dealing fully with the subject."

There are several books that deal meagrely with this subject (there is a chapter on modelling in Millar's "Plastering: Plain and Decorative"), but the best and quickest plan is to get personal instruction. You can obtain much help, however, so far as design is concerned, from books on sculpture, such as Mitchell's "History of Ancient Sculpture" (Kegan Paul & Co.) and Gardner's "Handbook of Greek Sculpture" (Macmillan & Co., price 10s.).

Doric Order of the Temple of Theseus.

Newport.—Groudle writes: "In the Doric Order of the Temple of Theseus, Athens, does the centre of the triglyph come over the centre of the column?"

Yes.

Proportions of Tall Chimneys.

Devonport.—Beginner writes: "Please give formula (without trigonometrical functions) for calculating the thicknesses of a square chimney 90ft. high, 5ft. 6in. wide at the base and 3ft. 6in. at the top, to withstand a wind-pressure of 40lb. per sq. ft. It is to be built of bricks. Assume weight to be 110lb. per cub. ft."

If a tall chimney is made of the ordinary proportions it is usually strong enough without any special calculations. These proportions are 1-brick thick at top, and increased ½-brick in thickness every 20ft. down. Above 120ft. high the top length will be 1½-bricks thick. Cornice or cap not to project more than thickness of brickwork. Width of base to be at least one-tenth of height for square shaft and one-twelfth for circular shaft. Firebrick lining to be independent of brickwork of shaft, and to have 2in. space between. Interior sectional area to be uniform at each set off. Shaft to batter 2½in. in every 10ft. of height. For important cases full calculations should be made. For a square chimney 90ft. high the base must be at least 9ft. by 9ft., notwithstanding that if the top is 3ft. 6in. square outside a batter of 2½in. per ft. will only make the base at ground line 7ft. 3in. square; so that it is evident for this case the batter must be increased to 3¾in. per 10ft. on each face. HENRY ADAMS.

Cast-Iron Bridge Girder.

Sunderland.—Enquirer writes: "I understand that the shearing strain at any point in the web of a flanged girder is equal to the amount of load passing through that point to the support, and that the shearing strain due to a distributed load on a girder is nil at the centre and equal to half the total distributed load at each abutment. In designing a cast-iron girder, why is the depth of the girder diminished towards the abutment when the strain is greater and the flanges are the same throughout?"

The statement as to shearing stress is perfectly correct. In the case of the cast-iron parabolic bridge girder the flanges take the longitudinal stresses, or tension and compression, but being of uniform section the depth is reduced as ordinates to a parabola so that the stress throughout may be uniform. The web takes the shearing stress, but from practical considerations of foundry work it is necessary to make it much stronger than the stress requires. At the ends, where the depth to meet the longitudinal stress is nil, the sectional area of flanges alone is sufficient to provide for the shearing stress, but it is usual to give a depth of 6in. or 7in. for sake of appearance. HENRY ADAMS.

War Office Surveyors' Examination.

Devonport.—Beginner writes: "Would Twisden's 'Practical Mechanics' be a good addition to the library of anyone who intended entering for a Civil Service examination, such as that of surveyor to the War Office?"

Twisden's "Practical Mechanics" is a good book, but rather out of date; certainly no harm can be done by working through it, but many new terms have been introduced into mechanics since this book was written. Taylor's "Theoretical Mechanics—Solids" and Taylor's "Theoretical Mechanics—Fluids" (Longmans, 2s. 6d. each) will on the whole be found more suitable. Perry's "Practical Mathematics" (Eyre & Spottiswoode, 6d.) is an essential addition for all modern examinations. HENRY ADAMS.

Portable Stage.

Lancaster.—Anxious writes at great length and in a most illegible manner with reference to a portable stage, though it is particularly requested that correspondents should be as brief as possible; moreover, he gives an address which, when used, results in a letter being returned "Gone away." Considering the trouble which a reply to his enquiry involves, this is certainly a most discourteous method of making use of our columns.

So far as can be made out from this correspondent's eccentric writing he has to construct an open-air stage to be built of wood and used for acrobatic performances upon three days and then taken down, packed, and stored away for similar use in subsequent years. Although only used on three days it will of course need to be as strong as if used all the year round. The arrangement of framing at front of shelter may be as shown in Fig. 1, where A B is a space 10ft. wide, left level for attachment of trapeze, C D side-post, B E one strut or brace, F D another strut, and C G a third strut, all bolted through at G and also at the other ends. As the trapeze may carry three heavy men, say 5 cwt., and the load may be suddenly applied, making it double the points A and B will each have 5 cwt. But the beam may have the whole load of 10 cwt. occasionally applied at the centre, and there will be a distributed load of, say, 25 cwt., due to weight of structure, snow, wind, &c., or say an equivalent to a total of 60 cwt. in centre; and allowing a factor of safety of 6, the breaking weight should

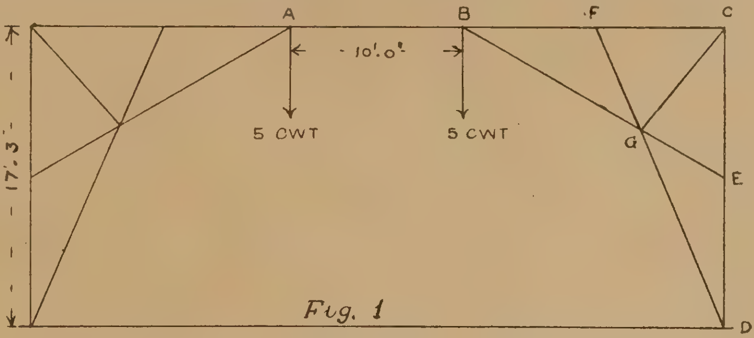

Fig. 1

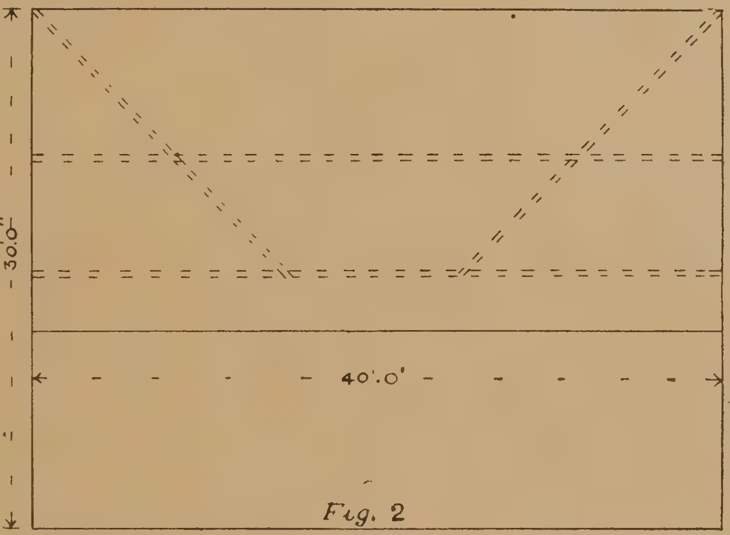

Fig. 2

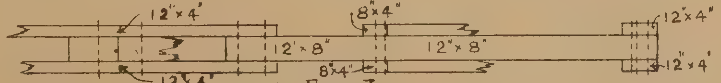

Fig. 3

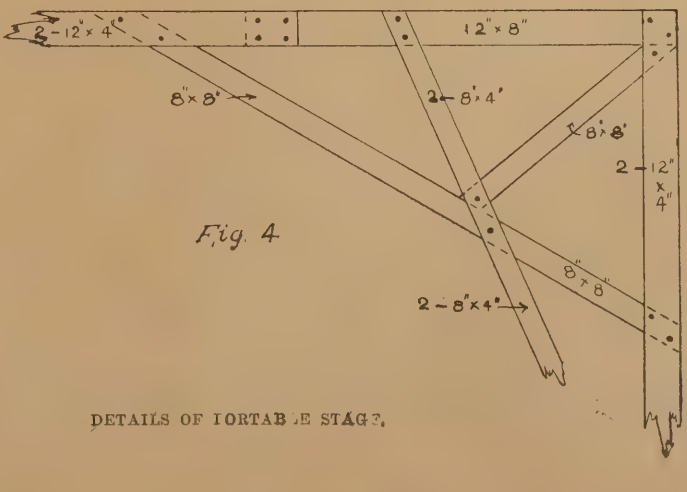

Fig. 4

DETAILS OF PORTABLE STAGE.

be 360 cwt. in centre. Then $W = \frac{cbd^2}{L}$, whence $bd^2 = \frac{WL}{c} = \frac{360 \times 10}{3\cdot6} = 1{,}000$, therefore say 12 × 8. The timbers of this frame may be arranged as shown in enlarged detail, Fig. 3. The sides and back of the structure will need cross-bracing, and the main beam and roof should be stiffened by timbers (see Fig. 2) notched under purlin and bolted at ends. The remainder of the work is ordinary architectural design for which a local architect may be consulted. HENRY ADAMS.

Making Architectural Models.

PARKSTONE.—TURPENTINE writes: "Kindly inform me how to make a pasteboard model of a house. Can I cut the roof and walls from two sheets of board only? Are there any books on the subject?"

Querist does not state to what scale he wishes to make his model or how high the building is; it is therefore impossible to say what size cardboard he requires. I would, however, suggest that he obtains a demy or royal Bristol board six-sheet or eight-sheet thick. The plan should be traced on paper or cloth and then stuck down around the outside edges on a board. The elevation should then be drawn straight on the Bristol board, coloured, cut out, and stuck carefully down to the outline tracing, care being taken to fix small pieces of wood or cardboard inside all the corners for strength. When the walls are all stuck up a knife should be run round the building, which should come off the board. The tracing paper or cloth can then be pulled away from the cardboard and the roof set up and glued on from the inside. Chimneys and ventilators should be cut out of wood, and paper pasted round them and coloured. The model will then be ready to be fixed down on a board, when the surroundings can be added, using green felt or baize for grass and colouring the ground for the paths, or gumming and sprinkling on fine gravel, waiting until it has dried before brushing off. The only book on the subject which I know of is "The Art of Architectural Modelling in Paper," by T. A. Richardson. It can be purchased of Messrs. T. A. Richardson, of High Holborn. JOHN B. THORP.

Cost of Roadmaking.

MANCHESTER. — MACADAM writes: "(1) What is a fair price for kerbing, flagging, channelling and tar macadamising a suburban road outside Manchester—how much per lineal foot or yard? (2) Has a district council power to charge what it likes for roadmaking of this character, and to accept any tender without consulting the property owners? (3) Can the district council add to the charge for roadmaking interest at the rate of 4 per cent on the total sum charged for roadmaking, the interest accruing against the property owners during the time taken in roadmaking, that time being long or short according to the whim of the district council? (4) Is not 17s. 6d. per yard an exhorbitant price for kerbing, flagging, channelling and tar macadamising a road in a new suburban district?"

(1) The prices of roadmaking materials depend very largely upon the locality and the facilities for obtaining them. The following prices, however, may be taked as approximate and serve as a guide:—

6in. by 12in. edge pennant curbing	5s. 8d. per yd. laid.
12in. by [illegible]in. flat granite „	6s. 6d. „ „ „
Flagging—patent Victoria stone	6s. 3d. per super. yd.
York stone flagging	6s. to 7s. „ „
Brick paving	3s. 6d. „ „
Tar pavement	3s. to 4s. „ „

according to local facilities for manufacture.

Channelling, if of 6in. by 4in. granite blocks on concrete, would cost about 16s. to 18s. per sq. yd. Channelling of 12in. by 4in. pennant stone costs about 3s. per yd. run. Tar macadamising (exclusive of foundation), 2s. 6d. to 3s. 6d. per sq. yd. run. Tar macadamising preparing foundation, from 3d. to 6d. per sq. yd. In the making-up of a suburban roadway under the Private Street Works Acts, the cost per ft. of frontage will depend, of course, entirely upon the works executed in the street and whether sewers are included, &c. Under ordinary circumstances, where there are no very exceptional works involved, the cost per ft. of frontage frequently ranges from about 9s. to 15s. for a road 50ft. wide. (2) With regard to the powers of a district council in the making-up of a "private street" (for we assume this is what our correspondent refers to), this depends upon the Act under which the authority is proceeding. The powers for making-up "private streets" are to be found in the 150th section of the Public Health Act, 1875, and in the Private Street Works Act, 1892, and to these reference should be made. Under the latter Act the authority has power to proceed to make up the street without affording the owners the option of doing the work themselves, as is provided in the Act first named. There is no obligation to consult the owners before accepting a tender. (3) By the Private Street Works Act, 1892, section 9 (2), it is provided that "the authority in any estimate of the expenses of private street works may include a commission not exceeding £5 per centum (in addition to the estimated actual cost) in respect of surveys, superintendence and notices." And again, by section 14 of the same Act, after the "final apportionment has been made, the owner stands charged with the sum due from him in respect of such works," together with interest at a rate not exceeding £4 per centum per annum from the date of the final apportionment till payment thereof." This interest does not commence until the work has been completed and the *final* apportionment has been served. (4) If our correspondent means 17s. 6d. per yard of frontage to the street, this price does not appear to us at all excessive for, say, a road 35ft. in width if works of curbing, channelling, roadmaking and paving have to be carried out; but it is impossible to give any definite opinion without knowing the class of work and material specified and the width of roadway, &c. W. H. M.

Dimensions of Assembly Hall.

HULL.—J. R. A. writes: "Which is the best way to calculate the dimensions of an assembly hall to seat a given number of people? Is there a book published dealing with this class of building?"

The usual allowance for seating accommodation is 1ft. 10in. wide by 2ft. 6in. from front to back per sitting, but a more reasonable size is 2ft. by 3ft. Including gangways, 7ft. super. should be taken as the unit. We do not know of any book specially dealing with the subject.

Tests for Lime and Cement.

BIRMINGHAM — COMPO writes: "Kindly mention a good simple test for the quality of lime and cement."

Test for limes:—Wet the lime; if it slakes in a few minutes with decrepitation and much heat, cracking and ebullition of vapour, it is a poor, feebly hydraulic, lime; if it shows no sign of slaking for an hour or more, then cracks all over with development of heat, but no decrepitation, it is hydraulic and very suitable for mortar; if it is very difficult to slake, and develops hardly any heat, with little or no cracking or powdering, it is eminently hydraulic. These varieties harden as follows: the first is firm in fifteen to twenty days, the second in six or eight days, and the last is firm in twenty hours and hard in two to four days. A rough test for cement was given on p. 245 of our issue for May 1st last.

Book on Timber.

BIRMINGHAM—BRAND writes: "Please name a good book on timber."

"Timber and Timber Trees, Native and Foreign," by Thomas Laslett (B. T. Batsford, 94, High Holborn, W.C.; price 7s.).

Wall Gardens.

RADLETT, HERTS.—GARDEN writes: "In your notice of Miss Jekyll's new book in your issue for September 11th you conclude the first paragraph by saying that in almost every locality stone can be easily obtained . . . . if not, chalk can be used. I should like to know (1) whether stone can be obtained anywhere in this county, and (2) whether chalk is suitable for building a bank at an angle of about 60 degs. with the ground, spaces being left for soil? Would not chalk crumble with rain and frost?"

(1) We do not know of any hard stone quarried in Hertfordshire, but in the chalk quarries a hard variety called clunch is found, and is very suitable for rock walls. In fact St. Albans Cathedral is partly built of material obtained from a hard layer at the top of the chalk marl, called Totternhoe stone. (2) The hard chalk we have named is suitable, and if built thick enough the rain and frost will not materially affect it for very many years. If, however, you do not care to use it you might use bricks for the rough-walled garden bank.

Cheap Tapestry for Wall Decoration.

LEAMINGTON.—Q. & C. write: "Where can we obtain the cheap tapestry seen in public billiard-rooms, &c.?"

Carlhian & Beaumetz, 73, Great Eastern Street, E.C.; E. Jullien, 2, Osnaburgh Terrace, Regent's Park, N.W.; A. H. Lee, 10, Oxford Circus Avenue, 231, Oxford Street, W.; Emile Pinchon, 3, Oxford Circus Avenue; J. W. Morris, 17, Berners Street, W.

Rendering Tank Watertight.

GREENOCK.—Q. T. writes: "A friend of mine has just completed a septic tank, which he has excavated in the grounds of a large mansion. The bottom and walls were lined with Portland cement—concrete 9in. thick and then finished with plastered cement—all good hard material; but he now finds that the water oozes away. Can you suggest any waterproof coating which may be put on with a brush, or can you suggest any remedy to make the tank watertight?"

We are unable to recommend any material or solution which is capable of application by means of a brush, so as to make this tank absolutely watertight. The most satisfactory remedy would be to line the bottom and sides of the tank with mastic asphalt, finished on the inside with a skin of brickwork 4½in. thick, and rendered on the face with cement. T. E. C.

TO READERS.—Within the last month no fewer than half a dozen letters have been returned to us through the Dead Letter Office when sent to the addresses given by correspondents who desired to make use of our "Enquiries Answered." We cannot understand why such false addresses should have been given, but we consider such action unworthy of anyone with a sense of ordinary courtesy.

Masters and Men.

The Swansea Builders' Labourers on Strike at a recent meeting discussed the latest terms of settlement offered, and decided that they would return to work on a farthing advance, to be given in May next, but declined to sign on for any terms of years as suggested.

Dundee Masons for Paisley.—A large batch of masons arrived in Paisley recently from Edinburgh and Dundee districts to take the places of the Paisley men, who are on strike. The masters stated that they expected an additional eighty men, and that so far as they are concerned the strike was at an end, as they had now as many masons as they have work for. The strike has lasted for fourteen weeks.

Blackpool Plasterers.—A compromise between the masters and employees has obviated a strike in the plastering trade. A month ago the employers gave notice of a reduction of a penny per hour in the rate of wages to be paid, thus bringing the standard down to 9d. Notice expired at the end of last month, and at a meeting of the two parties concerned the employees consented to accept a reduction of a halfpenny per hour. This was eventually agreed to by the employers.

The Bradford Dispute.—The Bradford Master-Builders' Association have had under consideration an offer from representatives of the masons now unemployed in consequence of the building trade dispute to recommend the men to resume work at ½d. per hour reduction, on condition that the masters did not insist on the rule that union and non-union men should work together. A reply was decided upon that the masters insist on non-union men and union men should work together, but they would permit any peaceful persuasion to be used by the men to induce the former to join the union.

Bricks and Mortar.

APHORISM FOR THE WEEK.

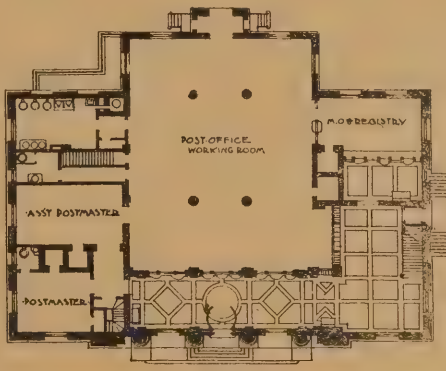
"*Work! Those who talk most know least.*"—
The late JAMES BROOKS.

Our Plates. THE post-office at Joliet, Illin., U.S.A., is an admirable piece of Classic work. Mr. James Knox Taylor, the supervising architect of the United States Treasury Department, has proved an exception to the general rule that nothing good in the shape of architecture can come from a Government department. We could wish that the same could be said of our own post-offices. The architects of the United States are producing much good work at present, due to the very complete training which students undergo at the several excellent schools (modelled on French lines) established in that country. Mr. Taylor in this post-office has wisely not attempted anything very original or brilliant, concerning himself chiefly with eliminating anything wanting in taste, and in consequence he has produced a most creditable and fine building. The planning is ornamental and workable, and strongly contrasts with what we are familiar with in this country.—The scheme for a Suffolk garden, by Messrs. Thomas H. Mawson, Dan Gibson and C. E. Mallows, explains itself.—Gordon House, Foley Street, W., consists of two flats on each floor, containing sitting-room, bedroom, kitchen, coal store, larder and w.c. The exterior is of picked stocks and red-brick facing, Portland stone and green coloured cement. Messrs. John Anley & Son, of Dalston, were the general contractors, and the sanitary works were carried out by Messrs. Thomas J. Boulting & Sons, of Union Street Middlesex Hospital. The architects are Messrs. H. Fuller Clark and Percy A. Boulting, of John Street, Bedford Row, London, W.C.

Cherbourg Stone. THE British Consul at Cherbourg states that there are several firms engaged in stone-quarrying there, all of whom appear to be doing well and show an ever-increasing business. The stone derived from the Cherbourg quarries is principally adopted for use as road metal; the stone is broken by hand, and is shipped mostly in British vessels to ports in the South of England, such as Poole, Shoreham, Southampton, Newhaven, Dover, Ramsgate, Margate, Herne Bay, Rochester, Stroud and the Thames. The stone shipped to these ports is termed screened, the stone being broken into pieces ranging from 1½in. to 2½in. in size. A slight misconception of terms should here be noticed, namely, that what is usually termed granite in England is at Cherbourg known under the name of quartzite, and it differs from the granite proper as found in the neighbourhood of Fermanville and Dielette in being much softer. A somewhat cheaper kind of stone is shipped to Llanelly and Bridgwater. The main trade is, however, in screened stone, and this export has shown a large increase during the last few years. The Cherbourg Quartzite Co., Ltd., shipped 34,000 tons, the Kent Road Maintenance Co. 55,483 tons, and other firms about 2,885 tons.

The Sutton Model Dwellings. THE trustees of the Sutton model dwellings scheme are looking for sites. Hitherto they have confined their quest to London, but their charter—the will of the late W. R. Sutton, carrier, of the City—permits them to buy land, which must be freehold or copyhold, in any populous place in England. Mr. Sutton left property worth more than £2,000,000. It yields about £80,000 a year, of which £13,000 is paid in the form of annuities to the testator's wife, brother (each of whom has an annuity of £5,000), sisters, nephew and some old friends and servants. The balance, and ultimately the whole, of the income is to be perpetually devoted to the erection and maintenance of dwellings for the poor. Perhaps its most remarkable feature is the provision that the dwellings must be let "below the full rents which could be obtained for the same." The trustees are told in the will that they may make the rents as low as they like, provided no person lives in a Sutton dwelling free of charge. Some months have passed since the death of the founder of the scheme, and people who knew of the will have been privately asking why there was no sign of preparations for the Sutton model dwellings. The reason is that three of the relatives of the deceased gentleman brought an action some time ago to set aside the testament as contrary to the Mortmain Act. Mr. Justice Buckley decided against them, and the scheme is safe, but it is not long since he did so. When the trustees have found a suitable site they will begin to build without delay, but all they do must be sanctioned by the Attorney-General.

The Ruin of Scottish Monuments. THE Glasgow Architectural Association held its first meeting of the session last week, when Mr. Charles E. Whitelaw delivered his opening address. The office-bearers for the session are: President, Mr. Charles E. Whitelaw; vice-presidents, Mr. William J. Blain and Mr. James Lochhead; hon. secretaries, Mr. Alexander N. Malcolm and Mr. William J. Lukeman; hon. treasurer, Mr. William Haldane; and hon. librarian, Mr. D. Bennet Dobson. After making a few remarks on the work of the Association during the past session, Mr. Whitelaw said that instead of, as customary, giving a paper of a general nature, he had chosen as a subject "The Disintegration of the National Ecclesiastical Monuments of Scotland." The lecturer divided his subject into three sections—first, the English Raids; secondly, the Religious Revolution; thirdly, the Period of Decay. Commencing with the period preceding the Reformation, the speaker referred to Henry the Eighth's failure to bring his nephew James V. of Scotland over from the Church of Rome, and to his starting a series of border raids covering from 1542–7, during which disastrous period all the border monasteries, with Holyrood Abbey and a great number of lesser ecclesiastical buildings, shared in the general destruction. He then referred to the Reformation in Scotland in 1543, during which many monasteries were pillaged, particularly those of Dundee, Perth and Aberdeen. Reliable information about this period was very scanty, but we could infer that the buildings themselves were not destroyed but, with the cathedrals, merely purged of the altars and offending images. The famous singing dome of St. Andrew's only existed in the imagination of a posthumous writer, the real cause being neglect and faulty construction. Mr. Whitelaw then spoke of the establishment of Protestantism in 1561. Scotland was very poor, never having recovered from the effects of the long-continued wars with England, hence we found the great churches, unable to maintain themselves, falling into partial ruin. The period of destruction and decay dated from the fifteenth century, when the vacant monasteries were pulled down by enterprising town officials to build tolbooths, &c.; by country lairds, to build mansions; and by farmers, to build steadings and dykes—a practice only checked during the Gothic revival in the first half of the nineteenth century.



PLAN OF UNITED STATES POST-OFFICE AT JOLIET, ILLINOIS. JAMES KNOX TAYLOR, SUPERVISING ARCHITECT.

MANCHESTER SOCIETY OF ARCHITECTS.

MR. ALFRED DARBYSHIRE'S ADDRESS.

THE opening meeting of the new session of the Manchester Society of Architects was held on Thursday evening last, Mr. Alfred Darbyshire (president) occupying the chair. In the course of his address the president said there might be present persons who, like himself, were fully aware of the conditions and who had not forgotten the difficulties which presented themselves to the man who elected to become an architect forty or fifty years ago. The student and the architect of the present day could have no knowledge of the state of the profession which existed in a provincial town like Manchester, and he offered his congratulations to those who were fortunate enough to have embraced the profession within the last quarter of a century. At the period of which he was speaking, the men practising architecture in Manchester were few in number and, he thought, all of them under the Classic influence. As a matter of course they were busy men, and could devote little attention to the education of their pupils. A time arrived, however, when that limited means of study ceased. The school of design became the school of art, the Academy of Fine Arts was established; they eagerly embraced the chances which these institutions offered, and which saved them from immolation on the altar of antiquity. In addition to these extra means of study, the Gothic revival set in and captivated them with its fascinating influence. They soon realised the fact that there was more in the development of architecture than could be got out of the "Five Orders," and that if their art was to rise to dignity and public appreciation it was to be by a cosmopolitan appreciation of the architecture of past ages and by collaboration with the sister arts of painting and sculpture. This was the condition of their art in this city about the middle of the Victorian era. Let them consider what had brought about the present state of prosperity, and the conditions under which it was now practised.

There appeared to him two marked and important causes for this change in architectural practice. The first of these causes was the determination on the part of architects to throw off the shackles of severe classicism. The second cause might be found in the increased opportunities for study outside the office walls. Schools of art arose, and the architect learned to become an artist. Public libraries were established, through which the student became a scholar, and, to crown all, a man arose who was to exhibit the beauties of Italian Renaissance in the streets of the city. Edward Walters struck the death-blow to the old school, which attempted to adapt Greek temples to town-halls, Quaker meeting-houses, concert-halls and infirmaries. He supposed there was scarcely to be found such an example in modern civic architecture where the whole character of a town had been so completely changed for the better by the genius of one man.

He went on to point out some of the defects in the practice of architecture of the present day. It was satisfactory to admit that improvement had taken place in recent years in the conduct of architectural competitions; but until competition was limited, each competitor remunerated, and the result adjudicated by a thoroughly competent and honourable architect, the system would remain incomplete and a scandal to our present state of civilisation. Although he entertained fixed and strong convictions on this matter, he would modify what he had said by this remark. If it were possible by the means he had mentioned to secure genuine and honest results, then any dormant talent might be developed and reputations made through the medium of competition. Genuine assessment was clearly the pivot on which such result was to be turned.

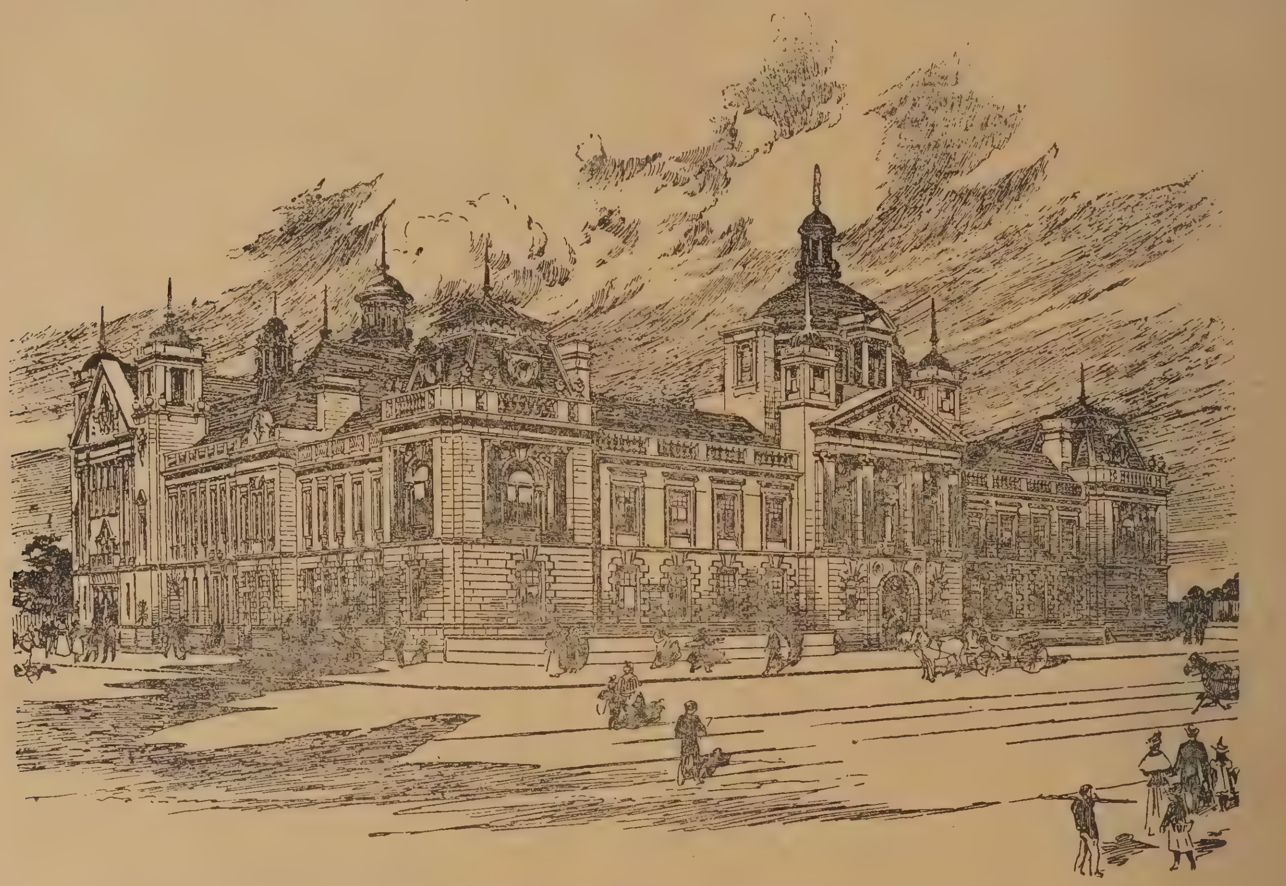
The members of this society were no doubt all cognizant of the fact that the Corporation of Manchester had determined to establish a municipal office of architecture, to be presided over by an official who was to be styled "The City Architect."

He fully appreciated the desire of the Corporation to appoint such an architect, and he would have him invested with power to condemn all ugliness and purely commercial street architecture; but it would be undesirable to place the future architecture of the city entirely in his hands. Such a decision would be the death blow to a variety of architectural treatment, and the future civic architecture would be "cribbed, cabined and confined" to one line of thought.

There was another matter which was of great importance to their local profession, and which required careful consideration. He alluded to the establishment of a Chair of Architecture at Owens College. The idea of a Professor of Architecture in connection with the University was not a new one. It had occupied the attention of some of the older members of the society for several years past, but it was only recently that the matter had assumed a practical form, and that steps had been taken towards the realization of an ideal, which he ventured to think would be of incalculable value to their profession in that city.

There was a point in connection with the practice of architecture to which he must briefly allude, and that was the collaboration of the architect, sculptor and painter where works were to be carried out in which an artistic ideal had to be realized, or where a symbolic decorative language had to be used on an architectural foundation. It had always seemed to him that although the architect provided the medium of artistic expression in his work, it was desirable that he should consult those who had to embellish it with high art adornment in sculptured or pictorial language—in other words, that proper preparation should be made for those sister arts which contribute so much towards the monumental character of architecture. He felt convinced that if a harmonious working together of the architect, sculptor and painter were made a rule instead of an exception, many mistakes would be obviated and grander results would be realized.

A New Evangelical Union Church at Glasgow is being erected at the corner of Dalmarnock Road and Harvie Street. It will provide accommodation for 605 persons, and is to be electrically lighted. Mr. J. C. M'Kellar, I.A., is the architect.



GOVAN MUNICIPAL BUILDINGS. THOMSON AND SANDILANDS, ARCHITECTS.

IS A NATIONAL IRISH ARCHITECTURE POSSIBLE?

THIS was the thesis of Mr. Charles MacCarthy's presidential address at the Architectural Association of Ireland last week. He was hopeful that the question could, and would, be answered in the affirmative. It was quite true that the present was an age most unfavourable to artistic development. Still, in spite of materialism the century just closed was not, even in the most material of countries, wholly unfavourable to other arts such as poetry and music. If such arts as these had been able to withstand the blighting influence of a philistine environment, why should they despair of architecture? Architecture, compared with some other arts, was, in some kind, a practical necessity.

Granted that a school of architecture was possible and necessary, it might still be asked, would not the attempt to make it national end in making it narrow and provincial? Was not all great art cosmopolitan? To the first of these questions the answer was an unqualified no; to the second a very qualified yes. Nationality and provincialism were as far asunder as the poles. As to cosmopolitanism in art, there too a confusion of thought existed. All great art must in its origin, its growth, its making, be instinct with the spirit of the country which had produced it, and, therefore, in the true meaning of the word, national. But there was a sense in which great art was cosmopolitan, for as soon as any nation had produced even one solitary work of really great art, that work belonged henceforth to mankind.

If he were asked to what branch of architecture he looked as holding forth the greatest promise of becoming the foundation of an Irish school, he would unhesitatingly say—to ecclesiastical architecture. It was to the Catholic Church, the church of the majority of Ireland, rather than to the State, the municipality or to private enterprise, that they must look for the material out of which a school of national architecture was to be created. But they could not conceal from themselves that church architecture in Ireland had fallen upon evil days. However much they might be disposed to blame the leaders of the Gothic revival in Ireland for having, under the influence of Pugin, adopted the English parish church as their model, instead of seeking inspiration from such beautiful examples of purely Irish work as were found in Cashel, Holy Cross, Cong and Kilkenny, still they must admit that they at all events were earnest men, and that their works were remarkable for beauty of design, honesty of intention and sound construction. Could they say as much of their church architecture of to-day? Was it not, on the contrary, too often characterised by the absence of every one of these qualities? Intricate in design, yet absolutely without interest, the majority of modern Catholic churches were nothing short of a disgrace to the country. Flimsy in construction, ill considered in plan and arrangement, made ridiculous by ill-placed senseless carving and pretentious but absolutely inartistic detail, these churches had been decorated internally in a manner of which literally he could not trust himself to speak.

Yet he did not despair. On the contrary he was filled with hope, because he believed that the lowest depth had now been reached and that when things had come to this pass they usually mend. But he had another and a brighter reason for hope. They must not forget that Ireland had a sound tradition of fine architecture, distinctively and peculiarly Irish; while in the decorative arts such as stone-carving and metalwork their pre-eminence in the past was almost universally admitted. He knew that it had been said that outside the early Romanesque work there was little or nothing distinctively Irish in their architecture, and that the Gothic work of, say, the thirteenth, fourteenth and fifteenth centuries was largely English. That was, however, an erroneous opinion, as was pointed out by Mr. James Ferguson. All the Gothic work in Ireland was, in fact, marked by what Mr. Ferguson called a foreign (that was, an un-English) character; while the cloisters of Muckross, Holycross and Kilconnell were, he said, more like those to be found in Sicily or Spain than anything in the British Islands.

Turning now to the present, he thought he could see the beginning of an art revival in Ireland. There was a movement around them which was national in the widest sense, a movement which had already given them that most astonishing revival of the Irish language, and a revival less marked, but very real all the same of music and literature. That this was certain to affect the artistic life of the country he for one could not doubt. If he were reminded that all this was largely a question of money, and that one could not afford to employ artists to paint the walls and windows or carve the capitals and string-courses of every country church, the answer was that half the country churches would be very much better without either carving or painting. If in future they left out the Carrara marble altar, with its bristling reredos, the vulgar stained-glass from Germany, and that impertinent carved oak pulpit from Belgium, and put the money into honest masonry instead, it would have cost them nothing, and they would have done a good stroke of work for architecture and for Ireland. It was to their architectural design that they should have to devote their attention in the first instance, if they honestly desired better things. As a first step on their road they must break with the evil practices of to-day, and then turning to the past of their own country for inspiration, let them study in the first place at least the simplicity and dignity so characteristic of their earlier Gothic buildings. Thus and thus only, he thought, could they hope to lay the foundation of a really national architecture.

At the above meeting the prizes won during the past session were distributed by the president, the prize-winners being as follows:—A.A I. travelling studentship, J. A. Rockett; Institute prize, Charles B. Powell; Beckett prize, L. O'Callaghan; class of design, 1st, W. Connolly; 2nd, J. K. Vinycomb and H. J. Leask (equal); class of building construction, 1st, H. Lundy, 2nd, W. Connolly; technical demonstrations, 1st, L. O'Callaghan; 2nd, H. J. O'Rourke; 3rd, F. Morley.

GOVAN MUNICIPAL BUILDINGS.

THE new town halls and municipal buildings erected at a cost of £48,000 by the Town Council of Govan were formerly opened last week. The site occupies a complete square; it is bounded on the north by Merryland Street, on the east by Govan Road, on the south by Summertown Road and on the west by Carmichael Street. The town hall extends along the entire west side of the block, the principal entrance to which is from Summertown Road by a three-arch doorway, leading through glass doors to the vestibule. There are two large corridors running parallel to each other along each side of the hall, which is entered from three different places. It is 90ft. long by about 60ft. wide, with an elliptical platform extending 14ft. into a recess at the north end. Immediately behind the platform Messrs. Norman & Beard, of Norwich, have built a four-manual organ, which will be worked by means of a 3 h.p. and 1 h.p. electric motor respectively. In the area there will be sitting accommodation for over 1,300 persons; while the gallery, which is reached by means of two main staircases leading from the vestibule, will seat over 1,000 persons. There are plenty of ante-rooms and lavatory accommodation, with specially-constructed ladies and gentlemen's cloakrooms; while a ladies' waiting-room and gentlemen's smoking-room are situated on the mezzanine floor. At the north end of the hall, and situated immediately to the rear of the platform, a suite of rooms have been set aside for the use of artistes taking part in concerts and other entertainments, access to which is gained by a separate door leading into Merryland Street. In addition to the main entrance there are two exit doors leading direct from the area of the hall to Carmichael Street. The lesser hall, which is situated above the borough treasurer's office, is entered from Summertown Road, and accommodates over 500 persons. There are also the usual ante-rooms and lavatory accommodation. In the sunk area there is a kitchen and scullery, with all the most modern appliances for cooking, &c., and from which easy access is gained to both halls. The eastern half of the block has been set aside for borough purposes, and offices have been provided for the town clerk, the sanitary inspector, the borough surveyor, the medical officer of health, and the inspector of weights and measures; while the council chambers are located immediately to the rear.

The architects of the buildings were Messrs. Thomson & Sandilands, of Glasgow; Messrs. Dansken & Purdie, of Glasgow, were the measurers; and Mr. Andrew Brown acted as clerk of works. The following were the contractors: Digger, mason, brick, steel and iron works, Thaw & Campbell, Glasgow; carpenter, joiner, glazier and ironmonger works, George Ferguson & Sons, Glasgow; slaters, James Cuthbertson & Son, Glasgow; plumber, John McFeat, Govan; plaster work, George Nicol & Son, Govan; carver work, James C. Young, Glasgow; sculpture work, A. McFarlane Shannan, Glasgow; heating and ventilating, James Boyd & Sons, Paisley; tile work, John Youden & Co., Ltd., Glasgow; grates and hearths, John Caird Parker, Glasgow; painter, John Hendry, Govan; electric lighting, R. D. Cassells & Co., Glasgow; mosaic and terrazzo floors, British and Italian Mosaic Co., Ltd., Glasgow; furniture, Wylie & Lochhead, R. Balfour & Son, and A. Gardner & Son, all of Glasgow; forms and chairs, Robertson's Furniture, Ltd., Glasgow; basement lighting, St. Pancras Ironwork Co.; electric motors and fittings for organ-gearing, King & Co., Leith; organ case, John Craig, Glasgow; ornamental iron gates and railings Singer & Co., Frome; stair railings and grills, George Adam & Son, Glasgow; and railings for town hall, T. & R. Adam, Govan.

We are enabled to publish the accompanying block through the courtesy of the "Glasgow Evening News."

Builders' Notes.

Granting Building Certificates.—At a meeting of the Accrington Town Council exception was taken by a member to a decision of the General Works Committee that certificates of completion of houses be not given unless they are finished in all respects in accordance with deposited plans, and where same have garden areas in front, unless the garden area walls and railings and garden threshold are fixed and finished off. He contended that the building by-laws were hard enough in Accrington already without imposing such a stringent restriction as this, and moved that the minute be referred back. The town clerk pointed out that in some cases garden walls and areas had not been completed for a considerable time after the houses themselves were finished, and people who had purchased houses had complained that they could not get them completed in accordance with the deposited plans. The amendment was lost.

Slump in the North Lincolnshire Brick Trade.—The men in the employ of Messrs. Turner Brothers, of Barrow Haven, recently received notice that operations would cease at the end of last week and the three yards belonging to the firm would be closed indefinitely. Owing to the slump in the brick trade very little manufacturing was done during the summer, and as a consequence there will be no necessity to dig clay during the ensuing winter. The direct effect of this state of affairs is that the men will probably flock to Hull in search of employment. Such a state of things has not occurred within the memory of the oldest inhabitant. Tile-making, a speciality of the firm up to a year or two ago, has entirely ceased, as well as the manufacture of ornamental finials and ridges. This is in a great part owing to the introduction of cheap foreign slates, mostly from Belgium. Another yard in the immediate vicinity has also practically ceased working, and the large stocks held by all the yards in the neighbourhood will have a disastrous effect upon the labourers during the winter. As before noted, this experience is unique at Barrow Haven, where up to the present year an accumulation of stock was unknown, the goods being readily bought as soon as manufactured. Although the dearness of material is no doubt partly responsible for the present state of things, another important feature must not be lost sight of, that during the last two or three years the output has been considerably increased by the establishment of new yards furnished with modern machinery. No fewer than eight new yards have been started between Barton and Grimsby during the last two years. This over-speculation was caused by the high price of bricks at the time, and the expectation of extensive buildings at Hull and Grimsby.

Engineering Notes.

A New Bridge over the Darwen has been erected at Walton.

Mr. E. Cruttwell, M.Inst.C.E., who, in conjunction with Mr. A. Murray, is carrying out the widening of London Bridge, has recently entered into partnership with the firm of Sir John Wolfe Barry & Partners, of 21, Delahay Street, Westminster.

A New Bridge over the Ythan at Auchedly is being erected. It is built on the site of the old Auchedly ford. The bridge will be a substantial stone structure, built after plans prepared by Mr. William Davidson, architect, the road surveyor of the district. Mr. Edgar Gauld, of Aberdeen, conducted the building operations, under the superintendence of Mr. Adam Scroggie.

The Main Section of the Croydon Electric Tramway, extending from Norbury to the borough boundary, was opened recently. The work, which it is estimated will cost altogether about £250,000, has been carried out by the Croydon Corporation in conjunction with the Callender Cable Co. The engines and cars have been supplied by the British Thompson Co., and the line has been leased by the Corporation to the British Electric Traction Co. for a period of twenty-five years, terminable every five years, the company paying 6½ per cent. interest on all capital outlay.

A New Bascule Bridge at Hull is being erected across the river Hull at Scott Street. It is expected to be in working order some time next year. The abutments and approaches are now being proceeded with. The bridge itself will be built of iron and steel. Crossing the river midway between North Bridge and Sculcoates Bridge, it is situated between Scott Street, Wincolmlee, on the west side, and Lime Street, Jenning Street and St. Mark Street on the east. It will be the means of bringing the east district in more direct communication with the Cannon Street Station of the Hull and Barnsley Railway, the north-west part of the city, and the numerous timber-yards, oil, flour and paint mills and works situate on the river-banks. The cost of the bridge, including the property acquired for the approaches, will be about £30,000. In connection with it is a subway for water, gas and electric mains. The Corporation have also obtained power by their Act of 1901 to construct a bridge across the river at Stoneferry, which will prove another means of communication between east and west, and will bring the number of bridges across the river up to six, five of which will be under municipal control.

THE FIRE AT STEPNEY CHURCH.

ON Saturday morning last a serious fire occurred at the ancient parish church of St. Dunstan, Stepney, a considerable part of the building being destroyed. About six o'clock the east end of the building was seen to be in flames, and though these were got under by eight o'clock the whole roof of the nave had been destroyed, only the skeleton of charred rafters remaining, stripped of its tile covering. The fire seems to have begun in the heating cellar, and thence to have run up the steps of the organ loft to the organ, which was completely destroyed. The débris of the organ falling on the altar, that was also burned, and the vestries were gutted. The roofs of the aisles, except about 5ft. at the organ end, are intact; the walls, floor, and seats of the church are practically uninjured; and the square tower at the west end, with its clock and bells, has not been touched. The great east window was much injured, and one other stained-glass window destroyed, but the parish registers, going back to 1568, and the silver-gilt church plate, of seventeenth-century work, having been kept in a large safe, have been preserved uninjured.

In 1485 the church was rebuilt, the fine old oak roof now destroyed dating from that time. The only parts of the present church which date back to before that rebuilding are the sedilia and an old stone crucifix, but these probably were not made earlier than the twelfth century.

The church was restored two years ago at a cost of £5,500. It contains many interesting monuments which have, fortunately, not been destroyed by the fire.

Keystones.

New Offices for the Felling Urban Council are proposed to be erected at a cost of about £8,000.

New Buildings at the West of England Eye Infirmary, Magdalen Street, Exeter, have been erected. They are built of bricks with Bath stone dressings. The cost is estimated at £18,000. They provide for fifty in-patients.

A New Town Hall at Alfreton has been opened. Mr. Frederick Lee, of Alfreton, was the builder. The building includes a county-court room and post-office. It is built of red bricks with stone facings. The hall has a seating capacity of 600.

Photography at Tintern Abbey Permissible.—We learn on the highest authority that the statement recently made that photographing at Tintern Abbey would not be allowed in future is absolutely without foundation.

A New Mission Church at Leeds has been erected in Pennington Street, Woodhouse Ridge. The building, which is named after St. Gabriel and will seat 360 persons, has been erected from the designs of Mr. G. W. Atkinson, at a cost of £1,450, exclusive of furnishing and site.

A New Church at Edmonton, to be dedicated to St. Michael, is being erected. The total cost of the building, which will occupy a prominent site adjoining the Mission Hall, within half a mile from Lower Edmonton Station on the Great Eastern Railway, is estimated at £12,000. Mr. W. G. Cave is the architect.

The New Buildings in connection with the Hounslow Polytechnic were opened recently. The extension was built by Messrs. George Challis & Co., of Brentford, from the designs of Mr. H. T Wakelin, county engineer and surveyor, at a cost of about £2,000. It comprises a new art-room 37ft. by 31ft., and accommodation for carpenters, plumbers and bricklayers' shops.

A Consumption Hospital Competition.—The committee of management of the North London Hospital for Consumption having asked five well-known hospital architects to compete for the erection of their proposed country branch and convalescent home at Northwood, Middlesex, have selected the design submitted by Mr. Frederick Wheeler, F.R.I.B.A., of 6, Staple Inn, W.C.

A New Temperance Hall at Birmingham has been erected near the top of Temple Street, and was formally opened by Mr. Chamberlain last Monday. The new structure is free Renaissance in style. It has been built of pressed red bricks with buff terra-cotta dressings. The gallery is similar to the dress circle in a theatre. It is so constructed that every person seated therein—and it can hold 450—can see the platform. The area of the hall can accommodate 550 persons. Messrs. Ewen, Harper & Co. were the architects.

The New Melville United Free Church, Aberdeen, is being erected on a corner site on the south side of Skene Street at its junction with Rose Street. The frontage to Skene Street is 68ft. and to Rose Street 160ft. The design is Classic. The architects are Messrs. Brown & Watt. The feature of the building is a campanile, rising to a height of 120ft. at the corner. The seating is arranged in horse-shoe form. The pulpit is placed at the west end of the church. There are narrow galleries at the two sides and a larger one opposite the pulpit. The interior walls of the area up to the gallery level will be panelled in woodwork throughout. The large hall extends along Rose Street and gives seating accommodation for about 400 persons, where it is intended to carry on the Sabbath school work. There is a small hall which will hold about 100 people, adjoining the larger hall, and the two can be thrown into one. The session-house will seat about forty. The two street elevations and the campanile are to be built of white Kemnay granite, having the dressed and moulded features close-picked and the plain wall surface faced with hammer-blocked Ashlar. The total cost of the buildings will be over £7,000. The contractors are as follow: Masonwork, Messrs. Pringle & Slessor; carpenterwork, Mr. Alex. Hall; slaterwork, Mr. George Farquhar; plasterwork, Messrs. Roger & Baxter; plumberwork, Mr. James Monro; painterwork, Mr. Edward Copland; heating engineers, Messrs. Shirras, Laing & Co.

A New Board School at Catford have been open in Holbeach Road. It provides accommodation for 314 boys, 314 girls and 318 infants.

Why every Architect and Builder should buy "Specification No. 5" is clearly explained in a brochure which has just been issued. It can be obtained from the publishers, 1, Arundel Street, Strand, post free.

A New Board School in Whitechapel was opened in Commercial Street last week. The new buildings will accommodate 900 children, and are lighted by electricity drawn from the Stepney borough mains.

A New Opera House at Tunbridge Wells is being erected at a cost of £30,000. It will have a seating capacity of 1,200. Mr. J. P. Briggs, of Effingham House, Arundel Street, Strand, W.C., is the architect.

Mr. H. Ascough Chapman, A.R.I.B.A., architect, of Leeds and Scarborough, has been appointed architect for the new group of buildings to be erected by the Leeds Corporation in Ashley Road, comprising a police and fire station, inspector's residence, single men's quarters, &c.

The Alfred Miller Institute, at Barnstaple, was opened last week. It has cost over £3,000 for building alone, and the total expenditure is over £5,000. There are large recreation- and reading-rooms for men and women. A concert hall affords accommodation for 300 persons. At the western end of the building is a clock tower.

A Sale of Furniture is now being held at the establishment of Messrs. Oetzmann & Co., of 62–79, Hampstead Road, W. They are offering a stock of furniture, china, glass, &c., together with carpets, rugs, curtains, &c., at a discount of 47½ per cent. for cash. A special illustrated catalogue is published in connection with the sale.

A New Church Hall has been erected in connection with Penicuik North United Free Church to accommodate about 200 persons. The hall, which was designed by Mr. R. Murray, George Street, Edinburgh, is of a style of architecture which harmonises with the church which it adjoins. The contractors were as follow: Masonwork, Mr. C. Lawson; joinerwork, Mr. James Tait; plumbing, Mr. T. Brown; slating, Mr. R. Dickson; painting, Mr. C. Wilson; heating, Messrs. Meikle & Philp, Edinburgh. The furnishings were supplied by the Bennet Furnishing Co., Glasgow.

A New Church of England Infant School has been erected at Newcastle-on-Tyne, in connection with the parish of Byker St. Anthony. The building is of red bricks with stone dressings, and is to be 73ft. long and 53ft. broad. There is a large schoolroom, which can be made into two by a movable partition, and a special classroom for cooking fitted up with gas stove and range. The school will accommodate about 200 children, and will be enclosed with a boundary wall and railing. The architect is Mr. J. Wightman Douglas, of Alnwick, and the contractor Mr. W. S. Anderson, Hunter's Road, Newcastle.

The Church of St. Botolph, Stow Longa, Hunts., dating from Norman times and containing work of all the succeeding centuries, was reopened recently, after rebuilding of the clearstory and nave and aisle roofs from designs by Messrs. John & S. Inskip Ladds, joint architects, of 7, Doughty Street, W.C. The new clearstory is based upon the fragments of the former one which were found during a previous restoration. It is of Early Perpendicular character and has been erected of Weldon stone by Mr. Henry Ashley, of St. Neots. The new roofs are of English oak, and have been executed by Messrs. Wrycroft & Sons, of St. Neots; that to the nave is of hammer-beam construction, and into the three middle principals the old tie beams of the late roof (which was of debased seventeenth-century character) have been framed. The roofs of the aisles are quite plain except at the eastern end of the south aisle, where a side chapel has an ornamental ceiling. The nave is covered with tiles, but the aisles with lead laid by Messrs. Peacock & Sons, of Huntingdon. A new wood block floor has been laid by Messrs. Goddard & Sons, of Farnham, Surrey; the glass is by Messrs. Pepper & Sons, of London, and the new side altar by Mr. Reid. The work has cost £1,150.

A New Suite of Halls and a Rectory for St. Mary Magdalene's Episcopal Church, Dundee, have been erected at a cost of £9,000, inclusive of the cost of the site.

The Advertisements on Dover Cliffs, against which for several years there has been carried on a strong public campaign locally and throughout the country, were removed last week. One of these signs alone contained no less than 4 tons of timber.

The Royal Albert Asylum, Lancaster, has been extended at a cost of £15,000. Special provision is made by the extension for epileptics, cripples and feeble patients, whose removal from the main block will enable the number of patients to be increased to about 800.

The Old County Hall in Spring Gardens, S.W., has recently undergone a complete renovation. The London County Council Chamber and all the committee-rooms have been decorated afresh, and a new system of electric lighting has been introduced into the former. Several structural alterations have also been made in the building, and a new corridor constructed on the east of the council chamber.

A New Sunday School has been erected in connection with the Unthank Road Baptist Church, Norwich. The architect was Mr. A. F. Scott and the contractor Mr. S. R. Wilkins. The building consists of a central hall, with gallery, nine classrooms and a room for the superintendent, and it is connected with the church by a covered corridor. The total cost of the building has been £1,800.

A New Public Hall at Jedburgh has been erected in Abbey Place at a cost of £6,000, and besides the large hall and gallery, in which about 803 people can be accommodated, there are a small hall for meetings, a drill hall and armoury for Volunteers, ante-rooms, cloak-rooms and other places. The principal frontage is 90ft. in length. The style is an adaptation of the later Renaissance period. Mr. James P. Alison, of Hawick, was the architect.

A New Congregational Chapel at Brislington has been erected on the main road at the corner of Wick Lane. The work, which has been completed by Messrs. W. Cowlin & Son, is a part only of the design furnished by Mr. Frank Wills. The plans provide accommodation on the ground floor and galleries for 812 persons, and with large schoolrooms at the side would cost about £8,000. The present portion of the building adequate for seating 385 persons has cost about £4,000.

A New Reredos at St. Michael's Church, Edinburgh, has recently been erected in the Lady Chapel. It is in late Gothic style, showing traces of German influence, and is decorated with colour and gold. When complete the niches will contains groups of figures. The carving was carried out, from designs by Mr. Hamilton More Nisbett, architect, by Mr. John Gibson, Haymarket; and the painting and colour decoration were done by Messrs. G. & H. Potts, Edinburgh. The cost was £145.

Fletcher's History of Architecture.—Mr. B. T. Batsford will issue early in November a revised and enlarged edition of "A History of Architecture on the Comparative Method," by the late Professor Banister Fletcher and Mr. Banister F. Fletcher. This edition has been revised and considerably enlarged by the junior author, and includes the Saracenic and Eastern styles. It now has 256 full-page plates, one-half being from photographs of buildings, the other from specially-prepared drawings of constructive and ornamental detail, including over 1,300 illustrations.

Ruskin's Birthplace.—The lease of No. 54, Hunter Street, Brunswick Square—where Ruskin was born in 1819—which belongs to the Foundling Hospital, having expired, the house is being completely renovated; and in order to give it a modern look the sashes of the front windows, which were in small squares, have been taken out and have been replaced by coarsely-moulded ones, glazed with inferior sheet glass in large squares, completely altering the character of the front of the house. This alteration will probably be followed by the removal of the delicate lead fanlight and the iron railings in front (as has been done elsewhere), and the transformation will then be complete.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.

THE STANDARD TECHNICAL AUTHORITY.

"SPECIFICATION"

The Fifth Edition of this comprehensive work will be published in December next, and intending Subscribers are asked to send in their orders at once to the PUBLISHER.

The whole of the Fourth Edition has been sold out, and copies of No. 5 cannot be guaranteed unless orders are received in good time.

* * *

A PROFESSIONAL OPINION.

Mr. H. R. HARDING, Architect, of Leicester, writes under date October 10th, 1901:

> *"I consider the work should be in the office of every Architect, forming as it does, in its plan and scope, an invaluable source of reference in almost every point likely to be raised in ordinary architectural surveying practice.*
>
> *"I do not doubt, as you proceed with the publication it will become more generally known and receive the appreciation it fully deserves.*
>
> *"I have produced it in Court as an authority when giving evidence in building cases, and it has been accepted as one of the leading technical works of the day. I am looking forward with anticipation to the next volume."*

SUBSCRIPTION ORDER FORM.

To the Proprietors of "SPECIFICATION,"

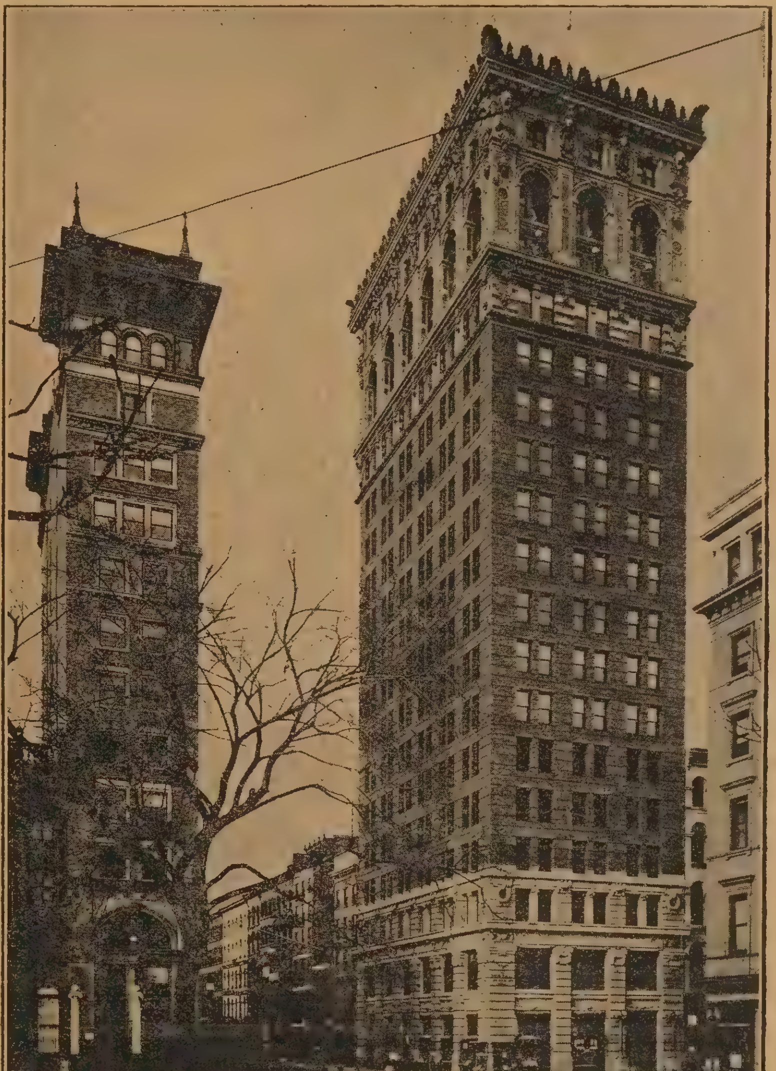
An Architectural Causerie.

Insecure Balconies. SOME time ago we took occasion to refer to the senseless practice of providing balconies which will never be used, or are so small that they can be put to no better purpose than holding flower-pots. Last week a more serious matter concerning balconies came before the Manchester City Coroner. On the occasion of Lord Roberts's visit to the city, a certain small balcony on the first floor of No. 66, Deansgate was occupied by three ladies, for whom the stonework was covered by some paper held down by weights. Whilst a clerk was removing the last of these weights, after the procession had passed, the stone capping of the balustrade slipped and fell into the street, killing a girl. There was nothing to hold the stone in position (though it certainly should have been dowelled), and it is surprising that it remained in place so long, for the balcony was built more than twenty-five years ago. At the inquest the coroner said that if the accident had happened within a short time of the fixing of the stone he would not have hesitated to advise the jury to commit the responsible person for trial on a charge of manslaughter: and he pointed out that owners of property frequently neglect to see whether balconies and similar parts are safe or unsafe. As the coroner very justly remarked, they should not be allowed to come into a court and say, "I did not know it was dangerous." If they had examined it they would have found it out. In this particular case a verdict of "Accidental Death" was returned, but the owners of the property are certainly morally culpable for neglecting to ascertain that the balcony was unsafe. The case should prove a warning to others.

Liverpool Cathedral. MR. REGINALD BLOMFIELD and Mr. Robert Gladstone have had a thorough tussle in regard to Liverpool Cathedral. The dispute about what the style should be is, however, of no particular consequence, though it forms instructive reading. It is the fact that "Gothic" should have been stipulated as the *only* style which draws down the outburst on the heads of the Executive Committee. And so long as there is any chance of getting such an unjust and unwise restriction altered, so long should every voice be raised in protest.

Something in the City. THERE was much righteous indignation at last Thursday's meeting of the Court of Common Council with regard to the constant upheaval of the streets, but we fear that little good will result from the resolution to the Streets Committee to consider the desirability of obtaining further Parliamentary powers. The Post Office and the water, gas, and electric light companies have turned the streets into such a chaos that on several occasions it has been much quicker to walk from the Strand to London Bridge rather than to venture on a 'bus or in a cab; yet, however zealously the Corporation exercise their powers under the Sewers Act of 1848, and even assuming that additional Parliamentary powers are obtained, it is not likely that any radical improvement will be effected; for it is subways that are needed, and until these are provided—though at a necessarily great initial expenditure—we shall always be harassed by the workmen who mark out little claims for themselves in the middle of Fleet Street, and leisurely dig and scrape to the accompaniment of a plethora of human abuse. Another interesting matter discussed at last Thursday's meeting was that concerning the safety of St. Paul's Cathedral. The facts about the disturbances caused by underground tunnelling have already been published in these columns, and they clearly prove that, though no serious subsidence has yet taken place, if the fabric is to remain secure there must be no more "tubes" in the immediate vicinity—the Central London Railway on the north is only 460ft. from the centre of the dome, yet the new line from Piccadilly proposes to come 160ft. nearer! The Dean and Chapter will do all they can by opposing the Bills; but is it not ironical that, while money is being wasted inside on foreign decorations, there are no funds available for structural works to assure the safety of the cathedral—not even enough to keep the building in thorough repair!



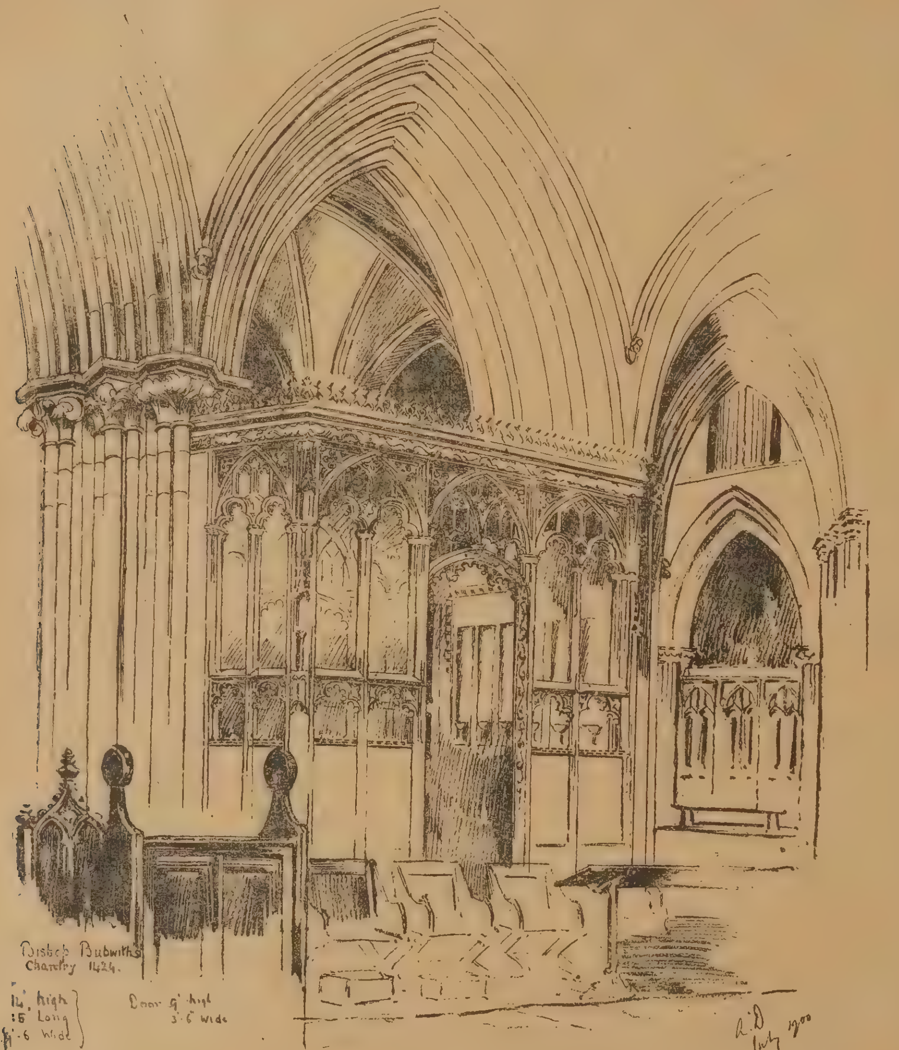
"BROADWAY CHAMBERS," BROADWAY AND CHAMBERS STREET, NEW YORK.
CASS GILBERT, ARCHITECT.

"Broadway Chambers," New York. THE problem of treating the tall building in a thoroughly satisfactory manner architecturally is probably insoluble, on account of the fundamental fault which exists in the proportion between height and width. As one of many admirable attempts made—such as that of Bruce Price with the American Surety Building—we would draw attention to the block of shops and offices illustrated on this page. Mr. Cass Gilbert has been particularly successful in his treatment of the windows, which, though repeated so exactly, are well proportioned to one another and to the whole structure. Moreover, the base, with its massive piers, gives a sense of adequate strength, which is maintained by the lines of the piers being carried up squarely to the top cornice; this latter, however, with its German stove ornamentation, is the worst part of the design—a squarely-treated cornice would have harmonised with the rest of the building, whereas the existing one is quite foreign to it. However much we may object to the system which demands such high buildings as this, architects have to meet the requirements; and when they are able to succeed so well as Mr. Cass Gilbert, they certainly deserve our praise. The building shown on the left of the illustration is the Shoe and Leather Bank Building, of which the architects were Messrs. Cady, Burg & See: the difference in the two treatments affords an interesting comparison, though it only enhances the superiority of the larger building.

SKETCHES AROUND WELLS.

By A. DURST, M.A.

THE church of St. Cuthbert, at Wells, was originally cruciform, with a central tower, but of the old church only a portion of the north transept remains as originally built. Early in the fifteenth century the great west tower was added, probably by Bishop Bubwith, who also built the north-west tower of the cathedral. The groined vault under the belfry is on the same lines as the Decorated vault in the cathedral. Later in the same century the whole of the nave was rebuilt in a somewhat unusual manner. The piers of the north and south arcades were raised, and the old Decorated arches re-used to carry the new Perpendicular clearstory above. The caps have also been carefully stripped of their foliage, leaving a smooth bell-shaped form beneath a wide-spreading abacus. The whole forms a most graceful and light arcade. The east walls of the north and south transepts were once rich with carved and coloured stone forming reredoses to the side altars of the church, but at the time of the Reformation these were broken, smoothed off and plastered over, after the manner of that period.



Besides St. Cuthbert's and the north-west cathedral tower, Bishop Bubwith built for himself a chantry (about 1424) in the ninth bay of the nave on the north side, which now corresponds to Sugar's chantry built about forty years later on the south side. Externally, the detail of this elegant little chapel is well preserved, but inside the carved niches and canopies on its east end have been hacked off flush with the wall. The doorways on the north and south were evidently, from the delicacy of their detail, never intended for doors or gates, the chantry being entirely open to the church.

Authorities differ as to which is the finest of the Somersetshire towers, but that at Chewton Mendip, at the foot of the north slope of the hills from which it takes its name, is certainly among the best. Though not so large as that of St. Cuthbert's, Wells, it is more graceful in outline and richer in its detail, and in its several parts typical of the many magnificent late Perpendicular towers of the county.

The Abbey Barn, Glastonbury, is the finest of several similar tithe barns in the neighbourhood. Its length, 93ft., is rather less than that at Wells, which is 110ft., but it far surpasses it in its proportions and the quality of the work. Though built for the most part during the Perpendicular period, there remain in its buttresses and some portions of the walling traces of an earlier building. The ornament concentrated on the gables takes the form of grotesques, symbolical of the purpose for which the barn was intended, and shows the religious spirit which animated the builders. The whole forms a splendid instance of architecture meeting the homely needs of the abbey in a practical and yet beautiful manner. One trembles to think of a twentieth-century Gothic barn!

In nearly all the villages round and about Wells many of the smaller domestic buildings have had much care bestowed upon their detail. In the once flourishing village of Croscombe, famous for its church full of carved oak, the house now known as "The First In and Last Out" inn is a picturesque example of late fifteenth-century work.

THE NEW "DRAINAGE BY-LAWS" OF THE LONDON COUNTY COUNCIL.

By G. A. ALLAN, late Sanitary Inspector, St. Martin-in-the-Fields.

UNDER the Metropolis Management Act 1855, the Metropolitan Board of Works had authority to make by-laws for regulating the drainage of buildings in the Metropolis, an authority they never exercised. The same Act required any person erecting a building to drain it to the satisfaction of the local authority or their surveyor. Under this section the several vestries and boards of works issued "drainage regulations." Summonses issued for breach of these regulations were dismissed on the ground that the local authorities had no power to issue regulations. Latterly they were only used as statements of the requirements as to drainage which would be necessary to complete the work "to the satisfaction of the local authority or their surveyor"; and when a summons was issued it was for improperly draining a building and not for breach of regulations.

The Public Health (London) Act, 1891, gave the London County Council authority to issue by-laws "with respect to water-closets . . . and the proper accessories thereof," which by-laws they issued in 1893. From 1893 until June, 1901, in the administrative county of London, the plumbing was regulated by the London County Council and the drainage by the various sanitary authorities. Plumbing was therefore uniform throughout London (outside the City); drainage varied with the idiosyncracies of the local bodies. And before summoning delinquents under the latter it was customary to ask what other authorities allowed.

In June last the London County Council, when issuing drainage by-laws, incidentally amended their by-laws as to plumbing, as explained in the BUILDERS' JOURNAL for October 2nd.

The drainage by-laws enact that no subsoil drain shall discharge directly into any sewer, but shall discharge into a trap; that the trap shall be connected to the sewer by a pipe laid and jointed as for sewage; that the inlet to the trap shall be ventilated to the open air, the opening to be protected by a grating the apertures in which shall equal the sectional area of the pipe. Drains for surface water are to be laid as for sewage, and to be fitted with properly-trapped gulleys. Except subsoil drains (which are not again referred to), all drains are to be of stoneware, iron or other suitable material. No drain shall be laid under a house except no other manner be practicable. No drain is to be less than 4in. diameter. All drains are to have a suitable fall. Except iron drains above ground which are supported at least at each joint by piers or other sufficient supports, constructed of iron, stone, brick or cement-concrete, all drains are to be laid on a bed of good concrete not less than 6in. thick, and projecting at each side of the drain at least equal to the external diameter of the drain.

Stoneware drains laid under buildings are to be covered with concrete at least 6in. thick; when not under buildings stoneware drains are to be embedded in concrete up to half their diameter, and of the full width of the concrete bed already specified.

Iron drains are to be jointed with molten lead, properly caulked. The depth of socket and width of lead space are given, but the quantity of lead to be used is not specified. Where practicable all drains under buildings are to be laid in straight lines, and where they pass under walls they are to be protected by means of an arch, flagstone or iron support. Means of access must be provided at each end of a drain passing under a building. The concrete to be used is to consist of 1 part cement, 2 parts sand, and 6 parts clean gravel, broken hard brick or other suitable ballast. All openings to drains, except for ventilations, are to be properly trapped. Dip traps, bell traps and D traps are prohibited. Rainwater pipes and channels are to discharge in the open air over a gulley or into a gulley above the water level; they are not to be constructed so as to receive solid or liquid matter from any water-closet, urinal, slop or other sink or lavatory. Every drain to be efficiently trapped as near as practicable to the sewer. A manhole is to be

provided for access to the trap. Except where the trap is fixed close to the building, a drain which is under a building will require at least three manholes. The manholes are to be made watertight up to the ground level, and to have suitable manhole covers fitted. If the manhole be within the building the cover must be air-tight. No right-angled junctions are to be used on drain or soil pipes.

Every drain shall be ventilated either by an inlet near the ground near the trap and an up-cast shaft at the highest part of the drain, or by an up-cast shaft near the trap and an inlet near the ground at the highest part of the drain, or by two high shafts which shall act indifferently as inlet or outlet, according to the direction of the wind or the flow of sewage in the pipes. All ventilating pipes are to be of 4in. diameter, except that 4in. drains may be ventilated by a soil pipe of 3½in. diameter. All waste-water pipes are to discharge in the open air over, in or near a trapped gulley.

There is no requirement in the by-laws for a separate drain for each house. I have seen, in London, two fairly large houses drained through one 4in. intercepting trap. It is not necessary to protect iron drain-pipes with any rust-preventing solution or process, though there is no doubt that Dr. Angus Smith's treatment makes the insides of the pipes much smoother and protects the iron very thoroughly. It is not necessary to provide and fix the mica flap on the inlet. This will grieve no one but the manufacturers of the mica flaps, and those who like their appearance. Section 8, paragraph (v.), requiring every pipe or shaft used in connection with the ventilation arrangements to be constructed in the same manner and of the same material and weight as if such pipe or shaft were a soil pipe, is obviously a mistake: or the connection from the manhole to the inlet may be of lead, though it would necessarily be underground. A lead pipe underground in a garden is not so good as stoneware and concrete. It will also be impossible to provide gulleys in the open air for the waste pipes to discharge over in connection with some buildings in London, unless the gulleys are fixed in the street. It is also to be regretted that it was not made compulsory to deposit plans of the proposed construction or reconstruction of drains.

Law Cases.

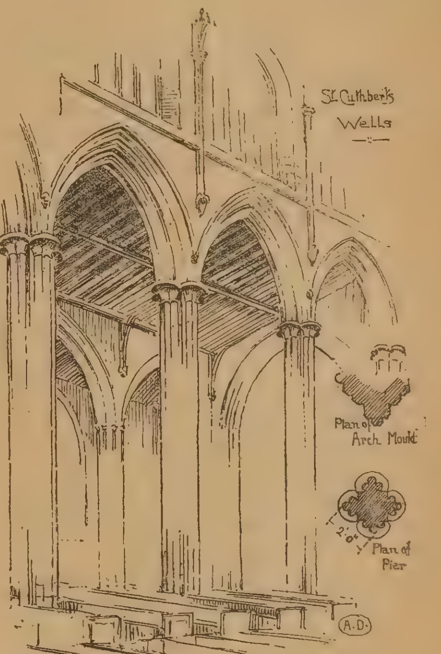
The Builder of Kumasi Fort.—Mr. W. Cheasley, a civil engineer, who went out to West Africa with the late Prince Henry of Battenberg and Sir William Maxwell in the Government service, and built Kumasi Fort, appeared at Southwark County Court recently on a judgment summons for a debt of £10 10s. 11d. due to Messrs. E. & H. Measures, of Bermondsey. The debtor said that he saved £700 at Kumasi, and on returning to Dartford he was induced by a landowner to build houses there. He got into debt and was sent to Maidstone Gaol. A month ago the "land shark" took five of his houses, worth £1,300, for £619 which he owed, and followed it up by obtaining an eviction order against him, his wife and two children. The judge made an order for 5s. per week.

Re C. G. Crowden.—An adjourned first meeting of creditors was recently held under this failure, the debtor being described as of Westbourne Bridge Wharf, Paddington, builder and contractor. A statement of affairs was now filed, showing a total indebtedness amounting to £48,475 7s. 3d., of which £4,852 5s. was returned as expected to rank for dividend, and assets, consisting chiefly of a surplus from securities held by creditors, estimated at £13,790 15s. 4d. The debtor, since 1899, had carried on business as a speculative builder, and had been engaged in building operations at Edgware, Kilburn and Little Ealing Lane. The failure was attributed to the debtor's inability to let certain premises, to law costs, and to interest on borrowed money. There was a further adjournment for three weeks to enable creditors to consider a proposal.

Re J. J. Weibking.—In the London Bankruptcy Court last week this debtor, a builder and contractor, of Southgate Road, N., applied to pass his public examination upon accounts showing gross liabilities £49,907 (£14,468 unsecured), and assets £7,322. The debtor stated, in examination by Mr. C. A. Pope, assistant receiver, that, starting business in a small way in 1872, he in 1881 compounded with his creditors and paid them 5s. in the £, afterwards continuing his business, which was that of contracting to buy old houses, pulling them down and rebuilding them for sale. He afterwards entered into building agreements for the erection of houses at Hoxton, Kingsland and elsewhere. He also erected the Wood Green Cycle Track. He attributed his failure to overbuilding, to payment of excessive interest on borrowed money, and to his inability to realize his property. He did not think he had lost much by betting. The examination was concluded.

Boxroom or Bedroom.—At the Ayr Dean of Guild Court on October 11th, Mr. D. Hill, insurance agent, applied for warrant to erect six houses in Fotheringham Road. The surveyor (Mr. John Young) took exception to a room designated on the plans a boxroom, on the ground that it did not comply in the matter of height with the building regulations, being only 6ft. 6in. instead of the 8ft. required for a habitable room. The applicant stated that the room was not intended to be used as a bedroom, but the surveyor pointed out that it had a fireplace and might be so used. The dean moved that the warrant be refused. Bailie Tait thought the surveyor was stretching a point in calling this a habitable room, and moved that the plans be passed. Bailie Morton seconded, and on a division the amendment was carried by five votes to three. The dean thereupon refused to sign the warrant.

Injury to an Adjoining House caused by New Building.—The case of *Holden* v. *Burton* was recently heard at the Blackpool County Court. The plaintiff claimed £50 for damages alleged to have been caused to his house in Princess Street by the defendant building a house against it. The judge, after reviewing the facts of the case, said he found there had been some slight increase of existing dislocations of the plaintiff's house, but he also found that there had been no negligence in the building of the defendant's house, for practically on the surface was the best way to build it to avoid the plaintiff's house subsiding. The damage was not caused by excavations or direct disturbance of the soil, but by the weight of the defendant's building pressing and compressing the peaty soil underneath both houses. The question of law he had reserved was whether the damage caused by the mere placing of the weight of building without removal, temporary or permanently, of the soil affording support to the adjoining house was an actionable interference with the plaintiff's right to the support of the defendant's adjoining land for his land and house. He was of opinion that the decision in the case of *Dalton* v. *Angus* governed the present one. The first question submitted to the judges in this case and answered by all of them in the affirmative was, "Has the owner of an ancient house a right of action against the owners of lands adjoining if he disturbs his land so as to take away the lateral support previously afforded by that land?" It seemed to him clear that there had been such a disturbance by putting the extra weight on the subjacent unstable strata. He thought, therefore, that the plaintiff had made out his case, and he assessed the damages at £10 10s.



Overhead Electric Light Wires.—The case of *The Finchley Electric Light Co., Ltd.*, v. *The Finchley Urban District Council* was heard on Wednesday last in the Chancery Division of the High Court of Justice. The plaintiffs moved for an interlocutory injunction to restrain the defendants from interfering with electric wires passing over roads in their district. Mr. Buckmaster, in support of the motion, stated that as the defendant council refused to allow the plantiffs to carry wires under the road, the company accordingly carried them over the road at a height of 34ft. On October 1st the Council cut the wire, though the company had been served with a notice of the regulations of the Board of Trade and had complied with them. The

Council had no power to interfere with a wire that was 34ft. above the road. The Lord Chief Justice, in giving judgment, said that on the facts before him he must assume that somehow or other the plaintiff company had obtained the consents of the persons on the adjoining sides of the highway and had put up these wires at a height of 34ft. The defendants' offer was not to keep matters *in statu quo*, but to keep a state of things brought about by their own act, which might be wrongful. The plaintiffs were entitled to an injunction in terms of the notice of motion until the trial, the costs of the motion to be costs in the action. The defendants, however, would have liberty to apply in case there should be grounds for relaxing the injunction.

Insufficient Lighting of Road Excavations.—In the Liverpool County Court recently, Arthur Shine, a foreman painter, sought to recover from Messrs. Hughes and Stirling, building contractors, of Bootle, the sum of £50 for personal and other injuries caused by the alleged negligence of the defendants in failing to sufficiently light and fence excavations made by them in the highway between Rainhill and Prescot. The plaintiff's case was that on June 29th last, about 10.30 p.m., he was cycling to Liverpool, and when in the neighbourhood of Prescot he had to pass a place where the highway had been partly blocked for tramway construction or repairs. The defendants were the contractors, and they had there a watchman, and lights on one side of the thoroughfare, but there was nothing to warn the public of any danger in passing on the other side, which apparently was left open for traffic. After riding past the watchman's fire, and while going at a moderate speed the plaintiff suddenly fell into an excavation between the tram lines. For the defence it was contended that the road was properly fenced, lighted and watched. The jury, however, awarded the plaintiff £30 and costs.

Correspondence.

Sir Simon Leach: His Monument.

To the Editor of The Builders' Journal.

Sir,—The remote village of Cadeleigh, not far from Tiverton in Devon, possesses an interesting village church, the crowning glory of which is a magnificent Jacobean monument with life-size sculptured figures surmounted by a heavy canopy; a most complete and handsome example of the gorgeous Renaissance period. The monument was erected by Sir Simon Leach, a quondam sheriff of the county, to commemorate himself and his descendants, and in order to keep his memory green he also left a sum of money for the repair of the monument. Ill fortune however attended the family, and I believe it is now quite extinct in the direct line. The family mansion is a humble farmhouse, and the money that was left to keep the tomb in repair, although invested in land, has been allowed to lapse for the incredible reason that, in the sleepy meridian of the last century, no trouble was taken to collect the rents. When I saw the tomb a few weeks ago it was doomed to destruction. The canopy was falling backwards and was endangering the fabric of the church, and in a fortnight was to have been removed for safety's sake. For the time being the parish authorities are holding their hands, while I am doing my best to arouse interest in what is the finest example of the period in Devonshire. It will be a standing reproach if the tomb be destroyed, or allowed to be removed from the church in which Sir Simon worshipped and in which he desired to rest with his wife and children. The cost of underpinning and preserving the monument will be only £80, of which about £25 has been promised. The parish is very poor and the population small. May I appeal through you to the many lovers of the ancient and picturesque relics of our country for help in the work of preservation. It is not desired to restore, only to preserve. Many Devonians in London will, I am sure, send a small subscription for the sake of the old county. The most trifling sum will be gratefully received by Miss Chichester, Calverleigh Court, Tiverton, or by—Yours truly,

PRESCOTT ROW.

The Homeland Association, 24, Bride Lane, E.C.

BURY ART GALLERY.

The Bury Art Gallery and Public Library, which was recently opened, is situated at the corner of Moss Lane and Silver Street, in the borough of Bury, and has a frontage to Moss Lane of 110ft., and to Silver Street 105ft. The structure comprises three complete storeys: basement, ground, and first floors, with a sub-basement under the rear for the heating and ventilating plant. The first floor is entirely devoted to art, and is approached from a sculpture hall on the ground floor by a spacious stone staircase. There are five galleries arranged in sequence, the sizes varying from 27ft. by 33ft. to 27ft. by 61ft. Provision is made for cloakrooms, &c., and at the back of the building there are suitable rooms for book repairing. A large hoist connects the loading way with all floors. The ground floor has been devoted to library purposes, and is reached by a vestibule from Silver Street. The basement is chiefly devoted to stores space under the library, and connected therewith is a large book store. At the rear of the building is a loading way for receiving books, pictures, and a hoist and packing-room. The principal elevations are faced with boasted ashlar, obtained from the Higher Stancliffe Quarries, Darley Dale, Derbyshire; the remaining elevations are faced with Ruabon bricks. The joiners' work generally is Kauri pine, stained and varnished. The gallery floors are laid with oak parquetry, the library with oak blocks, and the reading-rooms with pitch-pine blocks. The vestibules and halls have mosaic floors, and the steps, landings, &c., for the staircases are blue Shepley with Bath-stone balusters and handrail. The building is heated and ventilated on the "Plenum" system, being of fireproof construction throughout, and lighted by electricity. Messrs. Thompson & Brierley, of Bury, have been the general contractors, and there have been many sub-contractors. The furniture and fittings have been executed in Dantzic oak by Messrs. Goodall, Lamb & Heighway, Manchester. The whole of the work, including the fittings, has been carried out from the designs, and under the supervision of the architects, Messrs. Woodhouse & Willoughby, of Manchester, whose design was chosen in an open competition.

GOSPORT LIBRARY AND TECHNICAL INSTITUTE.

A new Free Library and Technical Institute for Gosport and Alverstoke was opened recently at the corner of Clarence Road, South Gosport. The total cost has been between £7,000 and £8,000. The public entrance to the free library department is placed in the centre of the Walpole Street facade, the entrance porch giving direct access to the lending library, the reading and news-room, the reference and reading-room, and the librarian. The rooms in the art department occupy the whole of the first floor area of the front, or Walpole Road elevation. The technical institute is placed in the return block facing Clarence Road. The accommodation provided comprises the following rooms: on the ground floor a physical laboratory, a chemical laboratory, and a class-room; and on the first floor a cookery room and two large classrooms. The caretaker's rooms are placed in the upper stage of the tower. The works have been carried out by Messrs. Rashleigh & Son, of Southampton, under the immediate supervision of Mr. H. Frost. The architect, whose design was selected in a limited competition, is Mr. A. W. S. Cross, M.A., F.R.I.B.A., of 58, Conduit Street, Regent Street, London. A modelled plaster frieze over the library entrance was designed and executed by Mr. F. E. Schenck. The centre portion depicts the landing of Henry de Blois on what is now the Gosport shore, and the east and west panels are emblematic (1) of Henry Cort, whose works were situated on Gosport Green and by the river Meon at Funtley, about 1785; he was an inventor, and we have to thank him for discovering the process of converting hard pig iron into a soft and malleable condition. He is said, also, to have been the first man who constructed a system of drawing wrought iron into bars by means of grooved rollers. The result of his improvements and the introduction of his furnaces caused the output of iron in England and Wales to suddenly jump from 150,000 to millions of tons per annum; and (2) of the Lady Alwara, the wife of the Saxon Thane, Leowin, from whom Alverstoke is said to get its name.

THE SAD CASE OF LIVERPOOL CATHEDRAL.

BLOMFIELD v. GLADSTONE.

A LIVELY debate concerning the proposed Liverpool Cathedral has been going on in the "Times" between Mr. Richard Blomfield and Mr. Robert Gladstone. Referring to the latter's speech at the meeting of the Executive Committee (see page 161 of our last issue) in the course of which he stated that "there could be no question whatever in the minds of thinking people that Gothic architecture produced a more devotional effect on the mind than any other which human skill had yet invented," Mr. Blomfield says:—

"Mr. Gladstone was good enough to supply the dates of the precise period of Gothic (1220-1320) which commended itself to the judgment of himself and the Committee, and the Committee unanimously resolved that the style of their new cathedral is to be Gothic and nothing else. They also resolved on a method of procedure exactly calculated to prevent any architect of standing and experience from competing.

"Their method of procedure is an affair for the Committee, but their assumption of authority on a point of architecture can hardly pass unchallenged.

"In the first place, the result of their decision will be that the architects who do submit designs will have no voice in the question of treatment. The Committee have taken on themselves this special and essential function of architecture, and the architects are merely to prepare designs to a selected set of details, for we know by painful experience that by 'Gothic' is understood a more or less exact reproduction of some mediæval building. Under the circumstances the Committee are hardly likely to get a tolerable building, more especially as the method proposed for obtaining designs has been condemned by competent opinion for the last thirty years.

The Amazing Dogma.

"This, however, concerns the Committee and the architects who compete. The amazing thing about the whole proceeding is to hear in 1901 a dogma as to the sacrosanctity of Gothic architecture (and even of a certain period of it) solemnly propounded and assented to by a committee of influential laymen and others responsible for a very important building enterprise. We seem to be back in the fifties, when this sort of view was taken as an article of faith by ardent young amateurs with High Church propensities. Were it not for the probable consequences there would be a pleasing interest in this quaint revival, sixty years out of date, of the views of the Cambridge Camden Society. Mr. R. Gladstone finds his devotions quickened by the pointed arch, but surely this is rather a slender foundation on which to raise a law that this and no other is to be the only possible type of building under which future generations may devoutly worship. He appears to have forgotten that the Roman basilica was the original of the Christian Church, and that for some eleven centuries Christians had to content themselves with the spiritual encouragement of the round arch or the lintel. Yet it is probable that these Christians had a capacity for devotion not inferior to that of the Liverpool Executive Committee, and the growth of Christianity does not appear to have been retarded by the absence of the pointed arch. It is surely the *reductio ad absurdum* of religious devotion to make it conditional on cusps and crockets.

"No one would for a moment dream of reviving the futile old controversy of Gothic and Classic, a controversy based on a misconception of the nature of architecture; but what every intelligent person contends for is that in these matters there should be a fair field and no favour. Professor Simpson, as the president of the Liverpool Society of Architects, has put the matter clearly to the Executive Committee, but the Committee rises superior to expert opinion with some astounding results to the logical mind. Either the spiritual thought and feeling of modern Liverpool are the same as those of the cathedral builders of the thirteenth century or they are not. If they are the same, no doubt the language of the builders of Salisbury will precisely express the aspirations of the Liverpool merchant and mechanic of this century; if they are not the same that language becomes meaningless as an expression of modern thought, and to insist on its use is to reduce the art of architecture to a masquerade and a sham. No doubt the sapience of the Committee will find its way out of the dilemma and give the mere expert another necessary lesson."

Mr. Gladstone's Reply.

In reply to Mr. Blomfield, Mr. Robert Gladstone says, in a letter to the "Times," that "while classical architecture has naturally been the prevailing style in the south of Europe, Gothic in one form or another has been almost universally adopted for ecclesiastical buildings in this country. May I remind Mr. Blomfield that all our cathedrals, with the single exception of St. Paul's, are Gothic, and an overwhelming majority of our parish and other churches are in the same style? So strong is the general feeling in favour of Gothic for our churches that I have little hesitation in saying that, if the style for our cathedral had been left open, nine-tenths of the designs submitted by architects would be Gothic. In support of this opinion, may I remind Mr. Blomfield that in the previous competition for a Liverpool Cathedral in 1884 the second and third premiums were gained—with the approval of our assessor, Mr. E. Christian—by Gothic designs; and the first prize, given to Mr. Emerson, was for a design specially calculated to be in harmony (so far as possible) with the adjoining classical buildings?

The late Sir Gilbert Scott on Westminster Abbey.

"As regards the effect on the eye and mind, let me quote what the late Sir Gilbert Scott said in an address to the Institute of British Architects regarding Westminster Abbey:—

"'—A building which does not owe its claims upon our study to its antiquarian and historical associations, intensely interesting though these must be to every man worthy of the name of an Englishman. It has claims upon us architects—I will not say of a higher, but of another character—on the ground of its intrinsic and superlative merits as a work of art of the highest and noblest order; for there are few churches in this or any other country having the same exquisite charms of proportion and artistic beauty which this church possesses; a beauty which never tires, and which impresses itself afresh upon the eye and the mind, however frequently you view it, and however glorious the edifices which, during the intervals, you may have seen.'

"Such is the type which we have adopted for our cathedral. Is it an inferior one? Can Mr. Blomfield suggest a nobler one? If he can, let him at once tell us what it is, and, in the interest not only of Liverpool but of our country, give us an opportunity to consider it.

A Little History.

"I have not forgotten that the early Christians converted the available basilicas into churches, nor do I forget how the apse with its railings became the chancel of later times. I have been a student of architecture for forty years, and am not ignorant of the rise and fall of Gothic architecture; of how it emerged from the clumsy grandeur of Norman, attained its most sublime beauty during the hundred years to which I referred, and then by the elaboration of pretty details it gradually deteriorated until architects in despair called in the more sturdy accessories of the Grecian and Roman Orders to revivify their expiring art. After a while this classical resuscitation passed away, to be succeeded by a revival of Gothic, wretched enough for many years, but now better understood and exhibiting in many places much of the spirit of our old cathedral buildings.

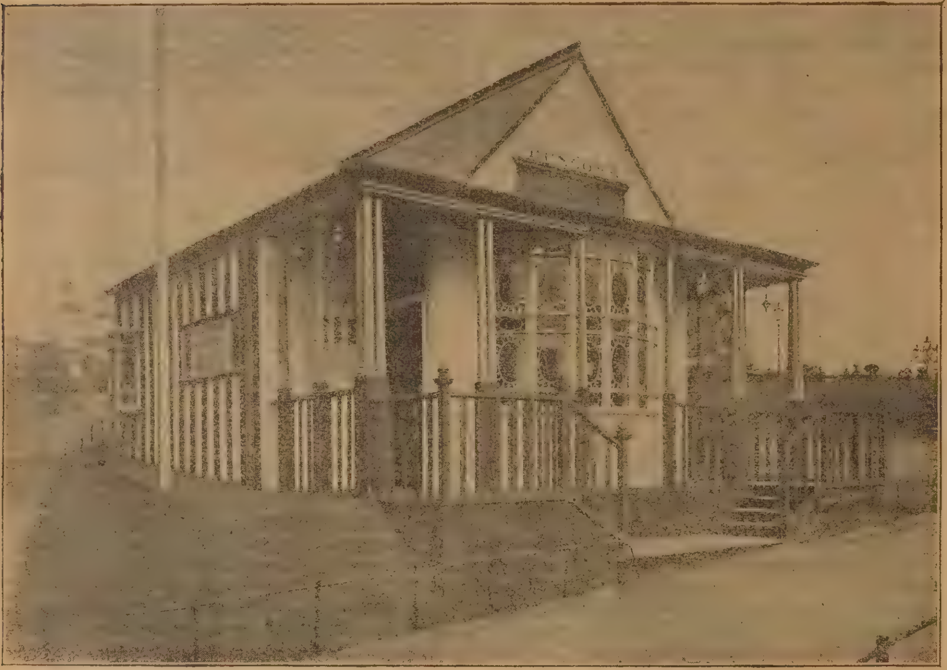
The Abbey as a Guide.

"We are told that Gothic is again passing away.

It may be so; but what do our leading architects offer us in its place? At present it may be truthfully asserted that no new style of architecture has been invented, unless it be the glass and iron construction of the Crystal Palace; and in these circumstances I feel that if we take the interior of Westminster Abbey as our guide in building Liverpool Cathedral we shall follow the most beautiful and most devotion-inspiring example of church architecture that this country affords. In conclusion, I say to Mr. Blomfield, 'Si quid novisti rectius istis, candidus imperti; si non his utere mecum.'"

The Challenge Accepted.

Mr. Blomfield takes up Mr. Gladstone's challenge:—"The number of issues he (Mr. Gladstone) raises is somewhat bewildering. He adheres to the position that 'Gothic' is the only possible style for a cathedral. He quotes Sir Gilbert Scott on Westminster Abbey, and he asks me to supply him with a new style in architecture. The dilemma which I put before him he has not attempted to answer—perhaps it is unanswerable; but he remarks incidentally that had the design been left open 'nine-tenths of the designs submitted by architects would be Gothic,' to which I need only reply that it depends on the architects. The authority of Sir Gilbert Scott, moreover, will hardly convince contemporary architects, but Scott was a very able man. Whatever his practice he knew good work from bad, and in the quotation which Mr. Gladstone supplies us he praises Westminster Abbey, not for its historical associations, nor for its fitness for modern necessities, but solely as a beautiful work of art in itself. So far as any relevance to modern thought is concerned Mr. Gladstone might just as well have quoted Professor Cockerell on the Parthenon.



THE BENSON PAVILION AT THE GLASGOW EXHIBITION.

Of Restrictions to Styles and the Real Architect.

"But the points at issue between architects and the Committee are more serious than this. In the first place, there is the general question of the restriction to any style at all; in the second place, the restriction to Gothic, and even Gothic of a certain specified period. Now, in restricting designs to any style at all the Committee have misapprehended the work and duty of an architect. The popular conception of an architect is that he is a man who sits down and makes pretty drawings, or, if he does not, employes somebody else to; that he hands these over to the builder, and that this, artistically, is an end of the matter. Of the underlying process of thought, of the careful consideration of all the bearings of the problem, of the deliberate selection of one out of many experiments of the imagination that every architect worthy of the name must go through before he puts pencil to paper, the Committee seems to have had no sort of suspicion at all, for they blandly undertake the preliminary process themselves and inform architects that their designs are to be Gothic, and even English Gothic of the thirteenth century. Architects may, and probably will, form an entirely different estimate of the situation. They may think that an architectural language which has long since died a natural death is inadequate to express the teeming thought and emotion of modern life. In any case, whether they do or do not, they would probably be unanimous in agreeing that this essential function of the expert should not be taken out of his hands. Architecture is a serious art, and not the mere plaything of cultivated amateurs, and I think it improbable that any architect properly so called would undertake such an enterprise as this with his hands tied.

Why "Gothic"?

"In the second place, we come back to the old question, Why 'Gothic'? Mr. Gladstone reminds me that all our cathedrals are Gothic 'with the single exception of St. Paul's'—truly a formidable exception. May I also remind Mr. Gladstone that at the date when those cathedrals were built no other style was possible or even dreamt of, and hence the admirable sincerity and individuality of these cathedrals—qualities which the most ardent Classicist will readily admit. But what are we to say now, when the whole world of 'styles' is open to a designer? Is there any sincerity of expression in reproducing a dead language? (for that is the serious intention of the Committee's resolution); and even if Gothic architecture did express the thought and feeling of a number of people, it is quite certain that it does not express the feeling of everybody.

A Comparison between St. Paul's and Westminster.

"There are those, and it is possible that they are not a minority, who would find the dome of St. Paul's Cathedral at least as suggestive of religious thought as the clearstory of Westminster Abbey; for, after all, a cathedral is not a church adapted to one particular congregation or to one particular shade of theological opinion. A cathedral, one would think, should provide for all shades of thought and opinion that may fairly meet within its walls, and one cannot protest too strongly against this narrow identification of religious worship with one particular phase of architecture.

A Model for the Cathedral of the Future.

"Mr. Gladstone asks for a 'style,' but we are sick of styles. Nowadays every man must think for himself, and nobody reaches style unless he can carry his own individuality into the expression of his thought.

"The less, therefore, we hear of styles the better for architecture; but if Mr. Gladstone really wants a model for the cathedral of the future let him look for it among the ruins of the Baths of Caracalla at Rome."

In further reply to Mr. Blomfield, Mr. Robert Gladstone says: "The great central room in St. George's Hall, Liverpool, is said to have been designed from one of the thermæ at Rome, and as a place for public ceremonies and musical festivals it is magnificent; but it would not be suitable for a church. Indeed I do not hesitate to say that Italian architecture is not suited to ecclesiastical buildings in this country, for which we prefer our national Gothic. In proof of this may I point to the Cathedral at Truro, the new Cathedral at Edinburgh, and the splendid church lately built by Mr. Austin at Stockport, all of which are Gothic? . . . . . It is possible, perhaps, that in some quarters a hope is entertained that in an unlimited and unrestricted competition something would turn up which might prove to be an entirely new and completely satisfactory design for a new cathedral; but what reason is there for expecting this?"

H. C. S. asks Mr. Blomfield "to give a reason for our resuscitated old friend, the assumption that 'Gothic' is the only 'dead style'? How is it different from either Greek, Roman, Classical Renaissance, or the new pet the 'Adam,' style?"

Builders' Notes.

Mr. William Woolaway, a well-known Barnstaple builder, died recently at the age of fifty years.

Mr. John Booker, of Beaumont Terrace, Bognor, the eldest partner in the firm of Messrs. Booker Brothers, builders, died recently.

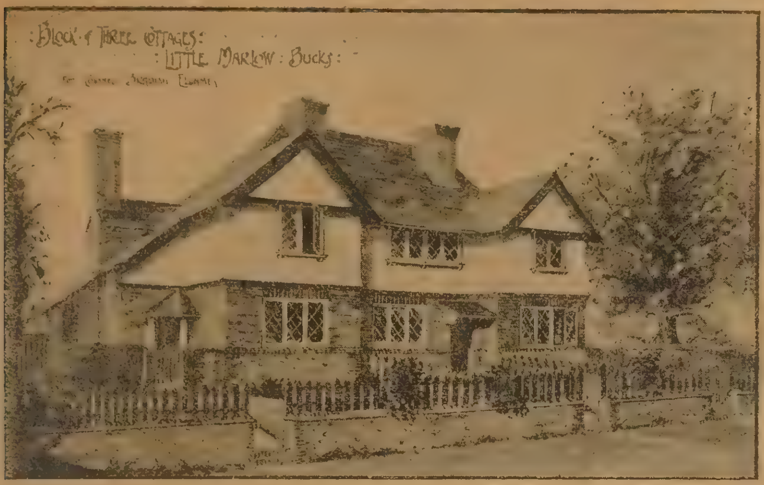
"La Pierre Artificielle."—This is a title of a new eight-page monthly journal which has just been issued. It is published at 9, Rue Montenotte, Paris. The annual subscription is six francs in France and eight francs (6s. 8d.) abroad.

Insanity among Workmen.—As the result of enquiries into the subject of last year's admissions to London asylums, Mr. N. W. Hubbard, L.C.C., has found that of 1,671 male patients received, 286 were labourers, 54 painters, 38 carpenters and joiners and 14 bricklayers.

A Catalogue of Builders' Goods.—Messrs. Young & Marten, the well-known builders' merchants, of Stratford, E., offer to supply copies of the latest edition of their catalogue to builders free. As this large book is fully illustrated and contains particulars and prices of almost every class of goods used in the building trade it will doubtless be much sought after.

A "Ring" in Corporation Contracts.—The Manchester City Council recently advertised for tenders for the concrete foundations of engine-beds and the building of two chimneys at the Stuart Street electric-power station. Two were lower than a third by over £1,000, but no time for the completion of the work was stated. One of the two contractors was asked by a councillor to state a time; but as this practically gave the firm two chances, fresh tenders were advertised for, with the result that the third contractor's tender was lowest, except for a fourth firm whose tender was £126 lower; but this latter giving no date for completion, the third firm's tender was accepted. It was then alleged that there was a "ring" among the Manchester builders to work the Corporation contracts, but this is authoritatively denied by the Master-Builders' Association.

London County Council.—At last week's meeting of the Council a very lengthy report was submitted by the Improvements Committee stating the facts in connection with the proposed widening of Piccadilly between Hyde Park Corner and Walsingham House. In conclusion it was stated that the formal consent of the First Commissioner of Works was only now needed for the widening to be proceeded with, and a letter had been received from Mr. Akers-Douglas stating that he would see the Committee in a fortnight or three weeks. The report was received with considerable discussion.



ARTHUR E. THOMPSON, ARCHITECT.

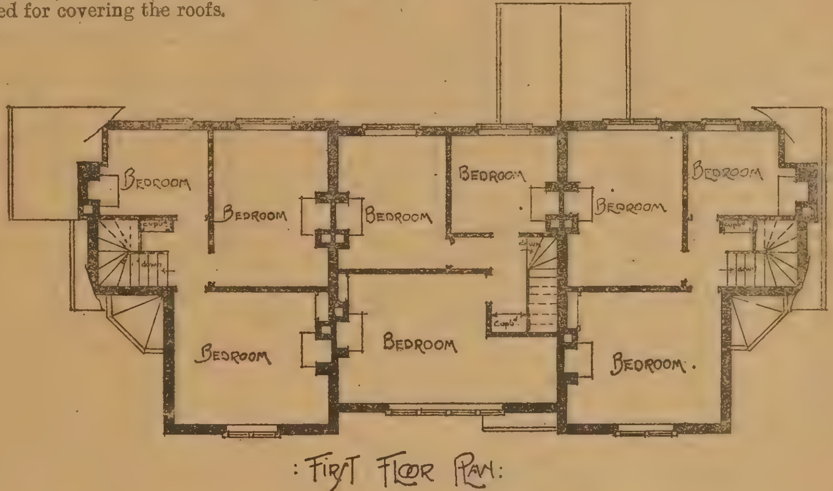
in the course of which Mr. John Burns, M.P., said that he would rather have the opinion of cabmen and the police than all the Royal Academicians who spent their leisure time in writing to the "Times." If they went to the other side of Piccadilly the widening would cost £1,250,000 or £1,500,000 instead of £30,000. They would never again get such an opportunity.—Mr. Bruce, replying to a question, said that the pedestal for the Boadicea group at Westminster Bridge had proved a difficult matter. A contract was made many months ago with the Bude Quarries, but owing to a strike no masons could be got to cut the stone. Considerable pressure was brought to bear, and the stone was sent up to Aberdeen to be worked. When it reached London it was condemned by the architect of the Council. Other stone was sent to Aberdeen, which was also condemned. Then the Works Department took the work in hand, and granite was bought in London and placed on the site. That stone was satisfactory, and it was hoped that the work would be finished this month.—Replying to another question, Mr. H. Ward said there had been considerable delay in the rebuilding of Vauxhall Bridge, and the work would not be finished for at least another twelve months.

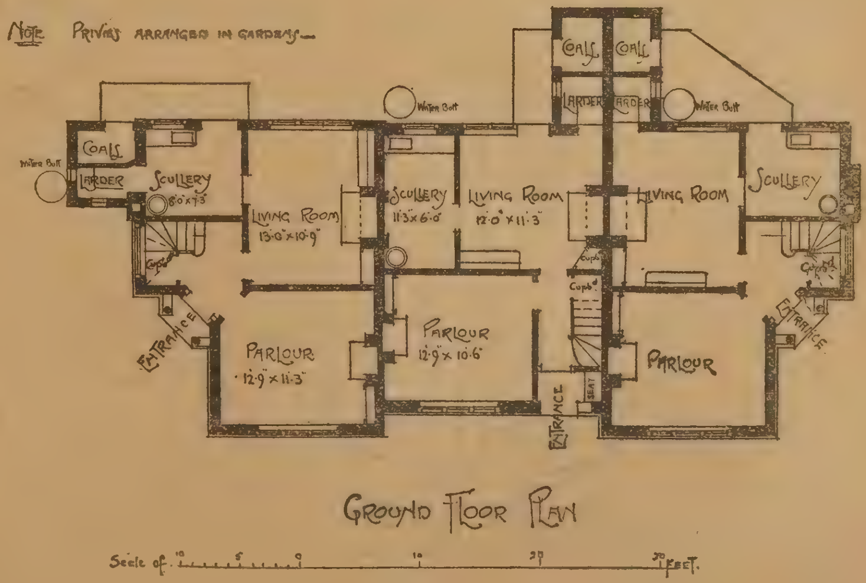
A New Unionist Club at Alloa has been erected at the corner of Union Street and Coalgate. The following were the contractors: mason and brick work, Mr. James Philip, Tillicoultry; carpenter and joiner work, Mr. Robert Keir, Tillicoultry; slater work, Mr. John Walker, Alva; plaster work, Mr. James Grant, Alloa; plumber work, Mr. James Philip, Alloa; painter work, Mr. John Robertson, Alloa; upholstery work, Mr. James Rigg; electric lighting, Messrs. Loudon Bros., Dundee. Messrs. John Melvin & Son, of Mar Street, Alloa, were the architects.

The Benson Pavilion at the Glasgow Exhibition, illustrated on the opposite page, was designed throughout by Mr. W. A. S. Benson, of New Bond Street, and is a combination exhibit of art work by London firms. The well-known Benson electric fittings and metalwork are shown in the small offices which lead off the main room, at one end of which is a showcase containing glass made by Messrs. James Powell & Sons, of Whitefriars. The wallpapers are by Messrs. Jeffrey & Co., of Essex Road, Islington; while the grate in the large room was designed by Mr. Ernest Newton and made by the Falkirk Iron Co., the tiles enclosing it being the work of the Pilkington Tile and Pottery Co., of Manchester. The front Benson bay window is clearly shown in the illustration. Its chief points are that the circular uprights allow bays of any angle to be constructed, and the panels and casements are designed in graduated sizes, so that they can be accommodated to a wide range of openings; moreover, the window is supplied complete with mullions, the sections being simply secured together. The roof and outer walls of the pavilion are of "Texyl," which consists of a combination of corrugated sheet iron and cement: in this case "Petrifite" has been used.

A BLOCK OF COTTAGES.

THE block of three cottages on the manor of Little Marlow, Bucks, illustrated on this page and designed by Mr. Arthur E. Thompson, of Leadenhall Buildings, E.C., is being erected for Colonel Bradish Ellames at a cost of £656 (including the front boundary wall) by Messrs. W. and T. Sellman, of Great Marlow. The cottages are built of brickwork throughout, faced with rough-cast above the first-floor level, and with red bricks below and split flintwork in the plinth. Diagonal lead-lights are being used in the windows, and old tiles have been specially obtained for covering the roofs.





Engineering Notes.

Messrs. Thomas Crapper & Co., of Marlborough Works, Chelsea, London, S.W., have been appointed Sanitary, Warming and Ventilating Engineers to His Majesty the King.

The First Section of the New Water Scheme for Belfast was successfully inaugurated recently. The water is being brought from the Mourne Mountains, a distance of forty miles, and the works are estimated to cost one and a half millions sterling.

Three New Railways have been opened in Scotland. The most important is that to Lochearnhead by an extension of the Crieff-Comrie line. A second railway is the Shrieldmuir, Wishaw, and Newmilns line, which will serve iron and coal centres. The third is a light railway to Leadhills, the highest inhabited town in Scotland.

Waterloo Railway Station is to be extensively altered at a cost of £750,000. The platforms are to be increased in length and new buildings erected. The station will have a new front with the main entrance in the Waterloo Road, but an approach is to be constructed from the Westminster side, and passengers will be able to drive direct to and from the platforms at which the trains stand.

Mr. Bernard Shaw and Ventilation.—Mr. G. Bernard Shaw, who is a member of the St. Pancras Borough Council, objects to the atmosphere of the local Town Hall after the full Council has been sitting some time, and will move at the next meeting that, in view of the fact, it be an instruction to the Public Health Committee to report to the Council at an early date as to the best means of providing a sufficient supply of properly filtered and warmed fresh air to the Council chamber during the winter months.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"*Your own character will form your style . . . but my business is to prevent, as far as I can, your having* any *particular style.*"—RUSKIN.

Our Plates. COLES FARM, BOX, about six miles from Bath, is a fine old farmhouse commanding splendid views of the surrounding country. It was erected in the seventeenth century, and still remains with the descendants of the original builder. The exterior is a plain stone structure with well-proportioned gables and chimneys covered with ivy. The dining-room is the chief feature of the house, on account of its beautiful oak panelling, dated 1649, and very richly-modelled plaster frieze and ceiling. Unfortunately, it has been empty for some years, and has fallen a prey to the rampant species of old furniture hunters, to judge by the gaps in the panelling. Nearly one-third of the oakwork has disappeared since the spring, including the carved date panel which gave the value to the whole room.—The new baths and washhouses for St. Pancras, which have been erected in Prince of Wales Road, Kentish Town, were opened recently. The site cost about £18,000, and the buildings consist of four swimming baths and 129 slipper baths, together with a public washhouse with fifty washing compartments. There are frontages to three roadways. The men's first-class swimming bath is 115ft. 6in. long and 50ft. wide, the actual bath being 100ft. by 35ft., and there are eighty dressing boxes, all made to remove during winter. At the deep end of the bath a large diving stage and a water chute have been provided, and an overhead shower can be obtained by means of sprays from the ceiling, which has been designed to prevent the splashing echo. A gallery is also provided capable of seating about 450 persons. During the winter months the swimming pond of the bath will be floored over and will be used for concerts, &c. It will have seating accommodation for 1,200 persons. The men's second-class swimming bath has a pond the same size as that in the first-class bath, and there are 108 dressing-boxes with accommodation for 150 bathers. The two other swimming baths are smaller and will be for women. In the public washhouse electric irons will be used. Refreshment-rooms and a *crêche* have been provided. The buildings throughout are lighted by electricity, which also supplies nearly all the motive power. Two artesian wells are being sunk on the premises, which, it is hoped, will yield between them about 25,000 gallons of water per hour. The cost of the buildings, together with all machinery and fittings, has been about £75,000.

Mr. Lockwood Kipling. MR. LOCKWOOD KIPLING, who has illustrated "Kim," Mr. Rudyard Kipling's new story, has long held the reputation as one of the highest living authorities on Indian native art. From his first entry into the Indian Service as an architectural sculptor in 1865 until his retirement in 1893 Mr. Lockwood Kipling unceasingly endeavoured to raise the standard of artistic culture in India. Whilst his designs for the pavilion at the Delhi Imperial assemblage and for the heraldic banners presented there to the chiefs testify to his originality and fertility with the brush, the Mayo School of Art and the new museum at Lahore bear witness to his ability as an architect. His first considerable literary work was a description of the Hindoo village system of the Deccan, to elucidate which he prepared the elaborate series of drawings now preserved at the South Kensington Museum. In 1875 he started the Lahore School of Arts and Designs, and one of his first pupils was Ram Singh, who afterwards designed for Queen Victoria the new dining-room at Osborne.

Monuments in Berlin. THE Kaiser has decided that the right and northern semicircle outside the Brandenburg Gate, towards the Siegesallee and the Reichstag building, Berlin, shall be the site of a monument of his father, the Emperor Frederick. The Emperor has also decided to erect a monument to his mother, the late Empress Frederick, on the southern semicircle. The houses round the Brandenburg Gate will be removed, so that the monuments may be clearly visible from Unter den Linden. The Emperor has entrusted the execution of the Empress Frederick monument to Herr Hans Everding, a young sculptor of five-and-twenty, now in Rome, whose acquaintance he made at Cassel. Everding won a small gold medal at the Art Exposition in 1898. The adjoining graves of two celebrated Parliamentarians—Lasker and Bamberger—are about to be covered with a large and richly-ornamented stone and surrounded with an iron railing. On this stone will be placed a monument of polished Norwegian granite, flanked with two lofty pillars, between which will be placed a dedicatory tablet of bronze. The monument has been designed by the State architect, Thierbach.

The Manchester Monument of Queen Victoria. THE Manchester Queen Victoria statue, which was unveiled recently, is the work of Mr. Onslew Ford. It was exhibited at this year's Royal Academy. The Queen is seated on her throne, the sceptre in her right hand, the orb in her left, and a coronet upon her head. She wears her Garter robes, with the sash and star of the Order on her breast. Queen Victoria gave Mr. Ford a sitting for the statue some three years ago, and the features of the Queen in the statue are a likeness of Her Majesty as she then appeared. The dress worn by the Queen when she sat as a model for the sculpture was of fine lace, and under the coronet a veil is draped. From its base to the top of the coronet the statue is 9½ft. in height. The height of the Chair of State on which the Queen is seated is 19ft., and of the pedestal 5ft. This is reached by half a dozen 6-in. steps. The chair is sculptured in Mazzano marble, and the design may be described as Renaissance. In a division between the mouldings at the top of the back of the chair is a representation of St. George and the Dragon, and above the head of the Queen the Royal Arms are engraved. Mr. Ford considered that it would be unwise to leave his work in such a condition that while the obverse was a specimen of the skill of the sculptor, the reverse, as seen by people seated on the benches in Piccadilly or from the windows of the infirmary, would be a large blank space. He therefore designed and executed an allegorical figure of "Maternity." This comprises a partially draped female holding two young children. This figure is sheltered in a niche behind the statue. Above its head are the arms of the Manchester Corporation. The figures of the Queen and "Maternity" are in bronze, and they consequently will not suffer from the exposure to the weather and the Manchester smoke. The statue and its accessories have cost about £6,500.

The Kaiser's Taste in Art. A REMARKABLE article on the Kaiser's views on art appears in the "Vorwärts." It will be remembered that his Majesty objected to the "fairy tale" fountains which it was proposed to erect in the Friedrichshain, on the ground that they were too imposing and architectural. He suggested something simpler which could be more readily grasped by the working-class children who play in the Hain; something more "kindly cheerful" as he expressed it. The leading Socialist journal is able to detect two distinct trends in the Kaiser's views on art matters. On the one side he admires the pompous and magnificent, laden with mythological ornament. This style he reserves for what the "Vorwärts" calls his "Hohenzollern" work, for work devoted, for example, to the glorification of the old Kaiser and Bismarck, for the marble squadrons of Victoria Avenue, &c. On the other side he demands that the people shall have the simplest art possible, something innocent and easily understood. He objects to complicated music for the people, to drama which excites or causes discontent, for example Hauptmann's "Weavers." In this way, the "Vorwärts" explains the Kaiser's dislike of the proposed "fairy tale" fountains. In front of his Schloss and in Victoria Avenue are suitable sites for the architecturally imposing, but for the people in Friedrichshain he wants something simple and agreeable. It is only fair to add that the "Vorwärts'" sweeping generalisations are hardly justified by anything that has yet occurred.

Battle Abbey. THE world-famed Battle Abbey, whose associations are so indissolubly interwoven with the history of the English people, will shortly be submitted for sale at the Mart, Tokenhouse Yard. Founded in 1067 by William the Conqueror, who, in pursuance of a vow made on the eve of the battle of Senlac, erected on the site of the struggle the Benedictine monastery of St. Martin of Battaille, and endowed it with all the lands within one league, but little of the original structure has survived the Dissolution by King Henry the Eighth in 1538. The Conqueror's sword, deposited in the shrine with the roll of his barons, has long since been lost, while the latter, which was extant in 1793, is supposed to have perished in that year in the burning of Cowdray House, near Midhurst, Sussex. Of the building itself there are still the ruins of the high altar of the Abbey Minster, traditionally supposed to stand on the spot where the ill-fated King Harold received his death-blow, and the wall of the west nave near the Cloister Garth, containing in one of its inner niches the remnant of a stone sarcophagus, and adjoining the site of the Holy Well. Parts of the refectory, with its graceful and lofty Early English lancets, are also preserved, while the Gate House, added in 1338 by Abbot Retlynge, and composed of a central tower over 50ft. high, with octagonal turrets and panelled battlements, forms, with its beautiful tracery, canopied niches and windows and interlacing arches, one of the finest specimens of the Decorated period in the whole kingdom. Additions since the Dissolution are the Cloisters and Guest House attributed to Sir Anthony Browne, to whom the site, edifices and land were granted by King Henry the Eighth, while the late Duke of Cleveland, who purchased the domain in 1857, and reconstituted the north front as a country mansion, adopted a style of architecture entirely in keeping with the ancient battlemented structure. The Abbey grounds extend over about eleven acres, and points of interest are the Cameller Walk from which steps lead to the Sentinel's Wall on the battlements of the precinct wall, the famous yew walk next the precinct wall, and the freectory garden with its magnificent magnolia trees.

Masters and Men.

A New Building Trade Employers' Amalgamation.—A gathering took place at the Builders' Exchange, Leeds, recently, of representatives of the various National Associations connected with the building trades. For some time past efforts have been in progress for bringing into closer union the building trade employers. Meetings have been held in connection with the various trades affected, at which draft rules have been agreed upon. The representatives were engaged in making the necessary arrangements for propaganda work, &c. The name by which this association is to be known is that of the Federation of National Associations of Master Plasterers, Plumbers, and Slaters, and as the name indicates, will include these three National Associations, while the rules also provide for the inclusion of other national associations connected with the building trade. The principal object of the Federation is to promote the adoption of a common policy on all matters affecting the associated trades. The election of officers resulted in the appointment of Mr. W. R. Thompson, of Dewsbury, as president; Mr. A. Wheater, Leeds, vice-president; Mr. Dyson, Halifax, treasurer; and Mr. George Soall, Birmingham, secretary.

Victor Gherardi, a Young Sculptor, of Carrara, who is already well known in consequence of his collaboration in the decoration of the Church of St. Patrick, in New York, is now about to execute, by order of the Fine Art Commission of Chicago, a statue of Garibaldi. This monument, made entirely of bronze, will be erected in Chicago.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Sizes and Positions of New Windows in regard to "Ancient Lights."

Dulverton. — Exe writes: "Referring to the reply to my enquiry on page 127 of your issue for October 2nd, if the precaution you mention with regard to verified scale drawings showing the position of the windows in the old building are taken and a new building erected on the site of the old one, must the windows in the new building be of the same size and in the same position as the old ones (to prevent their being blocked by the adjoining owner at any future date), or may the total area of the new windows exceed that of the old ones?"

It would be unwise to alter either the size or position of the windows. Whether they were to be considered to be ancient lights or as new windows would be a point which, if taken into court, would admit of much argument, and the issue would be doubtful. As a general rule judges do not assist dominant owners to preserve these rights of easements so strictly as they used to do, especially where any attempt is made to enlarge an existing right. It should also be noted that any work of reconstruction should be done with moderate speed, as if by oversight or otherwise the window be out of existence for a whole year the right previously enjoyed would probably be held to have lapsed.

G. A. T. M.

Plate Glass and Temperature.

Croydon.—Enquirer writes: "Is it a fact that plate-glass windows tend to make the temperature of rooms more equable than the ordinary sheet or crown glass? If so, are there any means for discovering to what extent?"

To no appreciable extent; what little difference there is in the temperature is due to the thickness.

Restriction of an Architect acting as Clerk of Works.

Carlisle.—Simplex writes: "I am under agreement not to practise or be employed in carrying on the business or profession of builder, or architect and surveyor, or any other kind of business in competition with or in opposition to my employers. I now seek to become a clerk of works for a company during the erection of new premises (I am not to be the servant of the architect), but my employers dispute my right to do so. (*a*) Is it part of an architect and surveyor's business to undertake a clerk of work's work? (*b*) Is it usual for a firm of architects and surveyors to undertake a clerk of work's work or jobs where another architect of the same town is employed as architect? (*c*) Does the agreement prohibit me from taking up the duties of a clerk of works? (*d*) Would an injunction of restraint, with which I am threatened, be granted by a judge in such a case?"

It is always difficult, if not impossible, to say that a judge will certainly take a particular view of any case which may be submitted to him; but in the present instance there seems to be little room for doubt. The employers would probably have difficulty in upholding the restraining clause in any event, as it is drawn in an unjust and over-comprehensive spirit, but in the present instance they seem to be striving to apply it beyond even its very wide scope. The answers to the various definite questions therefore seem to be: (*a*) No; (*b*) No; (*c*) No; (*d*) Most unlikely. A local solicitor should be consulted to whom the whole agreement could be shown.

G. A. T. M.

Calculations in Designing Staircases.

Bristol.—E. E. M. writes: "Kindly give me an outline of the necessary calculations for the designing of staircases in cast-iron and steel?"

Staircases, of whatever material they may be made, are not usually the subject of calculation. In any particular case where it is desired to make calculation, as a check upon designing by the eye, the string is taken as a girder under distributed load equal to the maximum that can come upon it, the span being not the full length but the horizontal length between the supports. The factor of safety will vary with the material; say timber 10, cast-iron 6, wrought-iron and mild steel 4. Bent strings are calculated rather differently. The simplest way is to find the total load on support and then, taking this as reaction, find the bending moment at the knee of the string.

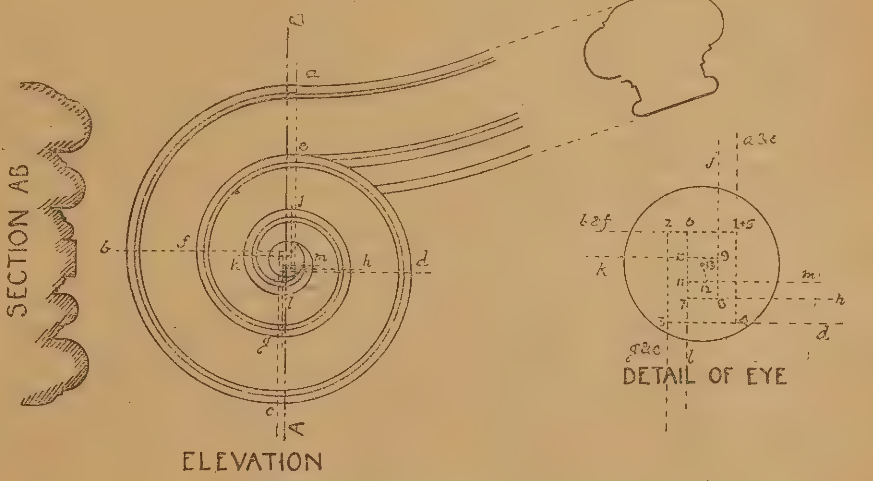
HENRY ADAMS.

Drawing Scrolls.

London, S.E.—G. W. writes: "Kindly give a quick and easy method of drawing a scroll for a handrail or other similar article. The methods given by various books consulted are too complicated and far from being easily remembered."

Naturally the quickest and easiest way to describe a scroll is to draw it freehand, relying upon your own sense of proportion for its correctness. Failing this, some such method as that given in the accompanying drawing must be adopted, but in this case the draughtsman will have to possess a passable knowledge of one or other of the mechanical methods of tracing a volute, as given in Normand's "Parallels" or Mr. Phené Spiers' book on the Orders. The principle involved is that of a circle divided into four parts by a vertical and a horizontal line passing roughly through the centre. Continuous quadrants of circles are then struck eccentrically and with gradually diminishing radii until the centre (or occulus) of the volute is reached. The volute here given was set out as follows: It was sketched *freehand* until it approximated to the required curve and was then divided into four segments by straight lines, and each quadrant was tried with the compass until its centre was found. Thus 1 (on detail of eye) was found to be the centre for a, b; 2 the centre for b, c; 3 the centre for c, d, and so on. It must be borne in mind that where two curves of different radii are continuous a line drawn from the point of intersection must cut the centres of both curves: *e.g.*, curves a b and b c, of different radii, meet at point b, and the line b 2 1 cuts their respective centres in 2 and 1, and similarly for each two curves.

R. W. C.



METHOD OF DRAWING A SCROLL.

Air-Space around Buildings.

Aberdare.—Cynow writes: "The enclosed plan of a house (not reproduced) is returned by the surveyor to an urban district council because it does not conform to section 58 of the council's by-laws with respect to new streets and buildings, and especially with the paragraph marked B. The by-law is as follows:—Every person who shall erect a new domestic building shall provide in the rear thereof an open space exclusively belonging thereto and of an aggregate extent of not less than 225 sq. ft., free from any erection thereon above the levels of the ground except a w.c. . . . (B.) He shall cause such open space to extend laterally throughout the entire width of such building, and he shall cause the distance across such open space from every part of such building to the boundary of any lands or premises immediately opposite or adjoining the site of such building to be not less in any case than 10ft. If the height of such building be 15ft., he shall cause such distance to be 15ft. at the least."

The particular cause referred to is based on clause 54 of the Model By-Laws issued by the Local Government Board. So far as can be ascertained from the plan submitted, the surveyor to the urban district council appears to be quite correct in pointing out that the plan does not comply with the local by-law mentioned. It is necessary that the required distance between the building and the opposite property shall belong exclusively to the building, and must not include any public road or passage at the rear of the building.

T. E. C.

Stable Drainage.

London, S.W.—G. A. P. writes: "I have some stable drainage arranged with drain pots to stalls and loose boxes inside the building, and disconnected from the main drain by an open gulley immediately outside the building, over which the drain pipes from pots to stalls, &c., discharge. Should this gulley be an ordinary trapped gulley, or a drain pot with silt-bucket, as used where stalls, &c., are drained by surface gutters? The drains outside the stable have a general fall of 1 in 40 and are not therefore likely to get choked with anything which could pass the drain pots and gulley. Inside surface drains are in this case strongly objected to and cannot be used."

The gulley outside the stable should be a trapped gulley, and fitted with a catch-basket or silt-bucket. The drain from the horse-pots should discharge under the surface grating of the outside gulley and immediately over the catch-basket. Suitable gulleys of this description may be obtained from Messrs. Broad & Co., or other manufacturers of sanitary appliances.

T. E. C.

Strength of Iron Tank.

London, E.C. — Hydraulics writes: "I should be glad to know how to calculate the weight on the sides of a cistern 20ft. by 10ft. by 6ft., and the strength of iron sides, &c."

There is much more in designing the tank than finding the pressure on the sides and the thickness of the plates. The designing of large tanks is work for a specialist, or at least for one with experience in designing or manufacturing them; so many points require minute attention, as witness the disastrous failures that have occurred at St. George's Hospital, the Crystal Palace, the West Ham Workhouse, &c. The pressure on the side of any cistern or tank containing water is—

$$\text{Area side, sq. ft.} \times \tfrac{1}{2} \text{ depth ft.} \times 62{\cdot}5 \div 2{,}240 = \text{tons}$$

and with any intermediate portion, such as the area supported by a stay, area × depth of its centre of gravity from surface × weight of a cubic foot of water = pressure in lbs. The centre of pressure is two-thirds of the depth from the surface, but this has no particular importance in tank designing. The writer's rule for thickness of plates in cast-iron is to make the top row ½in. thick and the bottom row by the formula—

$$t = \frac{d\sqrt{D}}{192}$$

where t = thickness of plate in inches; d = depth of plate in inches; and D = depth of lower edge from surface of water in feet: intermediate tiers to be graduated between these thicknesses and all plates to be properly stiffened by ribs, feathered flanges, and tie-bolts. In important cases the result should be checked by other formulæ. In the present case with a depth of 6ft. there would be two rows of plates, the top row ½in. thick, and the bottom row $\frac{36 \times \sqrt{6}}{192} = \frac{36 \times 2{\cdot}45}{192} = {\cdot}45$ which, being less than ½in., is to be increased to ½in. thick.

HENRY ADAMS.

Books for R.I.B.A. Preliminary Examination.

GLOUCESTER.—J. L. M. writes: "Please give me a list of the books necessary for the R.I.B.A. preliminary examination."

A list of books and advice to candidates is given in the R.I.B.A. Kalendar, to be obtained from the secretary of the Institute, 9, Conduit Street, W., price 2s. 6d.

Fees for Plans and Superintendence.

ABACUS writes: "I agreed with a client to prepare plans and specification of some houses, and to superintend their erection for the sum of £50. The houses are now being built, but the client states that my services are no longer required. No fault is found with me. I have received £20 on account; am I not entitled to the balance of £30?"

If the contract for the £50 was made either verbally or in writing, you are entitled to be paid in full. You do not state if the £20 was sent with the note of dismissal as in full settlement of account. If it was, or afterwards, and you signed a receipt, you cannot recover. If it was paid by cheque you should have returned it, as we think it would be held that acceptance implied full payment. If the money was tendered in coin of the realm and no receipt given, or only one as on account, you can sue for the balance. If the £20 was received on account before the note of dismissal, your case is strengthened materially.

On Becoming an Electrical Engineer.

BALLYMENA.—M. R. H. writes: "I am a matriculated student of the Royal University of Ireland. I am seventeen years of age and have spent one year in a civil engineer's office. I wish to pursue electrical or mechanical engineering and require information as to how to proceed."

Electrical engineers should first go through a course of mechanical engineering. They may then spend a few years on general electrical work and afterwards specialise in the particular branch which they favour. You should attend a technical school first, or enter some engineering works in your neighbourhood. When you have thus acquired a grounding, you may move to an electrical works. You will doubtless have to pay a premium, and during the period of apprenticeship you will earn very little money—less than 10s. a week. Sometimes it is possible to obtain a position as "improver," which means that you are fairly well versed in the technicalities of your profession, but need more practical experience. You might write for a prospectus of the Electrical Standardising, Testing and Training Institution, 8, Charing Cross Road, W.C.

Views & Reviews.

School Architecture.

Compactness has been the aim of this book; in fact the subject of school architecture may be said to have been gone through, with American expedition, in about three hundred quarto pages. We fear that for the complete enjoyment and profit of the English student some considerable knowledge of things American is required, and it is almost a question if too much has not been expected of any reader who is not a school expert, so much has been taken for granted. The book, indeed, is that of an architect in practice; of one dealing with a subject of which he has special knowledge, derived from the designing and erecting of buildings of the class of which he is writing. The collection of plans will be of interest to any all-round architect, while the expert will turn in addition to the letterpress to gather the author's views on the current fads of the day in this particular subject. The author's desire has been to deal with the schools—elementary, secondary and technical—of the principal European countries as well as of the United States, but with the limitation that they are the schools of public authorities. This at once makes the English section very one-sided and incomplete, as the examples are practically limited to School Board schools. The author seems hardly aware of the early history of English popular education, insufficiently recognising the great part taken in it by the National and Voluntary schools before and after 1870; and we must express a doubt whether he has a very close knowledge of school work in England.

The points wherein American practice differs widely from our own are of some considerable interest. The author does not appear to be altogether satisfied with American practice, and calls for certain reforms, which appear to be difficult in view of established customs. Thus, the use of the single instead of the dual desk profoundly affects classroom planning; but it is a matter which the author takes for granted as fixed. Possibly social considerations are too much involved. The unfavourable way in which the classrooms are affected is in the lighting. Rooms 28ft. deep (instead of 24ft., as in England) are found to be inadequately lit, particularly as the heights are also lower, being only 12ft. or 13ft., as compared with our 14ft. The resort to windows on a second side, to remedy this defect, is condemned by the author on account of the glare in the teacher's eyes. He calls, therefore, for a smaller number in each class, less width in the room, and greater height.

A second point in which American practice differs from our own is in the provision of a cloak-room (or "wardrobe" as it is called) for each classroom, and usually entered from it, as well as from the corridor. The author condemns English practice in this respect on the ground of the loss of time arising from confusion in the files, but this surely is a matter of school routine and discipline. Unfortunately, in the United States (probably for climatic reasons) the lavatories, or "toilets," are often in the main building, and naturally the author is anxious about the sanitation and ventilation of these places. In connection with this and the last point he dwells on the urgent importance of developing the practice of school bathing, commending the German compulsory three-times-a-week shower-bath for all scholars. To the adoption of a rule of this kind he looks for the overcoming of the trouble known as "school smell," and certainly in these days of promiscuous travelling something of the kind is much needed, not in schools only, but also for factories and building works. A revival of the working blouse—still in use abroad, by the way—would be a sensible reform.

Inadequate playgrounds the author admits to be a weak point in the United States, and the rule of 30 sq. ft. per pupil is mentioned with approval. Some landscape-gardening treatment of the school site, such as is practised abroad, according to the illustrations given, is advocated.

The treatment of elementary schools occupies about half the book: the remainder deals with secondary schools, manual training schools, and training schools for teachers, concluding with a chapter on sanitation, and about twenty pages of a specification for an American school building;

NEW PUBLIC BATHS AND WASHHOUSES, KENTISH TOWN, N.W. Thomas W. Aldwinckle and Son, Architects.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

this last will, we fear, be of little value to an English reader, as it is naturally expressed in American technicalities.

Of English secondary schools, the central school at Manchester, a proposed school at Chippenham, and the Cassland Road higher-grade Board school are given—assuredly a most inadequate treatment: but for this the limitation of the author's plan, as already mentioned, is responsible. In his eyes, in fact, English secondary education is practically non-existent. In the manual training section, the Mechanic Arts High School, Boston, designed by the author, is very fully illustrated. It appears to be magnificently fitted up, and the interior photographs show workshops that would gladden the hearts of our scientists, if they saw any prospect of getting similar ones over here. This building is in fact one of the best given. The design has far more expression of its purpose than would appear to be common in American school architecture, which seems to reproduce all the uncertainties and cross-currents of modern work in the United States.

French and German models would appear to be in favour, though it is hard to say why a free American citizen should want his children brought up in a school designed on the lines of a Continental barrack. The Croton school (p. 206), worked out on old Colonial lines, would be a good deal more wholesome to look at and to live in.

It is to be hoped the author does not give the full-page photograph of the courtyard façade of the Lycée Victor Hugo at Paris as a model for imitation. Most English students would agree that the tact and taste of the modern French architect, freely shown in the handling of masonry, absolutely deserts him in the handling of brickwork.

It is needless to add that English school architecture, as such, is badly represented in the book. The author might be advised on his next trip across to the old country to get some friendly native amongst its architects to show him round.

"School Architecture." By Edmund March Wheelwright, Fellow of the Boston Society of Architects and the American Institute of Architects. Rogers and Manson, 85, Water Street, Boston, Mass.

Stone Crosses.

This book, which is the elaboration of a paper which the author read before the local architectural society six years ago, should be read by all those who are interested in the stone crosses of Northamptonshire, especial those wonderful crosses erected to the memory of Queen Eleanor. Though the story is so well-known it will bear re-telling. Eleanor, it will be remembered, was the devoted wife of Edward I., whom she accompanied on his expeditions to Wales, Scotland and the Holy Land; and according to the legend she saved her husband's life at the siege of Acre in 1272 by sucking from his arm the poison of the assassin's dagger. Towards the end of 1290 Edward journeyed to Scotland to decide upon the rightful heir of that throne. Queen Eleanor went to meet him, but was stricken with fever on the way and died at Harby in the county of Nottingham. King Edward, "with great sorrow, for he bewailed the loss of her all the days of his life," determined to carry the remains to Westminster, and to erect a memorial cross "of wonderful size" wherever the corpse rested for the night. The distance by the old roads was about 159 miles, and it is said that the journey occupied fifteen days; but it is probable that only twelve of the crosses were actually erected. The sites of these were most likely at Lincoln, Grantham, Stamford, Geddington, Northampton, Stony Stratford, Woburn, Dunstable, St. Albans, Waltham, West Cheap and Charing. The Geddington cross (which has been twice repaired, once under the direction of the late Sir Arthur Blomfield) is generally considered to be the best of three Eleanor crosses still existing, though the Northampton cross with its beautiful statues calls for great admiration. This latter cross has been frequently restored and is now in the charge of the County Council. Besides these Eleanor crosses, the county of Northampton contains the remains of forty churchyard, ten market, twenty village and four wayside crosses, with sundry boundary stones. Among these are many fragments of Saxon work, such as the Nassington churchyard cross, while there are good examples of the Decorated and Early English periods at Raundes, Higham Ferrers, Irthlingborough and Helpston. No two are alike in design, the sockets even being quite distinct in shape and proportions. Many of the crosses have been restored at various times, though seldom successfully; but there is much beautiful work left untouched, and those who desire to study it would do well to consult this book, which is written by an authority on the archæology of Northamptonshire. There are numerous illustrations, but it is to be regretted that so many of them are such feeble specimens of draughtsmanship. The edition is limited to fifty large paper and two hundred small paper copies.

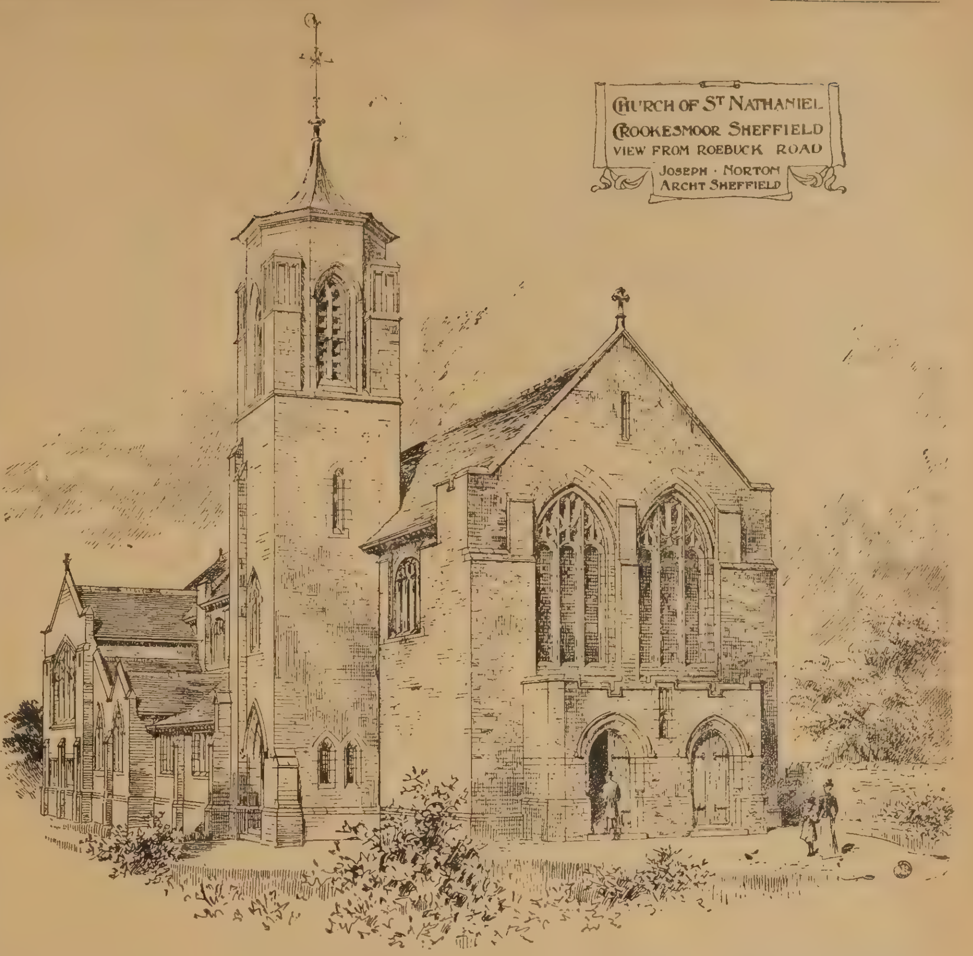
"The Stone Crosses of the County of Northampton," by Christopher A. Markham, F.S.A. London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd., 4, Stationers' Hall Court, E.C., price 10s. 6d. nett.

The Orders.

This series of ten plates is admirably produced the drawings being executed in strong line and very clearly reproduced; they measure 15in. by 20½in. Only one example of each Order is given, but the selection is a good one and sufficient for all purposes. The columns are drawn to their full height, an advantage over other publications, as it enables the general proportions to be judged better. All the Orders are drawn to a module of thirty parts, each module being equal to the semi-diameter of the column, the three Grecian examples having columns all set out to one length and the Roman to another. The details are well drawn, being shaded in line. There is a constant demand for books on the Orders, owing to the various examinations insisting on a knowledge of them.

"Classic Architecture: A Series of Ten Plates illustrating typical examples of the Grecian and Roman Orders, with full details and a selection of Grecian and Roman Ornament." By Charles F. Mitchell and George A. Mitchell. Price 6s. London: B. T. Batsford, 94, High Holborn, W.C.

The Victoria Memorial Designs will be open to public inspection at St. James's Palace on November 1st.



NEW CHURCH AT CROOKESMOOR.

THE foundation-stone of the new Church of St. Nathaniel, Crookesmoor, Sheffield, was laid recently. When finished it will seat a congregation of 700. The building fund does not permit the signing of the contract at present for the completion of the church, but the nave is to be proceeded with first, so that that portion may be ready for consecration on June 30th next year. The church is now being built, about 75 yds. from Crookesmoor Road, and on the right-hand side of Roebuck Road, on a site containing about 1,360 sq. yds. of land, with a frontage of 20 yds. to Roebuck Road, and about 12 yds. to Chatwin Street. The church can be approached from both Roebuck Road and Chatwin Street, and has five entrances, four on the Roebuck Road level to the church, and one on the Chatwin Street level to the parish room and the church. The fall between these two streets has enabled the architect to provide a room under the chancel, which might be used as a parish—or school-room and for bazaars, &c. It is 12ft. high, and will accommodate 250 persons seated. A nave, 100ft. long, 30ft., wide, and 40ft. high, with side aisles, giving altogether accommodation for about 600, is the portion now being built, and it is proposed to add a chancel and transept, giving further accommodation for about 120, with organ chamber and vestries when further funds are available, if not while the present work is going on. The materials used in the building are Dunford Bridge stone for facings, Grenoside for outer dressings, and Monk's Park Bath stone for inside work, such as the nave, arcade, font, pulpit, &c., and the roofs will be covered with green Westmoreland slates. The seating will be part chairs and part pitchpine pews, giving the ample allowance of 20in. in width and 3ft. in depth to each occupant. The style of architecture is late English Gothic, of a plain type, with traceried windows of flamboyant character, and the architect is Mr. Joseph Norton, of Sheffield. The cost of the works already contracted for is about £4,500, the total cost £7,000, and good progress is being made by the contractors, Messes. D. O'Neill & Son. The accompanying block has been kindly lent to us by the "Sheffield Daily Telegraph."

PROFESSOR WALDSTEIN ON LABOUR AND ART.

AS the second of the course of Gilchrist lectures arranged by the Ince Technical Committee, the eminent authority Mr. Charles Waldstein, Litt.D., Ph.D., L.H.D., Fellow of King's College, and late Director of the Fitzwilliam Museum, Cambridge, and of the American Archæological School, Athens, etc, took as his subject, "Labour and Art in English Life, illustrated by Greek Art."

At the outset he remarked that the subject of "the beauty in work itself," which had been developed with such eloquence and depth in bygone days by the late John Ruskin, was not the side he wished to attack that evening. He wished to be less orthodox, more heterodox, because at the commencement he wanted to make an antithesis of his own, an opposition between work and play. He desired to dwell upon the relation between work and play—in contradistinction to work. One of the most important problems of life was the sense of proportion, and it seemed to him from his point of view that he was the wisest man who was most keenly alive to the sense of proportion in this life. Most of the misery, the petty annoyances, and even the great trials of individual life, as well as the life of communities, might generally be traced back to a want of this sense of proportion.

It might appear a paradox, but every man and woman to be normal and sane should have a fad, something which should engross the playful intellectual side of activity, in contradistinction to the merely gross pursuit of collecting pounds, shillings and pence. There were many powers in their modern life which militated against the proper balancing of those two sides, and one was the great sub-division of labour.

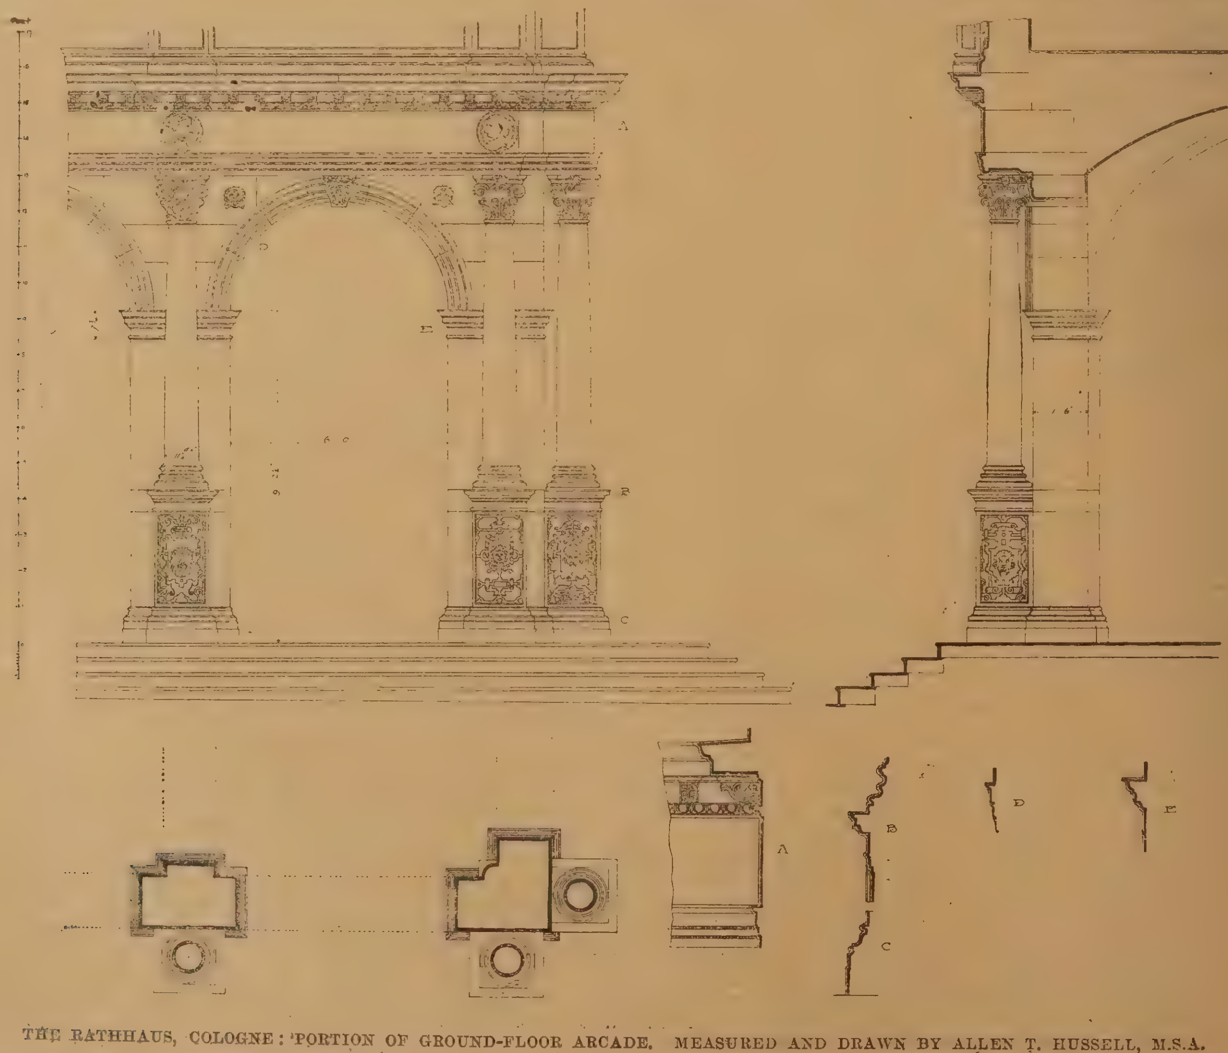
He was no romanticist, and he did not want to reproduce the simplicity of the bygone days, for they had their dark sides also. He was not dissatisfied with the present, and he was hopeful for the future. He saw nothing ugly in a factory chimney. It might be more beautiful than it is; but he could imagine a romanticist of a hundred or two hundred years hence standing before one of their ruined factory chimneys, as they at the present time stood before a ruined windmill, and referring to the beautiful days when the smoke went curling in graceful clouds from it.

Many of those who were listening to him were probably only half-an-hour previous by asking what Greek art had to do with them. But he would explain that it had much for them. The great Hellenic race was far beyond us in their just proportion of life. They were all-round beings developed on every side, strong physically, but developed normally and perfectly.

Art only required development. If they admired an apple for its rondeur and form, for its beautiful and delicate colour, that was not selfish. Develop that, and they would come to the highest art. A workman, in the selection of a pipe or stick, exercised his sense of proportion; he wanted his choice because the eye demanded it. The first and fundamental principle of all art was that of proportion and harmony, and going a step further they might call it beauty. Aristotle said, more than 2,000 years ago, that the great principle of art was the harmony between the form and the matter. In order that any of the arts might be perfect there must be complete harmony between the thing to be expressed and the form in which it was to be expressed.

At this point the lights were lowered, and a series of beautiful views of examples of Grecian art were thrown on a screen from an oxy-hydrogen lantern. They comprised examples from the very earliest times, the rudest forms of sculpture, and gradually the audience was led on to figures which gained more life and vitality as centuries rolled on. The splendid figures of the athlete throwing the discus preceded subjects more dignified, noble and restful, which reached their highest beauty in the great Attic schools of Pheidias. The Elgin marbles from the Parthenon at Athens, now deposited in the British Museum, received special attention. Many of the discoveries associated with the name of the lecturer were likewise shown; and the result of his excavations at Argos disclosed noble specimens of sculpture which exhibited the love the Grecians put into each detail of their work, although it could hardly be seen at the full height of the temple. These perfect decorations were executed 500 years B.C. A most interesting view was that of one of the marble statues found last spring by the sponge-divers in the Mediterranean, and raised with other objects from a ship which foundered in Roman times. The lecturer next spoke of the school of Lysippos, examples being given of this sculptor of the end of the 400th century B.C., when the figures employed were of slimmer and more graceful proportions than those of the preceding century. With the school of Pergamon and Rhodes came in sculptured groups which inclined to the dramatic and sensational. They represented scenes and events which could be told far better by poetry and the drama, and in these sculptured works art went beyond its bounds and really transgressed. Splendid though the studies in anatomy were, such work was obtrusive. They were anatomical studies and not the highest works of art. As art declined in this period, so did the intellectual life decline. The athletic games of the earlier and greater period of Greek history became subordinated to professionalism. To illustrate his point the lecturer had thrown upon the screen his final picture of a colossal Hercules, a mere hulk of flesh and muscle, developed and kept as prize hogs are kept, and indicative of the death of all athletic art. An eloquent warning as to the dangers of professionalism in British sport brought the lecture to a close.

The Rathhaus, Cologne.—This building has a fine Renaissance facade (date 1640) with good carving and mouldings. It is of two storeys, the upper one having slightly pointed arches not often found in buildings of this style.



THE RATHHAUS, COLOGNE: PORTION OF GROUND-FLOOR ARCADE. MEASURED AND DRAWN BY ALLEN T. HUSSELL, M.S.A.

BUILDING CONSTRUCTION.

(*Continued from p.* 134 *of No.* 347.)

16. *Friction.*—The resistance to the sliding of surfaces upon one another (fluid friction is a different thing) depends upon the nature of the surfaces and the force with which they are pressed together. Friction considered as a force is represented as μP, where μ is a number experimentally found (the coefficient of friction for the surfaces in contact) and P the pressure with which they are pressed together.

To determine μ experimentally, referring to Fig. 13:

The resolved part of W in the direction P is W cos α $\therefore$ P (pressure between the surfaces) $=$ W cos α.

The resolved part of W in the direction R is W sin α $\therefore$ R $=$ W sin α.

The force R is pulling the block down the plane and friction is opposing R. When the inclined plane is elevated till R just overcomes μP, $R = \mu P \therefore \mu = \frac{R}{P} = \tan\alpha$.

17. *Exercises.*—A, B and C (Fig. 14) suggest by their shape a roof-truss, an arched rib and a girder. The teacher, or the student for himself, should apply various systems of loading to plane rigid bodies of these shapes at the points marked by letters, or at other points, and he should by applying methods 1, 2 and 3 determine the balancing force. In this way the student will see for himself which is the best method in special circumstances. He should also practise resolving the balancing force in various ways to pass through the points of support; he will then see the effects of varying the horizontal thrust (where there is a horizontal thrust) in respect of each wall (assuming the truss to rest on side walls). In roofs the horizontal component of the balancing force appears when we take account of wind-pressure, but other forces may be applied to roofs which are not purely vertical gravitation loads.

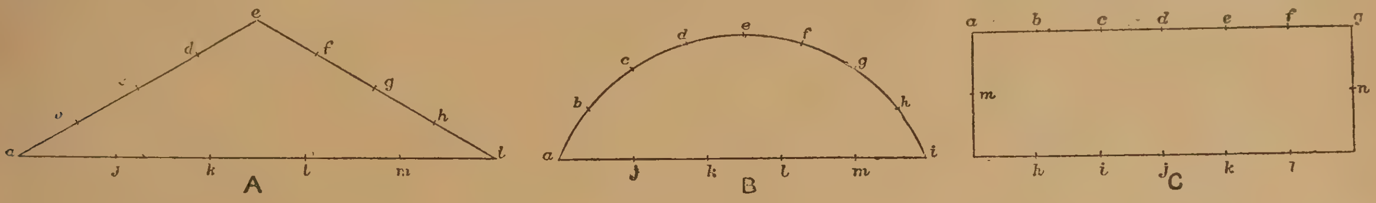


FIG. 14

FIG. 13

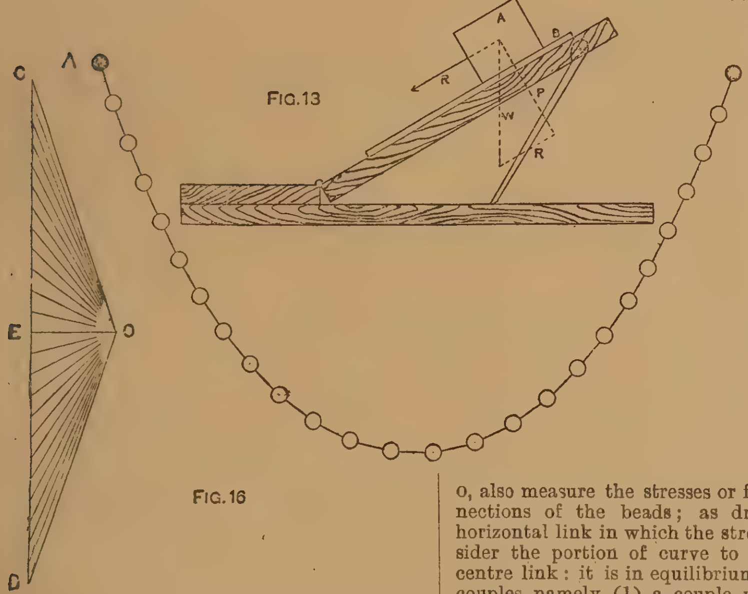

FIG. 16

I might prepare diagrams of numbers of trusses and girders variously loaded, and work them out for students to copy, but I put small value on copying diagrams as an educational exercise. Later on I shall show the usual loads upon trusses and braced girders.

18. Fig. 15 illustrates how a pair of forces nearly parallel may be conveniently compounded. It may be easily be seen that this construction will serve for parallel forces. Students should do a few exercises which they can set for themselves in compounding parallel and nearly parallel forces. Remember the lines of action are supposed to lie on a plane rigid body, and that it is the equilibrium of this body which is in question.

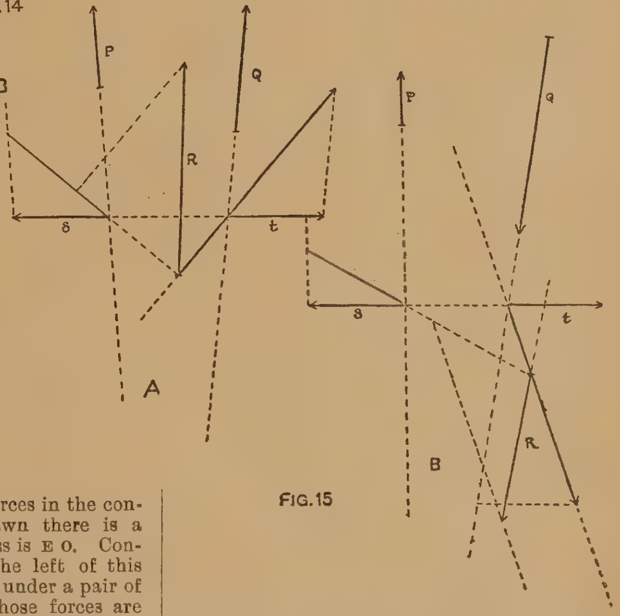

FIG. 15

19. *Loaded Strings.*—Suppose (Fig. 16) a string loaded at equal intervals, with equal beads, and hung up at two points A and B, it will take the curve shown in the figure; the slopes of the string between each pair of beads are given by the series of triangles having a common point O which show the forces at each bead. The particular curve shown is called by mathematicians a *catenary*, or chain. It is obvious that a chain will hang from two pins in a curve of this kind. The forces at each bead are in equilibrium, and their directions may be reversed so that if the little parts of the string between the beads are changed into wire, the curve with its loads might be turned upside down and the forces would still be in equilibrium. This could not be managed, because it would be a case of very *unstable* equilibrium, fine wires abutting against smooth beads and having their centres of gravity high over the points of support. But if the parts, the beads and the wires are made of reasonable cross-sectional area, and have plane joints at right angles to the curve at each joint, we can set up a structure that will stand—an arch formed of voussoirs all of equal weight. The sides of the triangles, whose common vertex is O, also measure the stresses or forces in the connections of the beads; as drawn there is a horizontal link in which the stress is E O. Consider the portion of curve to the left of this centre link: it is in equilibrium under a pair of couples, namely, (1) a couple whose forces are each equal to the weight of the curve; and (2) a couple whose forces each equal E O: this is the horizontal component of the pull upon the pin A. When the curve is set up as an arch, the arch has a thrust of this amount, and we learn that *an arch much spring from an abutment* fit not only to bear the vertical load due to the weight but also this horizonal thrust. This catenary curve is only a special case; the string may be loaded to give any curve whatever. We have found it useful (paragraph 10) in the graphic determination of balancing forces to suppose the known forces transferred from the rigid body to a string (funicular polygon); we shall find it of further use in connection with the design of arches.

Fig. 17 shows the elevation (part sectional) of a stone arch of moderate span. We take a slice of the arch parallel to its face, say 1ft. thick, and consider its strength and fitness. The string polygon below is made to fit into the centre line of a section of the voussoirs inverted. The diagram A gives the stresses in such a string, assuming the loads to be vertical. The diagram B gives the stresses when the forces are nearly at right angles to the curve. Diagram A shows how, as we go closer to the springing, if we attempt to do all the work by vertical loading, the loads needed become heavier and the stresses greater; and by no loading, however great, can we get the end element of the string vertical. This emphasises what I have already said, that every arch needs an abutment; by no arrangement of joints and by no increase of load can we get rid of the thrust of the arch. The haunching and filling distribute the load as shown in diagram B, which may fairly be taken as illustrating the condition of ordinary bridge arches of moderate spans.

The diagrams are for *dead loads.* The student may profitably exercise himself in drawing diagrams showing the changes in the polygon for the different positions of a live or changing load.

20. It is a rule that the polygon should lie within the "middle third" of the depth of the voussoirs, and I shall explain this rule. It will be useful to more closely consider the idea of the distribution of force or pressure over an area. When we push against anything with our hand our palm yields to the pressure, and a considerable area comes in contact with the surface pushed, but the pressure is not a uniformly-distributed pressure. If we set a cubical cut-glass ink-bottle on a hard surface, we shall find that though the ink-bottle is reasonably steady on a wood table it will not fit the hard surface, but will rock slightly when pressed down with the hand. The weight of the ink-bottle and the hand-pressure are communicated to the surface at three points, and the rocking results from changing directions of pressure varying one or more of the points. The reason for its not rocking on the wood is that the wood yields slightly—just as our hand does: the parts that yield most bear a greater pressure than those which yield less, and the pressure is not uniformly distributed. If we form a bed of Portland cement between the hard-surface and the cube—which we may now suppose to be a block of stone—we may assume that the cement squeezes into the slight inequalities of the surfaces, and that when this sets the pressure or weight of the cube is uniformly distributed. As we may imagine the weight of the cube as acting at its centre of gravity, we draw a line from the centre of the cube at right angles to the face on which it rests, which we assume is horizontal. This is the line of action of a force equal to the

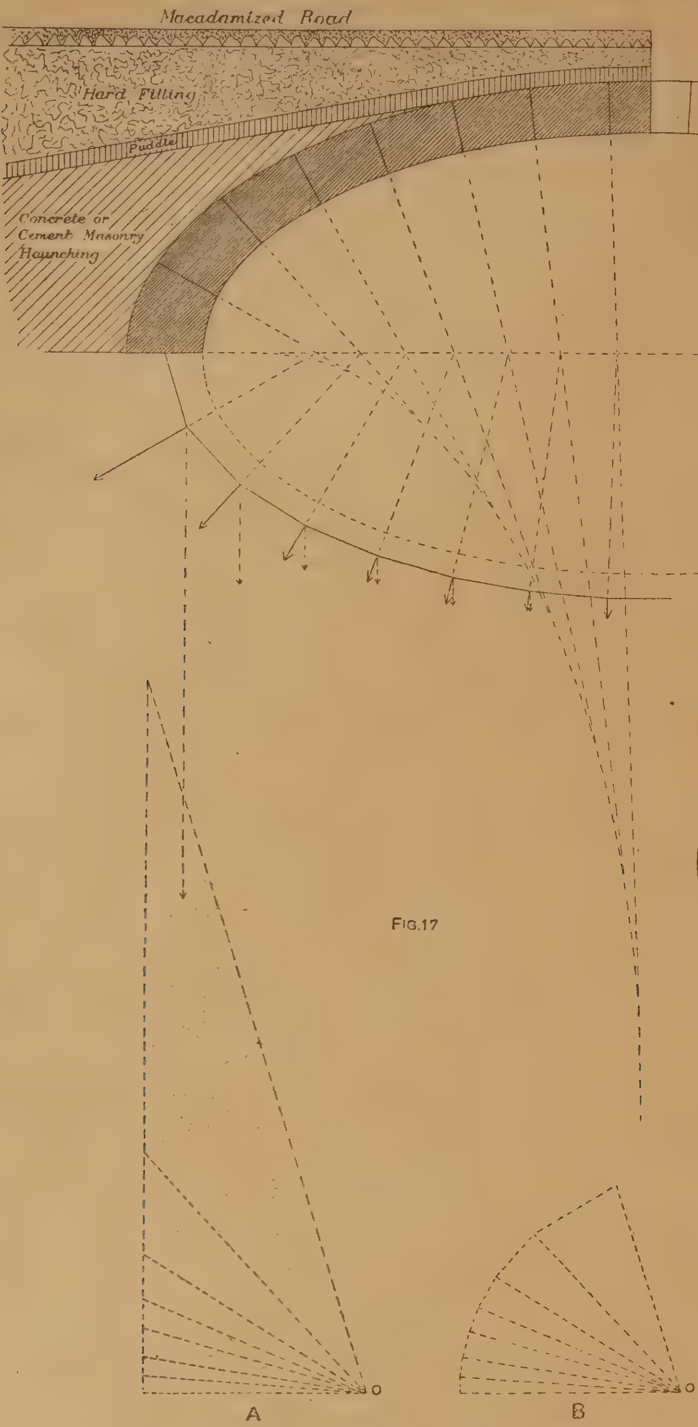

FIG. 17

FIG. 21

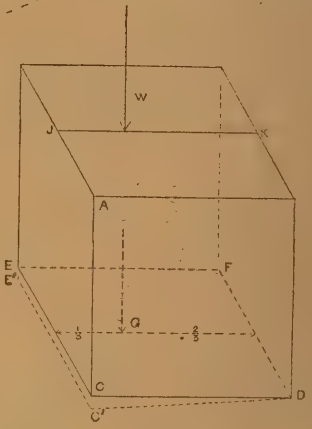

FIG. 19

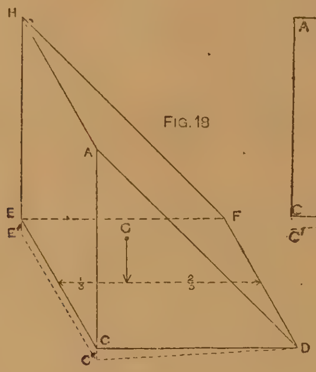

FIG. 18

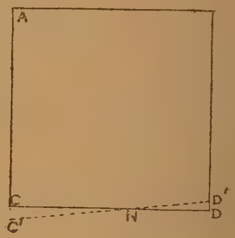

FIG. 20

weight of the cube, and we take this force to be *uniformly distributed* over the lying face of the cube. Now, if we cut the cube in half, making the section through two horizontal edges (see Fig. 18), removing the top half we shall have a wedge or prism A C D E F H remaining, whose weight is one-half that of the cube and which is now not uniformly distributed. The pressure along the line C E is the same as it was before the cube was cut, and it varies uniformly to the line F D, where it is nought. The centre of gravity of the prism A C D is vertically over a point which is one-third of the distance of E C from F D, and the distribution of pressure is that of a force equal to half the weight of the cube applied at a point G. Now, by Hooke's law every substance yields to pressure in proportion to the pressure, so that there will be some yielding along the line C E, which will uniformly get less along parallel lines as we move to D F, where it is nought. Let us again revert to the cube, and suppose we apply a vertical force W to its top surface along the line J K (Fig. 19) at such a point as that the line of action of this force, combined with the weight of the cube, will pass through the point G, we have now the same kind of distributed force that we had with the half cube, and we have the line C′D showing in an exaggerated manner the new position of C D when the compression has taken place; and because C′D lies altogether below C D the distributed force is wholly compressional. If, however, the force W is moved nearer J, the line C′D will not continue to be below C D, but will cross it at some point N (Fig 20), and the meaning of this is that the pressure per sq. in. having passed through the value nought at N changes the sign in N D′; that is, the distributed stress in this region is not compression, but it is tension, and it is exerting a pull on the cement bed here. As stonework is not supposed to bear tensional stress, care is taken to avoid the condition shown in Fig. 20. If the pressure W is very great compared with the weight of the cube, the point of application of W should not pass beyond the middle third of the cube.

21. If we consider road traffic over bridges of various spans, the traffic, or the varying load, is nearly the same for all, but the dead load varies very much. For small or common bridge spans, say up to 30ft., it adds very little to the cost to have the sheeting deep and strong. The ratio of live, or varying, load to dead load on such bridges is comparatively large. Where there is no question of *opening* for traffic through bridge arches, and where it is merely a question of economy, the designer will compare the cost of numerous piers of small size with that of a few large-size piers and heavy abutments and also that of superstructures. The wider the span the more nearly the problem becomes one to make the bridge able to carry its own weight, and consequently, for wide spans, diagrams are of great importance, as showing how to make the best distribution of the material. I am now speaking of stone bridges in which the material is all disposed so that it will have to bear compression stresses only. We here meet a subject which could not be properly dealt with in these elementary articles, but some things may be profitably said about it. It is evident to everybody that there is a limiting span for every kind of material. Why is this? Suppose we attempt to make a wider arch than Fig. 17 in the same proportions. The resistance of the material to crushing is taken to be proportional to the surfaces at the voussoir joints (or beds). The weight of the bridge increases as the *cube* of its linear dimensions, and these surfaces increase as the square, that is, at a less rapid rate. When we reach the limit for a material whose

weight bears a given ratio to its resistance to crushing, we can only bridge wider spans by adopting a material which has a smaller ratio, and our limits are very much extended when we use a material like iron or steel, which, besides having the ratio $\frac{\text{weight of a cub. in.}}{\text{crushing load per sq. in.}}$ very small, may also be depended upon to bear tensile stresses equal to the compression stresses. A steel structure of given design has also its limiting span. It is of use to designers of structures to note how animals of very different sizes, as a horse, a dog, a hare, run with nearly the same speed; or how our largest animals, as whales, live in water and are subject to the same conditions as our largest moving structures, ships. Our largest land animal, the elephant, is built like a bridge on two abutments. Our largest flying bird is of no very great weight. Why do particles of gold leaf float about in the air? Why does No. 8 shot have a much shorter range, with the same muzzle velocity, than No. 1? We sometimes see fanciful statements about the superior strength of small animals—for example, fleas—and comparison made with man. "If a man could jump as many times his own height as a flea can, and come down as safely, he could leap over high houses." A flea raises a definite mass a definite height by a definite effort. A man raises the same mass the same height by the same effort; because, if we can imagine as many fleas as would amount in weight to the weight of a man making a simultaneous jump, they would raise the common centre of gravity no higher than a man, jumping, will raise his centre of gravity.

22. The student cannot too carefully examine the reasoning of section 20. This question of distribution of pressure is very important and it has to do with many things besides the sheeting of bridges. I have taken some pains to make the explanation clear; it is slightly different from that usually given.

We can design stone arches which shall be safe for considerable spans where we can be sure of the foundations of our piers and abutments; it is manifest that any considerable unequal settlement will do away with the value of our theories of middle thirds. The student should make drawings of arches supported on piers and abutments, and investigate what will happen for various kinds of settlement. Where the foundation is in the least degree doubtful, wide-span stone arches should be avoided. It will be of great use to consider the behaviour of sheetings made up in half-brick rings under settlements of various kinds. While the sheeting is building, its weight is carried on the centres, and if the centres rest on supports independent of the piers and abutments the weight is kept off these till the centres are struck, and the striking of the centres may set up a very different condition of matters. We still speak and think of these questions under the influence of traditions of common mortar. The use of Portland cement has modified things very much, and it is worth while revising old instructions. The old question as to the propriety of bonding between intrados and extrados of sheeting in half-brick rings is practically disposed of if we build with cement mortar, using plenty of it, because we may have in this way a concrete arch with brick displacers. We must distinguish between settlement due to the strain of the material, when stressed by pressure, and the yielding of the stratum on which the structure rests. It is a good rule to carry the centres on the piers and abutments, because the weight is all the time on the foundations, and they are tested as the work proceeds. The centres of the sheeting should be struck before the spandrels are completed and the strings laid and parapets built, or these will show a sag over the crown of every arch. A critical examination of bridges will show that this last precaution is very frequently neglected. This fall of the crown, due to strain, to some extent counteracts the bad habits of masons in their endeavours to show fine joints, because it flattens the curve and consequently relieves the pressure at the face of the intrados. I am in favour of fairly rough dressing of beds and joints of stones, and of fairly thick beds and joints of cement mortar—using slow-setting cement; and of striking the centres within a moderate time of setting the keying courses, so that there may be a slight yielding of the mortar of these courses. Sheeting should be brought up simultaneously from opposite skewbacks, so that the centering will be symmetrical when strained with the weight of the stonework resting upon it. The stability of oblique arches is rendered more independent of accurate stone-cutting by the use of cement mortar.

23. Much that I have said in regard to bridge arches applies with obvious modifications to flying buttresses and vaulting. I have assumed that stone is not expected to bear a tensile stress in heavy work, but stone is frequently used in places where it is quite legitimate to make use of its power to bear tensile stress. We have seen that every arch built in the ordinary way needs an abutment, but there are circumstances in which we have to span openings in stone where it is inconvenient to have abutments; in these cases stone lintels may be used, and we shall see that beams are stressed in tension as well as compression; but it is not always easy to get long stones suitable for lintels, and I have seen (over fireplace openings especially) some beautiful examples of notching one stone into another. The pleasure I have felt from seeing instances of this kind convinces me that much of our sense of beauty is owing to our perception that the constructor has clearly understood his circumstances and honestly made the most of them.

One takes pleasure in the beautiful joggling of the despised Mahometan. I confess to feelings of anything but pleasure in examining the lintels of the stone-lintel city of Glasgow, for example. It will be observed that a great many of the stone lintels (almost all of them) are broken, and this is wholly due to unscientific building. Why will builders take precautions to prevent stone window sills breaking across, and take no precautions in regard to lintels? It will also be observed by the diligent student that there is much splintering showing on smooth ashlar in such stone cities: all this is the result of culpable carelessness. I remember examining a building in France—a church in Marseilles—in which precautions against splintering were followed to an extravagant degree. I do not advocate this for all purposes, but I confess I experienced great satisfaction in contemplating this large example of the finest ashlar masonry that I have ever seen.

24. The thrust of a dome may be taken by a hoop—I may say that I have made some use of this principle in concrete construction. I shall probably refer, further on, to combinations of cement masonry and concrete with iron. I desire to emphasize the saying "iron and Portland cement go well together" (iron does not appear to rust badly in contact with Portland cement). It is profitable to consider the stress produced in a hoop by a pressure at right angles to its inner face.

Suppose we have a hoop (Fig. 21) whose radius is R inches, and the total pressure outwards, distributed round it, is P. Suppose the pressure P prevails over the resistance of the hoop to a small distance k, so that the new radius is $R + k$, the circumference changes from $2\pi R$ to $2\pi(R + k)$ and the difference is $2\pi k$—that is, P has prevailed through a distance k, and the resistance of the hoop to stretching has been overcome through a distance $2\pi k$. By the principle of works the hoop is stressed by the force $S = \frac{P}{2\pi}$, and it must be made strong enough to withstand this stress (with a sufficient factor of safety); if the depth of the hoop be 1in. the pressure p per sq. in. is $p = \frac{P}{2\pi R}$ $\therefore$ $P = 2\pi Rp$ $\therefore$ $S = Rp$. For example, suppose $p = 50$lbs. and $R = 120$in. $S = 6{,}000$lbs., say $S = 2{\cdot}68$ tons. At 4 tons per sq. in. section the hoop should be ·67in. thick.

(To be continued.)

As a Memorial to Cardinal Newman it is proposed to erect on the site of the present Oratory Church of St. Philip Neri a worthy building. The cost of the scheme is estimated at £23,000. Mr. E. Doran Webb, F.S.A., has been entrusted with the preparation of the plans, which comprise a tower having to the right a Lady Chapel and a Chapel to St. Philip Neri, and around the church will be smaller chapels and altars. The high altar, recently presented to the Oratory Fathers, will be a feature of the new building.

New Patents.

These patents are open to opposition until November 25th.

1900.—Ventilating Rooms.—12,935. T. A. Frame, 19, Adelaide Street, and J. Hickson, 4, Nelson's Terrace, Greystone Road, both of Carlisle; and G. Goldie, 17, Cliff Villas, Manningham, Bradford. A series of holes or passages are made obliquely through the meeting bar of a sash, or in the atransom of a door having a fanlight over, so that air may be admitted without draught.

Brackets for Flushing Cisterns.—16,793. R. W. McDonald, 3, Lambeth Hill, Queen Victoria Street, E.C. Frames are attached to the brackets for the purpose of holding decorative tiles, or the brackets may have the necessary supports cast on them.

Windows.—17,008. W. K. Lee, 89, Cardiff Road, Aberdare. Each sash fits into two lifts which are connected by lines to the weights in the ordinary manner. The sashes are attached by means of a stud and thumb-screw. They can thus be removed from the frame without interfering with the cords or beads.

Decorating Wood.—20,874. E. Milo, 31, Musard Road, West Kensington, and E. J. Richardson, 41, Brook Street, Grosvenor Square, London, W. This invention relates to a process for decorating wooden surfaces with a pattern that penetrates right into the fibres, so that the wood may be washed or otherwise cleaned without injuring the design. The wood is first impregnated with alum to prevent the ink running. The design is then traced on this prepared surface, either by hand or by mechanical printing or transfers. A stain for the ground colour is then applied, after which the upper protective coating which has been used is washed off, so that the pattern appears with the clear natural colour and structure of the wood. Finally the surface is impregnated with oil.

Automatic Bricklaying.—23,084. J. H. Knight, Barfield, Farnham, Surrey. This invention relates to previous patents numbered 21,823 of 1899 and 5,169 of 1900. In order to do 14-in. work with a 9-in. machine, this latter (which consists of a hand-operated arrangement of levers and wheels working on a toothed girder) is moved laterally or transversely on a frame.

The following specifications were published on Saturday last, and are open to opposition until December 2nd. The names in italics are those of communicators of inventions. A summary of the more important of them will be given next week.

1900.—16,896, Davidson & Don, flushing cisterns. 16,960, Thorne, acetylene generators. 17,132, Stanley, manufacture of tiles, &c. 17,378, Kronstein, manufacture of varnishes. 17,496, Hirst & Bevis, ceiling roses for electric lamps. 17,743, Grundy, Grundy & Grundy, automatic water-taps. 18,822, Snyder, pipe-union. 19,535, Winkler, incandescent gas-burners. 20,290, Aston, lifts. 20,291, Musto, Musto & Jones, road scarifier. 20,453, Wayss, ceilings. 20,674, Tullis, public washhouses. 21,039, Hicks & Holmes, levels. 21,496, Friswell & British Uralite Co., Ltd., manufacture of refractory materials. 21,527 Allen, glazing of greenhouses, &c. 23,574, Stein, iron shaft-furnace for burning cement and lime.

1901.—937, Excell, drawing squares for determining slopes and batters. 2,178, Sharp & Eatwell, drying bricks and tiles. 5,370, Goodwin, doors. 7,696, Foster, valves. 9,664, Schmitt, acetylene gas apparatus. 10,844, Siepen, lime kilns. 10,930, Alton, incandescent gas lamps. 11,285, Tope, kilns. 11,504, Leroux & Carmien, apparatus for heating and incandescent lighting. 13,880, McFarland, protractors and tools for setting out metalwork such as pipe elbows. 14,463, O'Rourke, subterranean or subaqueous dam or foundation construction. 14,566, Tassain, glazing of conservatories, &c. 15,673, Haucke, paper for the photographic copying of line drawings. 16,721, Schietkiewicz, apparatus for making foundations in sandy and gravelly ground. 16,940, Pearce, locks. 17,056, Howson, flushing apparatus for water-closets. 17,162, Justice (*Mississipi Glass Co.*), apparatus for making corrugated sheet glass.

Keystones.

A New Church at St. James's, Pockthorpe, Norwich, is to be erected.

In the Old Stepney Church recently burnt down there was an ancient stone which was reputed to have belonged to the city of Carthage.

A New Board School at Blackpool is being erected in Devonshire Road to accommodate 1,046 children. The contractors are Messrs. J. Parkinson & Sons, and the architect is Mr. H. Wade.

"Where Londoners should Live" is the title of a pamphlet by W. Gilford, of Redhill, Surrey, price 3d. It consists largely of excerpts from many authorities dealing with air, sites, water and other matters. It is obtainable from the author.

A New Church at Buckland, Dover, to be dedicated to St. Barnabas, is being erected. The first portion to be ready next summer to accommodate about 250 persons will cost about £5,000. Mr. B. Ingelow, of 4, Regent Street, London, is the architect and Mr. P. W. Paramour, of Dover, the builder.

The Norman Church of Kilham, East Yorkshire, which, at the request of Archbishop Gerard, was given by Henry I. to the Dean of York, is undergoing restoration by instalments. The nave has been reseated in oak, the west window opened out, and a vestry constructed under the Norman tower. The entire scheme is to cost £2,000.

The New Royal Victoria Theatre at Wingate, erected on the site of the old theatre in Front Street, was opened recently. The new building comprises a large hall with seating accommodation for 600 persons, and a stage 33ft. by 18ft. with a 22ft. opening. There are four dressing, rooms for the artistes, all the buildings being efficiently lighted with gas.

A New Liberal Club at Shepshed is being erected. The building externally is faced with Messrs. Gibbs' red sand stocks, and will be roofed with Bromley tiles. The upper part of the front is to be half-timbered, the spaces between the timbers being filled with rough-cast. The builders are Messrs. Atkin Brothers, of Shepshed, and the architects Messrs. Barrowcliff & Allcock, of Loughborough.

The Restoration of the First Presbyterian Church, Armagh, Ireland, which has been damaged and partly blown down by storm and lightning, has been entrusted to Mr. William Brown, of 55, Beechy Street, Oldham. He has to take down about 30ft. of the damaged stonework of the spire, restore it and put a new vane and lightning-conductor on. The architect is Mr. H. C. Parkinson, of 11, College Street, Armagh, Ireland.

The New Church of St. Matthew, Willesden, was dedicated recently. A portion of the design is only as yet completed, consisting of the chancel, morning chapel, transepts, and two bays of the nave, providing accommodation for 500 people. The total cost will be about £7,000. The architect is Mr. W. D. Caröe, architect to the Ecclesiastical Commissioners. No vestries or organ chamber have been built at present, for which a sum of about £1,500 will be required.

The Roman Station of Amboglanna, the largest on the famous wall which marked the limit of the Roman province, has just been sold by auction. After an existence of 1,800 years the walls of the station, 5ft. thick, are in a wonderful state of preservation. The gateways are noble specimens of Roman work; some of the wedge-shaped stones used in the arches are still to be seen on the ground. The interior of the camp is marked with lines of streets and the ruins of buildings. The estate which claimed this was sold for £8,000.

Mattishall Church Tower.—Not long ago the fine church of All Saints', Mattishall, Norfolk, was restored at a cost of over £3,000, and the architect now reports that the tower is in such a serious condition that it may collapse at any moment. Its fall would involve the destruction of a large portion of the body of the church. Strong buttresses at the north-western angle have hitherto prevented the catastrophe, though the stair turret is in a ruinous condition. It is estimated that a sum of £800 or £1,000 would will be required to strengthen the tower.

The Church of St. Stephen's, Bournemouth, was consecrated recently. The foundation-stone was laid twenty years ago but has only recently been completed. The total cost has been nearly £30,000.

A Statue to Pasteur has been erected in the little village of Arbois. M. Dailhon is the sculptor, who made himself celebrated in connection with the decorations of the chapel in the Rue Jean Goujon, Paris.

A Correction.—In the reply given on p. 168 of our last issue, Messrs. T. A. Richardson were mentioned as the publishers of "The Art of Architectural Modelling in Paper." This is incorrect. Mr. B. T. Batsford, of 94, High Holborn, W.C., is the publisher.

Bornslay-Schnirch, the celebrated sculptor of Bohemia, has just died at the early age of fifty-six years. He executed several fine statues, but his time was chiefly occupied in decorating with statuary the public monuments of Prague. The taste and simplicity of his work gives it an air of classic dignity.

St. Peter's New Church, Oldham, has now been completed. The church stands on the site of the former one, erected in 1765, as a chapel-of-ease to St. Mary's hard by, and enlarged in 1804. It is built of flecked Runcorn stone within and without. The total cost is about £13,000, and the work has been carried out by Messrs. T. Bebbington and Son, of Oldham, from the designs and under the supervision of Messrs. Wild, Collins, and Wild, architects, of Oldham.

A "Russian Bath," recently added by the Leeds Corporation baths at Union Street, has been opened. The accommodation includes hot room, warm lavatories, shampooing room, cooling room, and dressing boxes for fifty persons. The new arrangement occupies the space formerly taken up by the first-class swimming bath. The temperature in the hot room ranges from 105 degs. to 110 degs. Fahr., and is obtained by injecting showers of steam. Mr. W. S. Braithwaite is the architect, details having been arranged by Mr. C. T. Bond.

The Antiquities from Susa sent to France by M. de Morgan (who is charged by the French Government with the work of excavating the ruins of the town where the ancient Persian kings spent their winters and deposited their treasure) have now arrived at the Louvre, and are being arranged and classified. For some three years past the French have been excavating in Persia by arrangement with the Government of Teheran and in consideration of an expenditure of 100,000fr. and a gift of Gobelins tapestry. M. de Morgan has been engaged in digging over the area originally explored by M. and Madame Dieulafoy.

Glasgow Institute of Architects.—The annual general meeting of this Institute was held on October 15th, Mr. John James Burnet, A.R.S.A., F.R.I.B.A., president, in the chair. The thirty-third annual report stated that during the past session Sir James D. Marwick, LL.D., was added to the roll of honorary members, but there had been removed from the same roll, by his death during the year, Mr. John Burnet, F.R.I.B.A., father of the president. Mr. Burnet had reached the venerable age of eighty-seven years, and was held in the highest esteem by all who knew him. During the year three names were added to the roll of ordinary members, of whom there are now seventy-two on the roll. After the president had delivered his inaugural address, the council for the ensuing year was elected.

Lectures on Chemistry of Building Materials.—A special course of ten lectures, illustrated by numerous experiments, on chemistry for builders is being given at the Battersea Polytechnic on Friday evenings at 8.30, commencing last week. The course is specially arranged for building students, and the syllabus will include the action of air on building materials, water on pipes, lime, chalk, mortar, cements, building stones, artificial stones, common metals, oils, paints and varnishes. These lectures will be followed by special lectures on the botany of building timber and practical mechanics for builders. A special course of lectures on general elementary experimental science, including the chief principles of physics and chemistry, will be given on the same evening, commencing at 7.15, and will be found of great service to building students.

The Parish Church at Loftus, Yorkshire, is to be restored.

Mr. Arnold Thornely, architect, late of 14, Castle Street, Liverpool, has removed to May Buildings, 51, North John Street, Liverpool.

As a Memorial to Queen Victoria Mr. S. J. Waring, jun., has erected a steeple at Foots Cray Church, Kent.

Maidwell Hall, Northampton, is to be Re-built. Mr. Henry Green, Northampton, is the builder; Mr. M. H. Holding, A.R.I.B.A., of Northampton the architect.

Mr. Alfred Waterhouse, R.A., who still remains at his Berkshire residence, Yattenden Court, continues to make steady progress, and has been able to receive calls from a few personal friends during the past week or two.

A Russian Guild of Artists.—A group of young artists who have finished their course of studies has founded in St. Petersburg the first guild of artists ever formed in Russia. Their object is to undertake the beautifying of churches and houses or other artistic work on contract.

The Reparation of Crowland Abbey was discontinued two years ago through lack of funds, but the rector is now endeavouring to raise £800 to continue the work. The rector, in issuing his appeal, says his aim his preservation and not restoration.

Change of Address.—Owing to the expiration of the lease of their present premises at Perchard House, 70, Gower Street, W.C., Messrs. Howgate & Keith, architects and surveyors, have removed to new offices at No. 10, Sackville Street, Piccadilly, W.

"Sanitary Architecture."—Owing to the great pressure on our space we are obliged to hold over till next week our report of the lecture on this subject delivered by Mr. Mark H. Judge, A.R.I.B.A., at the Carpenters' Hall on Thursday last.

Evening Classes in Building Construction, architectural drawing, builders' quantities and book-keeping, carpentry and joinery, staircasing and handrailing, brickwork, masonry, plasterers', painters', decorators' and plumbers' work, commence to-night at the Northern Polytechnic Institute, Holloway Road, N. The day school of technology (building trades) is also commencing. Particulars can be obtained from the principal, Mr. Reginald T. Smith, B.A.

The Glasgow Architectural Association held a meeting last week. The president, Mr. Charles E. Whitelaw occupied the chair. Mr. Alexander N. Paterson, M.A., A.R.I.B.A., delivered a lecture on "Scottish Domestic Architecture of the Seventeenth Century," showing lantern slides from the collection of Mr. John Fleming. At the close of the lecture, Mr. William J. Blain moved a vote of thanks to Messrs. Paterson and Fleming, and Mr. James Lochhead seconded. The president then announced the result of the house committee election. Mr. Thomas Ramsay was appointed in place of Mr. Hugh Dale, who retires. The house committee for the session are Messrs. Charles E. Whitelaw, William J. Blain and Thomas Ramsay.

Building Sites and Fever. — The conditions which apparently are responsible for the outbreak of scarlet fever in the Horton Grange district of Bradford are not without parallel elsewhere, says the "Lancet," while they show that the attention of local authorities when directed to new buildings erected in their districts should not be confined to the details of the structures to be erected. Dr. W. A. Evans, the medical officer of health of Bradford, has informed the health committee of the corporation that the outbreak is, in his opinion, due to the "tipping system," resorted to for filling up depressions in ground which is destined to be built upon. "Tipping," or "dumping" as they say in America, ashpit refuse from the neighbouring urban district it is quite clear is about as unsuitable a soil to build dwelling-houses upon as could be invented. Ashpit refuse naturally subsides unevenly under the weight of a house, with the result that drain pipes are broken and displaced. The Bradford Health Committee hope that the cleansing committee will discontinue the practice of tipping refuse in the neighbourhood, and also hope that the building committee will insist upon precautions such as concrete floors where refuse is built upon.

In the Churchyard of All Hallows, London Wall, E.C., it is proposed to built a permanent shelter for men who, in order to take advantage of the early cheap trains, arrive in the City long before the time they are due at their places of business. The building will include a comfortable waiting-room and a library. It will cost about £1,000.

The New Home for Lloyd's Registry of Shipping in Fenchurch Street, E.C., which was commenced three years ago, and will be completed in three months from this date, was visited recently by the members of the British Institute of Carpenters. The exterior is entirely composed of Portland stone. Mr. Fagan has sculptured for the board-room a white marble group representing commerce and shipping. Over £70,000 was paid for the site, and £100,000 is being spent on the building. Mr. T. E. Collcutt is the architect.

The Northern Architectural Association recently visited the new premises of the Newcastle Breweries, Ltd., in the Haymarket, and the electrical power station for the new tramways in City Road. Mr. Joseph Oswald, of the firm of Messrs. Oswald & Son, from whose designs the Breweries Company's premises have been erected by Messrs. Walter Scott & Co., building contractors, of Newcastle, acted as guide to the inspecting party, among whom were Mr. F. Rule, the president of the association, and Mr. Plummer, the hon. secretary. The building is lavishly decorated from the basement to the top floor. The visit to the electrical-power station of the Corporation in City Road was brief. Mr. Simpson pointed out the architectural features of the structure, while Mr. Rossignol rendered a similar service in respect of the machinery.

Edinburgh Architectural Societies Amalgamate.—The annual general meeting of the Edinburgh Architectural Association was held on Wednesday last. The members of the Edinburgh Architectural Society attended, and the two societies were amalgamated under the name of the old body, which has been in existence for forty-three years. The following office-bearers were then elected:—President, Mr. Henry F. Kerr; vice-presidents, Mr. A. Hunter Crawford and Mr. A. Lorne Campbell; secretaries, Mr. W. M. Page and Mr. C. B. Cownie; treasurer, Mr. John Johnstone, C.A.; librarian, Mr. John Watson; convener of publication committee, Mr. G. S. Aitken; and the following members of committee: Mr. James Bruce, W.S., Mr. Thomas Ross, Mr. George Henderson, Mr. Hay Lamont, Mr. A. Greig and Mr. Balfour Paul.

The Albert Memorial was recently stated to be in a deplorable condition, the mosaic falling off, some of the statuettes disfigured through neglect, and the railings and gates in a worse condition than the monument. Lord Esher, of His Majesty's Office of Works denies this. He says: "Since the monument was erected there have at times been small showers of powder from the mosiac. The statuary is all in excellent order. It is a matter of taste, but the gilding of the monument is thought by many to be in better taste now than when originally erected. To regild would give it a tawdry appearance, which might appeal to some people, but is resented by others. The railings are not in good order, and have been the subject of much anxious consideration. Their treatment is under the consideration of outside experts, whose opinion the First Commissioner of Works is awaiting."
